Identification—Transfer a portion of powdered Tablets, equivalent to about 100 mg of oxprenolol hydrochloride, to a suitable test tube containing 5 mL of water. Shake this mixture for about 1 minute and allow it to settle. Use the clear supernatant as the test solution. Prepare a Standard solution containing 20 mg of USP Oxprenolol Hydrochloride RS per mL. Apply separate 1- μ L portions of the test solution and of the Standard solution to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Line a suitable chromatographic chamber with filter paper, saturate the paper with the developing solvent consisting of a mixture of ethyl acetate, glacial acetic acid, and water (15:5:5), and allow to stand for about 30 minutes. Place the plate in the chamber, and develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, and dry at 100° for 15 minutes. Spray the plate uniformly with a detection reagent consisting of a freshly prepared mixture of equal volumes of potassium ferricyanide solution (1 in 100) and ferric chloride solution (1 in 5). Dry the plate in a current of warm air for about 5 minutes. Examine the chromatograms in ordinary light: the R_f value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

Dissolution (711)—

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 1: 100 rpm.

Time: 30 minutes.

Procedure—Determine the amount of $C_{15}H_{23}NO_3 \cdot HCl$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 272 nm of filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Oxprenolol Hydrochloride RS in the same medium.

Tolerances—Not less than 80% (Q) of the labeled amount of $C_{15}H_{23}NO_3 \cdot HCl$ is dissolved in 30 minutes.

Uniformity of dosage units (905): meet the requirements.

Assay—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 80 mg of oxprenolol hydrochloride, to a 100-mL volumetric flask. Add 80 mL of a *Diluting solvent*, which consists of a mixture of methanol and 0.1 N hydrochloric acid (9:1), and shake by mechanical means for 1 hour. Dilute with *Diluting solvent* to volume, and mix. Filter, discarding the first 10 mL of the filtrate, transfer 25.0 mL of the clear filtrate to a 200-mL volumetric flask, dilute with *Diluting solvent* to volume, and mix. Concomitantly determine the absorbances of this assay solution and a Standard solution of USP Oxprenolol Hydrochloride RS in the same solvent having a known concentration of about 0.1 mg per mL at the wavelength of maximum absorbance at about 274 nm and, in addition, at 300 nm, using *Diluting solvent* as the blank. Calculate the quantity, in mg, of

$C_{15}H_{23}NO_3 \cdot HCl$ in the portion of Tablets taken by the formula:

$$800C(A_U / A_S)$$

in which C is the concentration, in mg per mL, of USP Oxprenolol Hydrochloride RS in the Standard solution, and A_U and A_S are the differences between the absorbances at 274 nm and 300 nm of the assay solution and the Standard solution, respectively.

Oxprenolol Hydrochloride Extended-Release Tablets

» Oxprenolol Hydrochloride Extended-Release Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of oxprenolol hydrochloride ($C_{15}H_{23}NO_3 \cdot HCl$).

Packaging and storage—Preserve in well-closed, light-resistant containers.

USP Reference standards (11)—

USP Oxprenolol Hydrochloride RS

Identification—Tablets respond to the *Identification* test under *Oxprenolol Hydrochloride Tablets*.

Dissolution (711)—

Acid medium: 0.1 N hydrochloric acid; 900 mL.

Dissolution medium: simulated intestinal fluid TS (without enzyme); 900 mL.

Apparatus 1: 100 rpm.

Times: 1 hour in *Acid medium*; 1, 3, and 7 hours in *Dissolution medium*.

Procedure—Determine the amount of $C_{15}H_{23}NO_3 \cdot HCl$ dissolved from UV absorbances at the wavelength of maximum absorption at about 272 nm on the first solution under test, suitably diluted with *Acid medium*, in comparison with a Standard solution having a known concentration of USP Oxprenolol Hydrochloride RS in the same medium. Promptly transfer the basket containing the Tablet to *Dissolution medium*. After 1, 3, and 7 hours, respectively, remove 9.0 mL of the test solution and determine the amount of $C_{15}H_{23}NO_3 \cdot HCl$ dissolved from UV absorbances at the wavelength of maximum absorption at about 272 nm on the solution under test, suitably diluted with *Dissolution medium*, in comparison with a Standard solution having a known concentration of USP Oxprenolol Hydrochloride RS in the same medium. [NOTE—Replace the aliquots withdrawn for analysis with fresh portions of *Dissolution medium*.]

Tolerances—The percentages of the labeled amount of $C_{15}H_{23}NO_3 \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1, in <i>Acid medium</i>	between 15% and 45%
1, in <i>Dissolution medium</i>	between 30% and 60%
3, in <i>Dissolution medium</i>	between 50% and 80%
7, in <i>Dissolution medium</i>	not less than 75%

Uniformity of dosage units (905): meet the requirements.

Procedure for content uniformity—Proceed as directed for *Procedure for the content uniformity* in the test for *Uniformity of dosage units* under *Oxprenolol Hydrochloride Tablets*.

Assay—Determine the mean value of the $C_{15}H_{23}NO_3 \cdot HCl$ contents of the Tablets as directed for *Uniformity of dosage units* under *Oxprenolol Hydrochloride Tablets*.

Oxtriphylline

$C_{12}H_{21}N_5O_3$ 283.33
 Ethanaminium, 2-hydroxy-N,N,N-trimethyl-, salt with 3,7-dihydro-1,3-dimethyl-1H-purine-2,6-dione;
 Choline salt with theophylline (1:1) [4499-40-5].

DEFINITION

Oxtriphylline contains NLT 61.7% and NMT 65.5% of anhydrous theophylline ($C_7H_8N_4O_2$), calculated on the dried basis.

IDENTIFICATION

- **A.**
Sample solution: 50 mg/mL in water
Analysis: To 10 mL of the *Sample solution* add 5 mL of mercuric-potassium iodide TS.
Acceptance criteria: A pale yellow precipitate is formed (presence of choline).
- **B.**
Sample solution: 50 mg/mL in water
Analysis: To 10 mL of the *Sample solution* add 5 drops of 6 N ammonium hydroxide and 5 mL of silver nitrate TS.
Acceptance criteria: A gelatinous precipitate is formed, and it coagulates on heating (presence of theophylline).

ASSAY

• THEOPHYLLINE

Sample solution: The solution retained in the test for *Choline Content*

Analysis: Add 35 mL of silver nitrate TS to the *Sample solution*, and swirl gently to promote complete precipitation. Titrate with 0.1 N sodium hydroxide VS to a green endpoint. Each mL of 0.1 N sodium hydroxide is equivalent to 18.02 mg of theophylline ($C_7H_8N_4O_2$).

Acceptance criteria: 61.7%–65.5% on the dried basis

OTHER COMPONENTS

• CHOLINE CONTENT

Indicator solution: Dissolve 30 mg of methyl red in 100 mL of methanol, and add 15 mL of methylene blue solution (1 in 1000).

Sample solution: 900 mg of Oxtriphylline in 50 mL of water

Analysis: Add 4 drops of *Indicator solution* to the *Sample solution*, and titrate with 0.1 N sulfuric acid VS to a purple endpoint. Each mL of 0.1 N sulfuric acid is equivalent to 12.12 mg of choline ($C_5H_{15}NO_2$). Retain the final solution for the *Assay for Theophylline*.

Acceptance criteria: The content of choline ($C_5H_{15}NO_2$) is between 652 and 693 mg/g of theophylline ($C_7H_8N_4O_2$) found in the *Assay*.

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.3%
- **CHLORIDE AND SULFATE**, *Chloride* (221)
Standard: 0.15 mL of 0.020 N hydrochloric acid
Sample: 0.50 g
Acceptance criteria: 0.02%; the *Sample* shows no more chloride than corresponds to the *Standard*.

• ORDINARY IMPURITIES (466)

Standard solution: Chloroform, alcohol, and formic acid (88:10:2)

Sample solution: Chloroform, alcohol, and formic acid (88:10:2)

Eluent: Chloroform, alcohol, and formic acid (88:10:2)

Visualization: 1

Acceptance criteria: Meets the requirements

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE**, *Class I* (741):

185°–189°

- **LOSS ON DRYING** (731)

Analysis: Dry at 80° for 4 h.

Acceptance criteria: NMT 1.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

- **USP REFERENCE STANDARDS** (11)

USP Oxtriphylline RS

Oxtriphylline Oral Solution

DEFINITION

Oxtriphylline Oral Solution contains an amount of Oxtriphylline equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of anhydrous theophylline ($C_7H_8N_4O_2$).

IDENTIFICATION

- **A.** The retention time of the theophylline peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

- **B.**

Sample solution: Place a volume of Oral Solution, equivalent to 100 mg of oxtriphylline, in a 60-mL separator containing 1 mL of glacial acetic acid and 40 mL of chloroform. Shake for 1 min, allow the phases to separate, and filter the lower phase through dry cotton into a 100-mL beaker.

Analysis: Transfer a portion of the *Sample solution*, equivalent to 10 mg of oxtriphylline, to a porcelain dish, and evaporate on a steam bath with the aid of a current of dry air to dryness. Add 1 mL of hydrochloric acid and 100 mg of potassium chlorate. Evaporate on a steam bath to dryness, and invert the dish over a vessel containing a few drops of 6 N ammonium hydroxide.

Acceptance criteria: The residue acquires a purple color.

ASSAY

• PROCEDURE

Buffer: 6.8 g/L of monobasic potassium phosphate in water. Adjust with 0.1 N potassium hydroxide to a pH of 5.8 ± 0.1 .

Mobile phase: Methanol and *Buffer* (1:4)

System suitability solution: 60 µg/mL of USP Oxtriphylline RS and 30 µg/mL of theobromine in water

Standard solution: 0.1 mg/mL of USP Oxtriphylline RS in water

Sample solution: Nominally 0.1 mg/mL of oxtriphylline, equivalent to 0.0636 mg/mL of theophylline, prepared by diluting Oral Solution with water

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 275 nm

Column: 3.9-mm × 30-cm; packing L1

Flow rate: 1 mL/min

Injection volume: 10 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for theobromine and theophylline are about 0.7 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 3.0 between the theobromine and theophylline peaks, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of theophylline ($C_7H_8N_4O_2$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of theophylline from the *Sample solution*

r_S = peak response of theophylline from the *Standard solution*

C_S = concentration of USP Oxtriphylline RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of theophylline in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of anhydrous theophylline, 180.17

M_{r2} = molecular weight of oxtriphylline, 283.33

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

• **pH** (791): 6.4–9.0

• **ALCOHOL DETERMINATION, Method I** (611) (if present): 90.0%–115.0% of the labeled amount, the labeled amount being NMT 20.0% of alcohol (C_2H_5OH)

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label Oral Solution to state both the content of oxtriphylline and the content of anhydrous theophylline.
- **USP REFERENCE STANDARDS** (11)
USP Oxtriphylline RS

Oxtriphylline Tablets

DEFINITION

Oxtriphylline Tablets contain an amount of Oxtriphylline equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of anhydrous theophylline ($C_7H_8N_4O_2$).

IDENTIFICATION

- **A.** The retention time of the theophylline peak of the *Sample solution* corresponds to that of the *Standard solution*, obtained as directed in the *Assay*.

ASSAY

• PROCEDURE

Buffer: 6.8 g/L of monobasic potassium phosphate in water. Adjust with 0.1 N potassium hydroxide to a pH of 5.8 ± 0.1 .

Mobile phase: Methanol and *Buffer* (1:4)

System suitability solution: 60 µg/mL of USP Oxtriphylline RS and 30 µg/mL of theobromine in water

Standard solution: 0.1 mg/mL of USP Oxtriphylline RS in water

Sample stock solution: Place 10 Tablets in a 1000-mL volumetric flask, and add 700 mL of water. Heat on a steam bath, with occasional shaking, until the Tablets have disintegrated. Cool to room temperature, dilute with water to volume, and filter.

Sample solution: Nominally 0.1 mg/mL of oxtriphylline, equivalent to 0.0636 mg/mL of theophylline, prepared by diluting the *Sample stock solution* with water

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 275 nm

Column: 3.9-mm × 30-cm; packing L1

Flow rate: 1 mL/min

Injection volume: 10 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for theobromine and theophylline are about 0.7 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 3.0 between the theobromine and theophylline peaks, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of theophylline ($C_7H_8N_4O_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of theophylline from the *Sample solution*

r_S = peak response of theophylline from the *Standard solution*

C_S = concentration of USP Oxtriphylline RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of theophylline in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of anhydrous theophylline, 180.17

M_{r2} = molecular weight of oxtriphylline, 283.33

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Time: 30 min

Standard solution: Prepare a solution having a known concentration of USP Oxtriphylline RS in *Medium*.

Sample solution: A filtered portion of the solution under test, suitably diluted with *Medium* if necessary

Instrumental conditions

Mode: UV

Analytical wavelength: Maximum at about 270 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Determine the percentage of the labeled amount of theophylline ($C_7H_8N_4O_2$) dissolved.

Tolerances: NLT 80% (Q) of the labeled amount of theophylline ($C_7H_8N_4O_2$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label Tablets to state both the content of oxtriphylline and the content of anhydrous theophylline.
- **USP REFERENCE STANDARDS** (11)
USP Oxtriphylline RS

Oxtriphylline Extended-Release Tablets

DEFINITION

Oxtriphylline Extended-Release Tablets contain an amount of Oxtriphylline equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of anhydrous theophylline ($C_7H_8N_4O_2$).

IDENTIFICATION

- **A.** The retention time of the theophylline peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

- **B. THIN-LAYER CHROMATOGRAPHY**

Standard solution: 10 mg/mL of USP Oxtriphylline RS in methanol

Sample solution: Nominally 10 mg/mL of oxtriphylline prepared as follows. Transfer a quantity of finely ground Tablets, equivalent to 100 mg of oxtriphylline, to a suitable test tube. Add 10 mL of methanol, shake on a vortex mixer for several min, and filter.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 10 μ L

Developing solvent system: Chloroform, alcohol, and formic acid (88:10:2)

Analysis

Samples: *Standard solution* and *Sample solution*

Develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Observe the plate under short-wavelength UV light.

Acceptance criteria: The principal spot of the *Sample solution* corresponds in color, size, and R_f value to that of the *Standard solution*.

ASSAY

- **PROCEDURE**

Buffer: 6.8 g/L of monobasic potassium phosphate in water. Adjust with 0.1 N potassium hydroxide to a pH of 5.8 ± 0.1 .

Mobile phase: Methanol and *Buffer* (1:4)

System suitability solution: 60 μ g/mL of USP Oxtriphylline RS and 30 μ g/mL of theobromine in water

Standard solution: 0.1 mg/mL of USP Oxtriphylline RS in water

Sample stock solution: Place 10 Tablets in a 1000-mL volumetric flask. Add 700 mL of water, and heat on a steam bath, with occasional shaking, until the Tablets have disintegrated. Cool to room temperature, dilute with water to volume, and filter.

Sample solution: Nominally 0.1 mg/mL of oxtriphylline, equivalent to 0.0636 mg/mL of theophylline, prepared by diluting the *Sample stock solution* with water

Flow rate: 1 mL/min

Injection volume: 20 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 0.73%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of oxybenzone (C₁₄H₁₂O₃) in the portion of Oxybenzone taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Oxybenzone RS in the *Standard solution* (mg/mL)

C_U = concentration of Oxybenzone in the *Sample solution* (mg/mL)

Acceptance criteria: 97.0%–103.0% on the dried basis

SPECIFIC TESTS

- **CONGEALING TEMPERATURE (651):** NLT 62.0°

- **LOSS ON DRYING (731)**

Analysis: Dry a sample in a vacuum at 40° for 2 h.

Acceptance criteria: NMT 2.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS (11)**
USP Oxybenzone RS

Oxybutynin ChlorideC₂₂H₃₁NO₃ · HCl

393.95

Benzeneacetic acid, α-cyclohexyl-α-hydroxy-, 4-(diethylamino)-2-butynyl ester hydrochloride, (±)-;
4-(Diethylamino)-2-butynyl (±)-α-phenylcyclohexaneglycolate hydrochloride [1508-65-2].

DEFINITION

Oxybutynin Chloride contains NLT 97.0% and NMT 102.0% of oxybutynin chloride (C₂₂H₃₁NO₃ · HCl), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY**• PROCEDURE**

Buffer: A solution containing 6.67 g/L of monobasic potassium phosphate and 8.55 g/L of dibasic potassium phosphate

Mobile phase: Acetonitrile and *Buffer* (49:51)

Standard solution: 0.1 mg/mL of USP Oxybutynin Chloride RS in *Mobile phase*

Sample solution: 0.1 mg/mL of Oxybutynin Chloride in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 7.5-cm; 3-μm or 3.5-μm packing L7

Column temperature: 45°

Flow rate: 1 mL/min

Injection volume: 10 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 1.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of oxybutynin chloride (C₂₂H₃₁NO₃ · HCl) in the portion of Oxybutynin Chloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_s = concentration of USP Oxybutynin Chloride RS in the *Standard solution* (mg/mL)

C_u = concentration of Oxybutynin Chloride in the *Sample solution* (mg/mL)

Acceptance criteria: 97.0%–102.0% on the dried basis

OTHER COMPONENTS

• CHLORIDE CONTENT

Sample: 600 mg of Oxybutynin Chloride, previously dried

Analysis: Dissolve the *Sample* in 100 mL of water, and add 5 mL of nitric acid. Titrate (see *Titrimetry* (541)) with 0.1 N silver nitrate VS, using a platinum–silver chloride electrode system. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of chloride (Cl).

Acceptance criteria: 8%–10%

IMPURITIES

• RESIDUE ON IGNITION (281): NMT 0.1%

Delete the following:

• HEAVY METALS, Method I (231): NMT 20 ppm (Official 1: Jan-2018)

• ORGANIC IMPURITIES

Buffer, Mobile phase, and Chromatographic system: Proceed as directed in the *Assay*.

System suitability stock solution: 100 µg/mL each of USP Oxybutynin Related Compound B RS and USP Oxybutynin Related Compound C RS in *Mobile phase*

Standard stock solution: 1.0 mg/mL of USP Oxybutynin Chloride RS in *Mobile phase*

System suitability solution: Transfer 10.0 mL of the *System suitability stock solution* to a 100-mL volumetric flask, add 10.0 mL of *Standard stock solution*, and dilute with *Mobile phase* to volume.

Standard solution: 7.5 µg/mL of USP Oxybutynin Chloride RS from *Standard stock solution* in *Mobile phase*

Sample solution: 5.0 mg/mL of Oxybutynin Chloride in *Mobile phase*

System suitability

Sample: *System suitability solution*

[NOTE—See Table 1 for relative retention times.]

Suitability requirements

Resolution: NLT 1.1 between oxybutynin related compound B and oxybutynin related compound C

Relative standard deviation: NMT 2.0% for the oxybutynin peak

Analysis

Samples: *Standard solution* and *Sample solution*

Record the chromatograms for a total time of NLT twice the retention time of the oxybutynin peak.

Calculate the percentage of each impurity in the portion of Oxybutynin Chloride taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times (1/F) \times 100$$

r_u = peak response of each impurity from the *Sample solution*

r_s = peak response of oxybutynin from the *Standard solution*

C_s = concentration of USP Oxybutynin Chloride RS in the *Standard solution* (mg/mL)

C_u = concentration of Oxybutynin Chloride in the *Sample solution* (mg/mL)

F = relative response factor for each impurity (see Table 1)

Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Oxybutynin related compound A ^a	0.08	1.4	0.5
Diphenyl analog of oxybutynin chloride ^b	0.37	2.7	0.1
Oxybutynin related compound B ^c	0.65	1.3	1.0
Oxybutynin related compound C ^d	0.79	1.0	1.0
Oxybutynin	1.0	—	—
Cyclohexenyl analog of oxybutynin chloride ^e	1.8	0.4	1.0
Ethylpropyl analog of oxybutynin chloride ^f	1.9	1.0	0.1
Any other individual impurity	—	1.0	0.1
Total impurities	—	—	1.0

^a Phenylcyclohexylglycolic acid (cyclohexylmandelic acid, or CHMA).

^b 4-(Diethylamino)but-2-ynyl 2-hydroxy-2,2-diphenylacetate.

^c Methyl ester of phenylcyclohexylglycolic acid (methyl ester of cyclohexylmandelic acid, or CHMME).

^d Methylethyl analog of oxybutynin chloride (4-(ethylmethylamino) but-2-ynyl (±)-2-cyclohexyl-2-hydroxy-2-phenylacetate).

^e 4-(Diethylamino)but-2-ynyl (±)-2-(cyclohex-3-enyl)-2-cyclohexyl-2-hydroxyacetate.

^f 4-(Ethylpropylamino)but-2-ynyl (±)-2-cyclohexyl-2-hydroxy-2-phenylacetate.

SPECIFIC TESTS

• LOSS ON DRYING (731)

Analysis: Dry a sample at 105° for 2 h.

Acceptance criteria: NMT 3%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• USP REFERENCE STANDARDS (11)

USP Oxybutynin Chloride RS

USP Oxybutynin Related Compound B RS

Methyl ester of phenylcyclohexylglycolic acid, or CHMME (cyclohexyl mandelic acid methyl ester).

USP Oxybutynin Related Compound C RS

Methylethyl analog of oxybutynin chloride, or 4-(ethylmethylamino) but-2-ynyl (±) 2-cyclohexyl-2-hydroxy-2-phenylacetate hydrochloride.

Oxybutynin Chloride Oral Solution

» Oxybutynin Chloride Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{22}H_{31}NO_3 \cdot HCl$.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Oxybutynin Chloride RS

Identification—Place a volume of Oral Solution, equivalent to about 50 mg of oxybutynin chloride, in a separator, and extract with 10 mL of chloroform. The extract so obtained responds to the *Thin-Layer Chromatographic Identification Test* (201), methanol being used as the developing solvent, and iodine vapor being used to visualize the spots.

Assay—

pH 4 Phosphate buffer—Place 38 mL of 0.2 M dibasic sodium phosphate in a 100-mL volumetric flask. Dilute with 0.1 M citric acid to volume, and mix. Adjust the pH, if necessary, with either the dibasic sodium phosphate solution or the citric acid solution.

pH 5.6 Phosphate buffer—Place 58 mL of 0.2 M dibasic sodium phosphate in a 100-mL volumetric flask. Dilute with 0.1 M citric acid to volume, and mix. Adjust the pH, if necessary, with either the dibasic sodium phosphate solution or the citric acid solution.

Bromocresol green solution—Transfer 125 mg of bromocresol green to a 25-mL volumetric flask, dissolve in 3.5 mL of 0.05 N sodium hydroxide, dilute with water to volume, and mix.

Standard preparation—Dissolve an accurately weighed quantity of USP Oxybutynin Chloride RS in 0.05 N sulfuric acid to obtain a solution having a known concentration of about 100 µg per mL.

Assay preparation—Transfer an accurately measured volume of Oral Solution, equivalent to about 10 mg of oxybutynin chloride, to a 100-mL volumetric flask, dilute with water to volume, and mix.

Procedure—Separately transfer 10.0 mL of the *Standard preparation* and the *Assay preparation* to separate 125-mL separators. Add 20 mL of pH 4 Phosphate buffer to each separator, and extract each solution with a 25-mL portion of chloroform. [NOTE—Allow at least 10 minutes for the layers to separate.] Collect the chloroform extracts in respective 125-mL separators, each containing a mixture of 2 mL of pH 5.6 Phosphate buffer and 1 mL of Bromocresol green solution. Shake the separators, and filter the chloroform extracts through rayon pledgets, collecting the extracts in respective 100-mL volumetric flasks. Repeat the double extractions with 25-mL portions of chloroform. Wash the rayon pledgets with chloroform, collecting the washings in the respective 100-mL volumetric flasks. Dilute both solutions with chloroform to volume, and mix. Concomitantly determine the absorbances of both solutions at the wavelength of maximum absorbance at about 415 nm, with a suitable spectrophotometer, against a blank prepared using 10 mL of 0.05 N sulfuric acid treated in the same manner as the *Standard preparation* and the *Assay preparation*. Calculate the quantity, in mg, of $C_{22}H_{31}NO_3 \cdot HCl$ in each mL of Oral Solution taken by the formula:

$$(0.1C / V)(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Oxybutynin Chloride RS in the *Standard preparation*; V is the volume, in mL, of Oral Solution taken; and A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

Oxybutynin Chloride Tablets

DEFINITION

Oxybutynin Chloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of $C_{22}H_{31}NO_3 \cdot HCl$.

IDENTIFICATION

- **THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)**

Sample solution: Add a portion of powdered Tablets, equivalent to about 50 mg of oxybutynin chloride, to 10 mL of chloroform. Mix for two minutes, and centrifuge. Use the supernatant layer.

Developing solvent system: Methanol

Visualization: Iodine vapor

ASSAY

- **PROCEDURE**

Solution A: Methanol, water, and triethylamine (800:3200:0.9). Adjust with phosphoric acid to a pH of 3.5 ± 0.05 .

Mobile phase: Acetonitrile and Solution A (1:4)

Standard solution: 0.05 mg/mL of USP Oxybutynin Chloride RS in *Mobile phase*

Sample solution: Transfer an amount of powdered Tablets (from NLT 20 Tablets) nominally equivalent to 50 mg of oxybutynin chloride to a 1000-mL volumetric flask. Add about 400 mL of *Mobile phase*, sonicate for about 10 min, shake by mechanical means for about 45 min, and dilute with *Mobile phase* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 203 nm

Column: 4-mm × 30-cm; packing L10

Flow rate: 2 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $C_{22}H_{31}NO_3 \cdot HCl$ in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Oxybutynin Chloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **DISSOLUTION (711)**

Test 1

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Time: 30 min

Sample solution: Pass a portion of the solution under test through a suitable 0.45-µm filter. Dilute with *Medium* if necessary.

Analysis: Determine the amount of $C_{22}H_{31}NO_3 \cdot HCl$ dissolved using the method set forth in the *Assay*, making any necessary modifications to the concentration of the *Standard solution* to correspond to that of the solution under test and injecting 100 µL of both solutions.

Tolerances: NLT 80% (Q) of the labeled amount of $C_{22}H_{31}NO_3 \cdot HCl$ is dissolved.

Test 2: If the products complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: 0.01 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 30 min

Standard solution: 5 µg/mL of USP Oxybutynin Chloride RS in *Medium*. This solution is stable for 5 days at ambient conditions.

Sample solution: Pass a portion of the solution under test through a suitable 0.45-µm filter, discarding the first few mL.

Mobile phase: Water, acetonitrile, and phosphoric acid (760:240:1)

Chromatographic system(See *Chromatography* ⟨621⟩, *System Suitability*.)**Mode:** LC**Detector:** UV 203 nm**Column:** 4.6-mm × 7.5-cm; 3.5-μm packing L7**Column temperature:** 40°**Flow rate:** 1.5 mL/min**Injection size:** 100 μL**System suitability****Sample:** *Standard solution***Suitability requirements****Tailing factor:** NMT 2.0**Relative standard deviation:** NMT 3.0%**Analysis****Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of oxybutynin chloride dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

 r_U = peak response from the *Sample solution* r_S = peak response from the *Standard solution* C_S = concentration of oxybutynin chloride in the *Standard solution* L = Tablet label claim (mg) V = volume of *Medium* (mL), 900**Tolerances:** NLT 80% (Q) of the labeled amount of oxybutynin chloride is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** ⟨11⟩
USP Oxybutynin Chloride RS

Oxybutynin Chloride Extended-Release Tablets

DEFINITIONOxybutynin Chloride Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of oxybutynin chloride ($C_{22}H_{31}NO_3 \cdot HCl$).**IDENTIFICATION**

- **A. INFRARED ABSORPTION** ⟨197⟩

Standard: Dissolve 15 mg of USP Oxybutynin Chloride RS in 5 mL of water. Adjust with 0.1 N sodium hydroxide to a pH of between 7 and 8. Extract the solution twice with 10 mL of ether. Combine the extracts, evaporate the ether, and dry under vacuum over silica gel for at least 30 min. Redissolve the dried residue in a small amount of acetone, transfer the solution to an IR salt plate, and evaporate to cast a thin film.

Sample: Add a quantity of finely powdered Tablets, equivalent to about 15 mg of oxybutynin chloride, to 5 mL of water per Tablet. Mix for 1 min. Adjust with 0.1 N sodium hydroxide to a pH between 7 and 8. Extract the solution twice with 10 mL of ether. Combine the extracts, evaporate the ether, and dry under vacuum over silica gel for at least 30 min. Redissolve the dried residue in a small amount of acetone, transfer the solution to an IR salt plate, and evaporate to cast a thin film.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **PROCEDURE****Diluent:** Use water adjusted with phosphoric acid to a pH of 3.5.**Solution A:** Methanol and acetonitrile (1:1)**Mobile phase:** Acetonitrile, triethylamine, and water (700:3:1300). Adjust with phosphoric acid to a pH of 3.9.**Impurity stock solution:** 0.11 mg/mL of USP Oxybutynin Related Compound A RS in acetonitrile**Standard stock solution:** 0.37 mg/mL of USP Oxybutynin Chloride RS in acetonitrile**System suitability solution:** Transfer 10 mL of the *Standard stock solution* and 1 mL of the *Impurity stock solution* to a 100-mL volumetric flask, and dilute with *Diluent* to volume.**Standard solution:** 0.1 mg/mL in *Diluent* from the *Standard stock solution***Sample solution**

For Tablets that contain 5 mg of oxybutynin chloride: Place 10 Tablets in a 500-mL volumetric flask, add 150 mL of *Solution A*, and stir for at least 4 h or until dissolved. Dilute with *Diluent* to volume. Mix thoroughly, centrifuge, and use the clear supernatant.

For Tablets that contain 10 mg or more of oxybutynin chloride: Place 10 Tablets in a 1000-mL volumetric flask, add 300 mL of *Solution A*, and stir for at least 4 h or until dissolved. Dilute with *Diluent* to volume. If necessary, make a further dilution with *Diluent* to obtain a solution having a final concentration equivalent to 0.1 mg/mL of oxybutynin chloride. Mix thoroughly, centrifuge, and use the clear supernatant.

Chromatographic system(See *Chromatography* ⟨621⟩, *System Suitability*.)**Mode:** LC**Detector:** UV 220 nm**Column:** 4.6-mm × 15-cm; packing L11**Flow rate:** 1.5 mL/min**Injection size:** 50 μL**System suitability****Sample:** *System suitability solution*

[NOTE—The relative retention times for oxybutynin and oxybutynin related compound A are about 1.0 and 1.6, respectively.]

Suitability requirements**Resolution:** NLT 1.5 between oxybutynin and oxybutynin related compound A**Tailing factor:** Greater than 0.75 and NMT 2.5 for each peak**Relative standard deviation:** NMT 3% for each compound for six replicate injections**Analysis****Samples:** *Standard solution* and *Sample solution*Calculate the percentage of the labeled amount of oxybutynin chloride ($C_{22}H_{31}NO_3 \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 r_U = peak response from the *Sample solution* r_S = peak response from the *Standard solution* C_S = concentration of USP Oxybutynin Chloride RS in the *Standard solution* (mg/mL) C_U = nominal concentration of oxybutynin chloride in the *Sample solution* (mg/mL)**Acceptance criteria:** 90.0%–110.0%**PERFORMANCE TESTS**

- **DISSOLUTION** ⟨711⟩

Test 1**Medium:** Simulated gastric fluid without enzyme; 50 mL**Apparatus 7:** See *Drug Release* ⟨724⟩, 30 cycles/min; 2- to 3-cm amplitude, at $37.0 \pm 0.5^\circ$

Times: 4, 10, and 24 h

Solution A: 4.83 g/L of monobasic sodium phosphate in water. Add 2.3 mL/L of triethylamine, and adjust with phosphoric acid to a pH of 2.2 ± 0.2 .

Mobile phase: Acetonitrile and *Solution A* (7:13)

Solution B: To 1 L of water add phosphoric acid dropwise to a pH of 3.5, and mix well.

Standard stock solutions: 250, 300, and 350 µg/mL

each of USP Oxybutynin Chloride RS in acetonitrile
Standard solutions: Prepare a series of dilutions of the *Standard stock solutions* in *Solution B* having final concentrations similar to those expected in the *Sample solution*.

System suitability solution: Use a medium range *Standard solution* of USP Oxybutynin Chloride RS.

Sample solution: Use portions of the solution under test. If the solution is cloudy, centrifuge at 2000 rpm for 10 min, and use the supernatant.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm × 5-cm; packing L11

Column temperature: 35°

Flow rate: 1.5 mL/min

Injection size: 50 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Tailing factor: Greater than 0.5 and less than 2.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solutions* and *Sample solution*

Construct a calibration curve by plotting the peak response versus concentration of the *Standard solutions*. A weighing factor, $1/x$, is applied to the regression line of the calibration curve to enhance the accuracy of the low standard concentrations. Determine the percentage of oxybutynin chloride ($C_{22}H_{31}NO_3 \cdot HCl$) dissolved in each interval from a linear regression analysis of the calibration curve.

Tolerances: See *Tables 1* and *2*.

Table 1. For Tablets labeled to contain 5 or 10 mg of oxybutynin chloride

Time (h)	Amount Dissolved
4	NMT 20%
10	34.5%–59.5%
24	NLT 80%

Table 2. For Tablets labeled to contain 15 mg of oxybutynin chloride

Time (h)	Amount Dissolved
4	NMT 20%
10	34.5%–59.5%
24	NLT 75%

The percentages of the labeled amount of oxybutynin chloride ($C_{22}H_{31}NO_3 \cdot HCl$) dissolved at the times specified conform to *Acceptance Table 2* in *Dissolution* <711>.

Test 2: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

Acid stage medium: Simulated gastric fluid, without enzymes, pH 1.2 ± 0.05 ; 250 mL (first row)

Buffer stage medium: Simulated intestinal fluid, without enzymes, pH 6.8 ± 0.1 ; 250 mL (rows 2–4)

Apparatus 3: 25 dips/min; 20-mesh polypropylene screen on top and bottom; 30 s drip time

Times: 2 h in the *Acid stage medium* (first row); 4, 8, and 16 h (corresponding to 2, 6, and 14 h after changing the medium) in the *Buffer stage medium* (rows 2–4)

Solution A: Transfer 1 mL of triethylamine to 1000 mL of water. Adjust with phosphoric acid to a pH of 3.50 ± 0.05 .

Mobile phase: Acetonitrile and *Solution A* (4:1)

Standard stock solution: 0.2 mg/mL of USP Oxybutynin Chloride RS in *Acid stage medium*

Working standard solution: Transfer 5.0 mL of the *Standard stock solution* for Tablets labeled to contain 5 mg, transfer 10 mL for Tablets labeled to contain 10 mg, or transfer 15 mL for Tablets labeled to contain 15 mg to a 100-mL volumetric flask. Dilute with *Buffer stage medium* to volume.

Sample solution: Centrifuge a portion of the solution under test at approximately 3000 rpm for 10 min. Use the supernatant.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 203 nm

Column: 4.6-mm × 25-cm; packing L7

Flow rate: 1.5 mL/min

Injection size: 25 µL

System suitability

Sample: *Working standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Working standard solution* and *Sample solution*

Calculate the percentage of oxybutynin chloride ($C_{22}H_{31}NO_3 \cdot HCl$) dissolved at each time point (C_{T2} , C_{T4} , C_{T8} , C_{T16}):

$$C_i = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Working standard solution*

C_S = concentration of the *Working standard solution* (mg/mL)

L = label claim (mg/Tablet)

V = volume of *Medium*, 250 mL

C_{T2} = percentage dissolved at 2 h, C_2

C_{T4} = percentage dissolved at 4 h, $C_2 + C_4$

C_{T8} = percentage dissolved at 8 h, $C_2 + C_4 + C_8$

C_{T16} = percentage dissolved at 16 h, $C_2 + C_4 + C_8 + C_{16}$

Tolerances: See *Tables 3* and *4*.

Table 3. For Tablets labeled to contain 5 or 10 mg

Time (h)	Amount Dissolved
2	0%–10%
4	10%–30%
8	40%–65%
16	NLT 80%

Table 4. For Tablets labeled to contain 15 mg

Time (h)	Amount Dissolved
2	0%–10%
4	10%–30%
8	35%–65%
16	NLT 75%

The percentages of the labeled amount of oxybutynin chloride ($C_{22}H_{31}NO_3 \cdot HCl$) dissolved at the times specified conform to *Acceptance Table 2* in *Dissolution* (711).

Test 3: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution* Test 3.

Medium: Simulated gastric fluid without enzyme; 50 mL

Apparatus 7: See *Drug Release* (724). Use acrylic rods. 30 dips/min, $37.0 \pm 0.5^\circ$, 10 s drip time. Dip time interval: row 1, 1 h; row 2, 3 h; row 3, 6 h; row 4, 5 h; row 5, 9 h.

Times: 4, 10, and 24 h

pH 2.3 phosphate buffer: 3.4 mg/mL of monobasic potassium phosphate in water. Adjust with phosphoric acid or 2 N potassium hydroxide to a pH of 2.30 ± 0.05 .

Standard solution: ($L/200$) mg/mL of USP Oxybutynin Chloride RS in *Medium*, where L is the Tablet label claim, in mg

Sample solution: Pass a portion of the solution under test through a suitable nylon filter of 0.45- μ m pore size, discarding the first few mL.

Mobile phase: pH 2.3 phosphate buffer and acetonitrile (7:3)

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm \times 15-cm; packing L10

Flow rate: 1.0 mL/min

Injection size: 10 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the amount, in mg, of oxybutynin chloride ($C_{22}H_{31}NO_3 \cdot HCl$) dissolved at each time interval:

$$\text{Result} = (r_u/r_s) \times (C_s/L) \times V$$

r_u = peak response from the *Sample solution*

r_s = peak response from the *Standard solution*

C_s = concentration of the *Standard solution* (mg/mL)

L = label claim (mg/Tablet)

V = volume of *Medium*, 50 mL

Calculate the percentage of oxybutynin dissolved:

$$\text{Result} = \Sigma(\text{amount dissolved at current time interval} + \text{amount dissolved at previous time intervals}) \times 100/L$$

Tolerances: See *Table 5*.

Table 5

Time (h)	Amount Dissolved
4	NMT 25%
10	40%–65%
24	NLT 75%

The percentages of the labeled amount of oxybutynin chloride ($C_{22}H_{31}NO_3 \cdot HCl$) dissolved at the times specified conform to *Acceptance Table 2* in *Dissolution* (711).

Test 4: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution* Test 4.

Acid stage medium: 0.1 N hydrochloric acid; 900 mL

Buffer stage medium: pH 6.0 sodium phosphate buffer with 0.2% of sodium lauryl sulfate; 900 mL

Apparatus 2: 50 rpm, with sinkers. [NOTE—A suitable sinker is available as catalog number CAPWHT-2S from www.QLA-LLC.com.]

Times: 2 h in the *Acid stage medium*; 4, 6, and 14 h (corresponding to 2, 4, 12 h after changing the medium) in the *Buffer stage medium*

Standard solution: ($L/1000$) mg/mL of USP Oxybutynin Chloride RS in *Buffer stage medium*, where L is the Tablet label claim, in mg

Sample solution: Pass a portion of the solution under test through a suitable PVDF filter of 0.45- μ m pore size.

pH 3.5 phosphate buffer: 6.94 mg/mL of monobasic potassium phosphate in water. Adjust with diluted phosphoric acid to a pH of 3.50 ± 0.05 .

Mobile phase: pH 3.5 phosphate buffer and acetonitrile (1:1)

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm \times 15-cm; packing L7

Flow rate: 1.0 mL/min

Injection size: 20 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 2000 theoretical plates

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the concentration (mg/mL) of oxybutynin chloride ($C_{22}H_{31}NO_3 \cdot HCl$) (C_i) at each time point:

$$C_i = (r_u/r_s) \times C_s$$

r_u = peak response from the *Sample solution*

r_s = peak response from the *Standard solution*

C_s = concentration of the *Standard solution* (mg/mL)

Calculate the cumulative percentage of oxybutynin chloride ($C_{22}H_{31}NO_3 \cdot HCl$) dissolved (Q_i) at each time point (i):

At $i = 1$

$$Q_1 = (C_1 \times V/L) \times 100$$

At $i = 2$ to n

$$\frac{(C_1 \times 900) + \sum_{j=2}^{n-1} C_j V_s + C_n \times [900 - (n-2)V_s] \times 100}{L}$$

$i = 1, 2, \dots, n$

$j = 2, 3, \dots, n-1$

V_s = sampling volume (mL)

C_i = concentration of oxybutynin chloride in the *Sample solution* at time point i (mg/mL)

C_j = concentration of oxybutynin chloride in the *Sample solution* at time point 2 through $n-1$ (mg/mL)

L = label claim (mg/Tablet)

Tolerances: See *Table 6*.

Table 6

Time (h)	Amount Dissolved
2	NMT 10%
4	10%–40%

Table 6 (Continued)

Time (h)	Amount Dissolved
6	40%–75%
14	NLT 85%

The percentages of the labeled amount of oxybutynin chloride ($C_{22}H_{31}NO_3 \cdot HCl$) dissolved at the times specified conform to Acceptance Table 2 in Dissolution (711).

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

Diluent, Solution A, Mobile phase, Impurity stock solution, System suitability solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the Assay.

Impurity standard solution: 1 µg/mL of USP Oxybutynin Related Compound A RS in Diluent from the Impurity stock solution

Analysis

Samples: Impurity standard solution and Sample solution

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response for each impurity from the Sample solution

r_S = peak response from the Impurity standard solution

C_S = concentration of USP Oxybutynin Related Compound A RS in the Standard solution (mg/mL)

C_U = concentration of the Sample solution (mg/mL)
[NOTE—Disregard any peak less than 0.1%.]

Acceptance criteria

Individual impurities: NMT 1% of oxybutynin related compound A is found.

Total impurities: NMT 2%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature.
- **LABELING:** When more than one Dissolution test is given, the labeling states the Dissolution test used only if Test 1 is not used.
- **USP REFERENCE STANDARDS (11)**

Oxycodone Hydrochloride

$C_{18}H_{21}NO_4 \cdot HCl$ 351.82
Morphinan-6-one, 4,5-epoxy-14-hydroxy-3-methoxy-17-methyl-, hydrochloride, (5α)-;
4,5α-Epoxy-14-hydroxy-3-methoxy-17-methylmorphinan-6-one hydrochloride [124-90-3].

DEFINITION

Oxycodone Hydrochloride contains NLT 97.0% and NMT 103.0% of oxycodone hydrochloride ($C_{18}H_{21}NO_4 \cdot HCl$), calculated on the anhydrous, solvent-free basis.

IDENTIFICATION

• A. PROCEDURE

Sample solution: Dissolve 250 mg in 25 mL of water.

Analysis: Render the 25 mL of Sample solution alkaline with 6 N ammonium hydroxide. Allow the mixture to stand until a precipitate is formed. Filter, wash the precipitate with 50 mL of cold water, and dry at 105° for 2 h.

Acceptance criteria: The precipitate melts between 218° and 223°, but the range between the beginning and the end of melting does not exceed 2° (see Melting Range or Temperature (741)).

- **B. INFRARED ABSORPTION (197K):** Use a portion of the dried precipitate obtained in Identification test A.
- **C.** The retention time of the oxycodone peak of the Sample solution corresponds to that of the Standard solution, as obtained in the Assay.

ASSAY

• PROCEDURE

Mobile phase: 0.005 M sodium 1-hexanesulfonate, methanol, triethylamine, and phosphoric acid (900:100:2:5). Adjust with 50% sodium hydroxide solution to a pH of 2.5 ± 0.1 and filter.

System suitability solution: 13 µg/mL of codeine phosphate and 9 µg/mL of oxycodone in Mobile phase

Standard solution: 0.9 mg/mL of USP Oxycodone RS in Mobile phase

Sample solution: 1 mg/mL of Oxycodone Hydrochloride in Mobile phase. [NOTE—Pass a portion of this solution through a filter of 0.5-µm or finer pore size, and use the filtrate as the Sample solution.]

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 206 nm

Column: 3.9-mm × 15-cm; 4-µm packing L7

Column temperature: 50°

Flow rate: 1.5 mL/min

Injection volume: 10 µL

Run time: NLT 2 times the retention time of oxycodone

System suitability

Samples: System suitability solution and Standard solution

[NOTE—The relative retention times for codeine and oxycodone are about 0.8 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 3.0 between codeine and oxycodone, System suitability solution

Tailing factor: 0.75–1.25, Standard solution

Relative standard deviation: NMT 2.0% from replicate injections, Standard solution

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of oxycodone hydrochloride ($C_{18}H_{21}NO_4 \cdot HCl$) in the portion of Oxycodone Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the Sample solution

r_S = peak response from the Standard solution

C_S = concentration of USP Oxycodone RS in the Standard solution (mg/mL)

C_U = concentration of Oxycodone Hydrochloride in the Sample solution (mg/mL)

M_{r1} = molecular weight of oxycodone hydrochloride, 351.82

M_{r2} = molecular weight of oxycodone base, 315.37

Acceptance criteria: 97.0%–103.0% on the anhydrous, solvent-free basis

IMPURITIES

- **RESIDUE ON IGNITION (281):** NMT 0.05%. [NOTE—Use of sulfuric acid is omitted.]

- **LIMIT OF ALCOHOL**

Internal standard stock solution: Transfer 6.0 mL of isopropyl alcohol to a 500-mL volumetric flask, and dilute with water to volume. [NOTE—The isopropyl alcohol must be free of alcohol impurities.]

Internal standard solution: Transfer 5.0 mL of the *Internal standard stock solution* to a 100-mL volumetric flask, and dilute with water to volume.

Standard stock solution: 16 mg/mL of alcohol (C_2H_5OH) in water

Standard solution: Pipet 3.0 mL of the *Standard stock solution* and 5.0 mL of the *Internal standard stock solution* into a 100-mL volumetric flask, and dilute with water to volume.

Sample solution: Transfer about 240 mg of Oxycodone Hydrochloride to a 15-mL centrifuge tube, add 5.0 mL of the *Internal standard solution*, and mix to dissolve.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 4-mm \times 1.8-m glass; packed with 80- to 100-mesh support S3

Carrier gas: Helium

Temperatures

Injection port: 170°

Column: 150°. [NOTE—Condition the column overnight at 235° with a slow flow of carrier gas.]

Detector: 170°

Injection volume: 5 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 2 between isopropyl alcohol and alcohol

Tailing factor: NMT 1.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of alcohol (C_2H_5OH) in the portion of Oxycodone Hydrochloride taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of the alcohol peak to the isopropyl alcohol from the *Sample solution*

R_S = peak response ratio of the alcohol peak to the isopropyl alcohol from the *Standard solution*

C_S = concentration of alcohol in the *Standard solution* (mg/mL)

C_U = concentration of Oxycodone Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 1.0%

- **ORGANIC IMPURITIES**

[NOTE—On the basis of the synthetic route, perform either (a) *Procedure 1* and *Procedure 2* or (b) *Procedure 3*. *Procedure 1* and *Procedure 2* are recommended if 8 β -hydroxyoxycodone (7,8-dihydro-8 β -14-dihydroxycodone) is a potential impurity.]

Procedure 1

Analysis: Use the chromatogram of the *Sample solution* from the *Assay* to calculate the percentage of each impurity in the portion of Oxycodone Hydrochloride taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response for each impurity

r_T = sum of the responses of all the peaks

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Oxymorphone	0.31	0.15
Noroxymorphone ^a	0.33	0.15
10-Hydroxyoxycodone ^b	0.53	0.15
6- α -Oxycodol ^c	0.67	0.25
8 β -Hydroxyoxycodone (7,8-dihydro-8 β -14-dihydroxycodone) ^d	0.71	0.15
Hydrocodone	1.19	0.15
Individual unspecified impurity	—	0.10
Total impurities	—	2.0

^a 4,5 α -Epoxy-3,14-dihydroxymorphinan-6-one.

^b 4,5 α -Epoxy-10 α ,14-dihydroxy-3-methoxy-17-methylmorphinan-6-one.

^c 4,5 α -Epoxy-3-methoxy-17-methylmorphinan-6 α ,14-diol.

^d 4,5 α -Epoxy-8 β ,14-dihydroxy-3-methoxy-17-methylmorphinan-6-one.

Procedure 2: Limit of Oxycodone Related Compound A (14-Hydroxycodone) and Oxycodone Related Compound C (Codeinone)

Solution A: Dissolve 3.45 g of monobasic sodium phosphate in 1000 mL of water. Add 5.41 g of sodium dodecyl sulfate and mix. Filter and adjust with 50% (w/v) sodium hydroxide solution to a pH of 7.50 \pm 0.05.

Solution B: Water and phosphoric acid (9:1)

Mobile phase: Prepare a mixture of acetonitrile, methanol, and *Solution A* (15.8: 12.0: 72.2), and adjust with *Solution B* to a pH of 7.80 \pm 0.01.

Diluent: Prepare a mixture of water and *Solution B* (9:1).

Unspiked oxycodone hydrochloride solution: 50 mg/mL of USP Oxycodone Hydrochloride RS in *Diluent*

System suitability solution: 100 μ g/mL of USP Oxycodone Hydrochloride RS and 5 μ g/mL each of USP Oxycodone Related Compound A RS and USP Oxycodone Related Compound C RS in *Diluent*

Standard solution: 50 mg/mL of USP Oxycodone Hydrochloride RS and 0.5 μ g/mL each of USP Oxycodone Related Compound A RS and USP Oxycodone Related Compound C RS in *Diluent*

Sample solution: 50 mg/mL of Oxycodone Hydrochloride in *Diluent*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 3.0-mm \times 15-cm; 3.5- μ m packing L1

Column temperature: 40°

Flow rate: 0.7 mL/min

Injection volume: 5 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for oxycodone related compound C, oxycodone related compound A, and oxycodone are about 0.44, about 0.85, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 4 between oxycodone related compound A and oxycodone related compound C, *System suitability solution*

Tailing factor: NMT 2.0, *System suitability solution*

Relative standard deviation: NMT 20% for oxycodone related compound A and oxycodone related compound C, *Standard solution*

Analysis

Samples: *Diluent*, *Unspiked oxycodone hydrochloride solution*, *Standard solution*, and *Sample solution*

Calculate the percentage of oxycodone related compound A and oxycodone related compound C in the portion of Oxycodone Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of oxycodone related compound A or oxycodone related compound C from the *Sample solution*

r_S = peak response of oxycodone related compound A or oxycodone related compound C minus the response of the *Unspiked oxycodone hydrochloride solution* from the *Standard solution*

C_S = concentration of USP Oxycodone Related Compound A RS or USP Oxycodone Related Compound C RS in the *Standard solution* (mg/mL)

C_U = concentration of Oxycodone Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: See Table 2.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Oxycodone related compound C ^a	0.44	0.001
Oxycodone related compound A ^b	0.85	0.001
Oxycodone	1.0	—

^a Codeinone (C₁₈H₁₉NO₃).

^b 14-Hydroxycodeinone (C₁₈H₂₁NO₄).

(Procedure 2 postponed indefinitely)

Procedure 3

Buffer: Mix 4.0 mL of heptafluorobutyric acid with 2000 mL of water and adjust with ammonium hydroxide to a pH of 2.3 ± 0.1.

Solution A: Methanol and Buffer (23:77)

Solution B: Methanol, tetrahydrofuran, and Buffer (20:3:77)

Mobile phase: See Table 3.

Table 3

Time (min)	Solution A (%)	Solution B (%)
0	100	0
2	100	0
30	0	100
55	0	100
55.1	100	0
65	100	0

Diluent: Mix 3.0 mL of trifluoroacetic acid with 1000 mL of water.

System suitability solution: 0.0067 mg/mL each of USP Hydrocodone RS and USP Oxycodone Related Compound A RS, and 3.0 mg/mL of USP Oxycodone Hydrochloride RS in *Diluent*

Standard solution: 0.0067 mg/mL of USP Hydrocodone RS in *Diluent*

Sample solution: 3.0 mg/mL of Oxycodone Hydrochloride in *Diluent*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 25-cm; 3-μm packing L1

Column temperature: 38°

Flow rate: 0.8 mL/min

Injection volume: 50 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between oxycodone and hydrocodone; NLT 1.0 between hydrocodone and oxycodone related compound A, *System suitability solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Oxycodone Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times (1/F) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of hydrocodone from the *Standard solution*

C_S = concentration of USP Hydrocodone RS in the *Standard solution* (mg/mL)

C_U = concentration of Oxycodone Hydrochloride in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of hydrocodone hydrochloride, 335.83

M_{r2} = molecular weight of hydrocodone, 299.36

F = relative response factor (see Table 4)

Acceptance criteria: See Table 4. Disregard any peaks below 0.03%.

Table 4

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Oxymorphone hydrochloride	0.54	0.93	0.15
1-Hydroxyoxycodone hydrochloride ^a	0.69	1.00	0.15
6-Oxycodol hydrochloride ^b	0.79	1.16	0.25
Oxycodone hydrochloride	1.00	—	—
Hydrocodone hydrochloride	1.14	1.00	0.50

Noroxycodone hydrochloride ^d	1.26	0.94	0.50

^a 4,5α-Epoxy-1,14-dihydroxy-3-methoxy-17-methylmorphinan-6-one hydrochloride.

^b 4,5α-Epoxy-3-methoxy-17-methylmorphinan-6,14-diol hydrochloride.

^c 4,5α-Epoxy-14-hydroxy-3-methoxy-17-methylmorphinan-7-ene-6-one (oxycodone related compound A hydrochloride salt).

^d 4,5α-Epoxy-3-methoxy-17-methylmorphinan-6-one hydrochloride.

Table 4 (Continued)

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Individual unspecified impurity	—	—	0.10
Total impurities	—	—	1.5

^a 4,5 α -Epoxy-1,14-dihydroxy-3-methoxy-17-methylmorphinan-6-one hydrochloride.

^b 4,5 α -Epoxy-3-methoxy-17-methylmorphinan-6,14-diol hydrochloride.

^c 4,5 α -Epoxy-14-hydroxy-3-methoxy-17-methylmorphinan-7-ene-6-one (oxycodone related compound A hydrochloride salt).

^d 4,5 α -Epoxy-3-methoxy-17-methylmorphinan-6-one hydrochloride.

SPECIFIC TESTS

• CONTENT OF CHLORIDE

Sample solution: 6 mg/mL in methanol

Analysis: To 50 mL of the *Sample solution*, add 5 mL of glacial acetic acid and titrate with 0.1 N silver nitrate VS, determining the endpoint potentiometrically. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of chloride.

Acceptance criteria: 9.8%–10.4% on the anhydrous, solvent-free basis

• OPTICAL ROTATION (7815), *Specific Rotation*

Sample solution: 25 mg/mL of Oxycodone Hydrochloride in water on the anhydrous, solvent-free basis

Acceptance criteria: -137° to -149°

• WATER DETERMINATION (921), *Method I*: NMT 7.0%

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE: Preserve in tight containers.

• LABELING: The label states with which *Organic Impurities* procedure the article complies if *Organic Impurities, Procedure 1* is not used.

• USP REFERENCE STANDARDS (11)

USP Hydrocodone RS

USP Oxycodone RS

USP Oxycodone Hydrochloride RS

USP Oxycodone Related Compound A RS

Also known as 14-Hydroxycodeinone;

4,5 α -Epoxy-14-hydroxy-3-methoxy-17-methylmorphinan-7-ene-6-one.

$C_{18}H_{19}NO_4$ 313.35

USP Oxycodone Related Compound C RS

4,5 α -Epoxy-3-methoxy-17-methylmorphinan-7-ene-6-one.

$C_{18}H_{19}NO_3$ 297.35

Oxycodone Hydrochloride Oral Solution

DEFINITION

Oxycodone Hydrochloride Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of oxycodone hydrochloride ($C_{18}H_{21}NO_4 \cdot HCl$).

IDENTIFICATION

• A.

Sample solution: Transfer an amount equivalent to 15 mg of oxycodone from Oral Solution to a separatory funnel, add 10 mL of 0.01 N hydrochloric acid, and extract with four 40-mL portions of chloroform, collecting the chloroform extracts in a second separator. Wash the combined chloroform extracts with 5 mL of 0.01 N hydrochloric acid, and discard the chloroform layer. Combine the acidic wash with the aqueous solution remaining in the first separator and adjust with 6 N ammonium hydroxide to a pH of 9.5 ± 0.5 . Extract with one 50-mL and two 20-mL portions of chloroform,

and filter the chloroform extracts through chloroform-washed cotton, collecting the filtrate in a 100-mL volumetric flask. Dilute with water-saturated chloroform to volume, and mix.

Standard solution: Prepare a solution using 12 mg of USP Oxycodone RS and 25 mL of 0.01 N hydrochloric acid, and proceed as directed above, beginning with "extract with four 40-mL portions of chloroform".

Acceptance criteria: The UV absorption spectrum of the *Sample solution* exhibits maxima and minima at the same wavelengths as that of the *Standard solution*, concomitantly measured.

• B. THIN-LAYER CHROMATOGRAPHY

Standard solution: Evaporate 5 mL of the *Standard solution* obtained from *Identification* test A just to dryness. Dissolve the residue in 1.0 mL of chloroform.

Sample solution: Evaporate 5 mL of the *Sample solution* obtained from *Identification* test A just to dryness. Dissolve the residue in 1.0 mL of chloroform.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 20 μ L

Developing solvent system: Acetone, toluene, ether, and ammonium hydroxide (6:4:1:0.3)

Analysis

Samples: *Standard solution* and *Sample solution*

Develop the plate until the solvent front has moved about three-fourths of the length of the plate, remove it, mark the solvent front, allow the solvent to evaporate, and spray with iodoplatinate TS.

Acceptance criteria: The principal spot from the *Sample solution* corresponds in color, size, and R_f value to that from the solution from the *Standard solution*, and no other spots are observed.

• C. The retention time of the oxycodone peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• PROCEDURE

Mobile phase: Acetonitrile, 0.01 M sodium 1-hexanesulfonate, and glacial acetic acid (25:74:1). Adjust with 5 N sodium hydroxide to a pH of 3.5.

Standard solution: 0.045 mg/mL of USP Oxycodone RS in *Mobile phase*

Sample solution: Transfer an amount equivalent to 5 mg of oxycodone hydrochloride from Oral Solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pass a portion of this mixture through a filter having a 0.5- μ m or finer pore size, and use the clear filtrate as the *Sample solution*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L1

Flow rate: 1.7 mL/min

Injection volume: 10 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of oxycodone hydrochloride ($C_{18}H_{21}NO_4 \cdot HCl$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

- r_U = peak response from the *Sample solution*
 r_S = peak response from the *Standard solution*
 C_S = concentration of USP Oxycodone RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of oxycodone hydrochloride in the *Sample solution* (mg/mL)
 M_{r1} = molecular weight of oxycodone hydrochloride, 351.82
 M_{r2} = molecular weight of oxycodone base, 315.37
 Acceptance criteria: 90.0%–110.0%

OTHER COMPONENTS

- **ALCOHOL DETERMINATION, Method II (611):** If present, 85.0%–115.0% of the labeled amount of alcohol (C_2H_5OH), determined by the gas-liquid chromatographic method, using acetone as the internal standard

PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS (905):** Meets the requirements for oral solution packaged in single-unit containers
- **DELIVERABLE VOLUME (698):** Meets the requirements for oral solution packaged in multiple-unit containers

SPECIFIC TESTS

- **pH (791):** 1.4–4.6

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS (11)**
USP Oxycodone RS

Oxycodone Hydrochloride Tablets

DEFINITION

Oxycodone Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of oxycodone hydrochloride ($C_{18}H_{21}NO_4 \cdot HCl$).

IDENTIFICATION

- **A.** The retention time of the oxycodone peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

PROCEDURE

Mobile phase: Acetonitrile, 0.01 M sodium 1-heptanesulfonate, and glacial acetic acid (25:74:1). Adjust this mixture with 5 N sodium hydroxide to a pH of 3.5.

Standard solution: 0.045 mg/mL of USP Oxycodone RS in *Mobile phase*

Sample solution: 0.05 mg/mL of oxycodone hydrochloride in *Mobile phase* from NLT 20 finely powdered Tablets. Initially add 50% of the volume of the flask of *Mobile phase*, sonicate for about 5 min, and shake by mechanical means for about 15 min. Dilute with *Mobile phase* to volume, and pass a portion of this mixture through a filter of 0.5- μ m or finer pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L1

Flow rate: 1.7 mL/min

Injection size: 10 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0 for the oxycodone peak

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of oxycodone hydrochloride ($C_{18}H_{21}NO_4 \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

- r_U = peak response from the *Sample solution*
 r_S = peak response from the *Standard solution*
 C_S = concentration of USP Oxycodone RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of oxycodone hydrochloride in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of oxycodone hydrochloride, 351.82

M_{r2} = molecular weight of the oxycodone base, 315.37

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

DISSOLUTION (711)

Medium: Water; 500 mL

Apparatus 2: 50 rpm

Time: 45 min

Standard solution: Prepare a known concentration of USP Oxycodone RS in 0.1 N hydrochloric acid.

Sample solution: Sample per *Dissolution* (711). Dilute with *Medium* as needed.

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: UV

Analytical wavelength: Maximum at about 225 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Tolerances: NLT 70% (Q) of the labeled amount of oxycodone hydrochloride ($C_{18}H_{21}NO_4 \cdot HCl$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS (11)**
USP Oxycodone RS

Oxycodone Hydrochloride Extended-Release Tablets

DEFINITION

Oxycodone Hydrochloride Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of oxycodone hydrochloride ($C_{18}H_{21}NO_4 \cdot HCl$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY• **PROCEDURE**

Buffer solution: 2 g/L of sodium heptanesulfonate in water. Add 13.3 mL/L of glacial acetic acid, and adjust with 5 N sodium hydroxide solution to a pH of 3.50 ± 0.05 .

Mobile phase: Acetonitrile and *Buffer solution* (1:3)

Standard solution: 0.036 mg/mL of USP Oxycodone RS in *Mobile phase*

Sample stock solution: Transfer 10 Tablets into an appropriate volumetric flask, and add a volume of a mixture of methanol and acetonitrile (1:1) equivalent to 50% of the volumetric flask volume. Sonicate for 10 min, and stir for 20 min. Dilute with *Buffer solution* to volume.

Sample solution: 0.04 mg/mL of oxycodone hydrochloride from the *Sample stock solution*, diluted with *Mobile phase* to volume. Pass through a suitable filter.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm \times 15-cm; packing L1

Flow rate: 1.0 mL/min

Injection volume: 20 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 4000 theoretical plates

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of oxycodone hydrochloride ($C_{18}H_{21}NO_4 \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Oxycodone RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of the *Sample solution* (mg/mL)

M_{r1} = molecular weight of oxycodone hydrochloride, 351.82

M_{r2} = molecular weight of oxycodone base, 315.37

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS• **DISSOLUTION (711)****Test 1**

Medium: Simulated gastric fluid (without enzymes); 900 mL

Apparatus 1: 100 rpm

Times: 1, 2, 4, 6, and 8 h for Tablets labeled to contain 10, 20, or 40 mg; 1, 2, 4, and 6 h for Tablets labeled to contain 80 mg

Standard stock solution

Tablets labeled to contain 10 mg: 398 μ g/mL of USP Oxycodone RS in *Medium*

Tablets labeled to contain 20, 40, or 80 mg: 796 μ g/mL of USP Oxycodone RS in *Medium*

Standard solution: Dilute the appropriate *Standard stock solution* with *Medium* to obtain solutions containing (L/900) mg/mL, with L as the label claim in mg/ Tablet.

Sample solution: Pass a portion of the solution under test through a suitable filter. Dilute with *Medium*, if necessary.

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: UV

Analytical wavelength: About 226 nm (shoulder)

Cell

For Tablets labeled to contain 10, 20, or 40 mg: 1.0 cm

For Tablets labeled to contain 80 mg: 0.5 cm

Blank: *Medium*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the concentration (C_i) of oxycodone hydrochloride ($C_{18}H_{21}NO_4 \cdot HCl$) in the sample withdrawn from the vessel at each time point (i):

$$\text{Result}_i = (A_U/A_S) \times C_S \times D \times (M_{r1}/M_{r2})$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

D = dilution factor of the *Sample solution*

M_{r1} = molecular weight of oxycodone hydrochloride, 351.82

M_{r2} = molecular weight of oxycodone base, 315.37

For Tablets labeled to contain 10, 20, or 40 mg, calculate the labeled amount of oxycodone hydrochloride ($C_{18}H_{21}NO_4 \cdot HCl$) released at each time point (i):

$$\text{Result}_1 = C_i \times V \times (1/L) \times 100$$

$$\text{Result}_2 = \{[C_2 \times (V - V_3)] + (C_i \times V_3)\} \times (1/L) \times 100$$

$$\text{Result}_3 = \{[C_3 \times [V - (2 \times V_3)]] + [(C_2 + C_i) \times V_3]\} \times (1/L) \times 100$$

$$\text{Result}_4 = \{[C_4 \times [V - (3 \times V_3)]] + [(C_3 + C_2 + C_i) \times V_3]\} \times (1/L) \times 100$$

$$\text{Result}_5 = \{[C_5 \times [V - (4 \times V_3)]] + [(C_4 + C_3 + C_2 + C_i) \times V_3]\} \times (1/L) \times 100$$

C_i = concentration of oxycodone hydrochloride in the portion of sample withdrawn at time point i (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

V_3 = volume of the *Sample solution* withdrawn from the *Medium* (mL)

For Tablets labeled to contain 80 mg, calculate the labeled amount of oxycodone hydrochloride ($C_{18}H_{21}NO_4 \cdot HCl$) released at each time point (i):

$$\text{Result}_1 = C_i \times V \times (1/L) \times 100$$

$$\text{Result}_2 = \{[C_2 \times (V - V_3)] + (C_i \times V_3)\} \times (1/L) \times 100$$

$$\text{Result}_3 = \{[C_3 \times [V - (2 \times V_3)]] + [(C_2 + C_i) \times V_3]\} \times (1/L) \times 100$$

$$\text{Result}_4 = \{[C_4 \times [V - (3 \times V_3)]] + [(C_3 + C_2 + C_i) \times V_3]\} \times (1/L) \times 100$$

C_i = concentration of oxycodone hydrochloride in the portion of sample withdrawn at time point i (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

V_s = volume of the *Sample solution* withdrawn from the *Medium* (mL)

Tolerances: See *Table 1* for Tablets labeled to contain 10, 20, or 40 mg; see *Table 2* for Tablets labeled to contain 80 mg.

Table 1

Time Point (i)	Time (h)	Amount Released (%)
1	1	20–40
2	2	35–55
3	4	55–75
4	6	70–90
5	8	NLT 80

Table 2

Time Point (i)	Time (h)	Amount Released (%)
1	1	25–45
2	2	45–65
3	4	65–85
4	6	NLT 80

The percentages of the labeled amount of oxycodone hydrochloride ($C_{18}H_{21}NO_4 \cdot HCl$), released at the times specified, conform to *Acceptance Table 2* in *Dissolution* (711).

Test 2: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution* Test 2.

Medium: Simulated gastric fluid (without enzymes); 900 mL

Apparatus 1: 100 rpm

Times: 1, 4, and 12 h

0.85% Phosphoric acid: 10 mL/L of phosphoric acid in water

Mobile phase: Weigh 23.1 g of monobasic potassium phosphate into a 4-L flask, and dissolve with 3400 mL of water. Add 4 mL of triethylamine, and adjust with 0.85% Phosphoric acid to a pH of 3.0 ± 0.1 . Add 600 mL of methanol and 20 mL of *tert*-butyl methyl ether, and mix well.

Standard stock solution: 0.9 mg/mL of USP Oxycodone RS in 0.85% Phosphoric acid

Standard solution: Dilute the *Standard stock solution*, quantitatively and stepwise, with *Medium* to obtain a solution having a concentration of 40% of the Tablet label claim. [NOTE—This solution is stable for two weeks at room temperature.]

Sample solution: Pass the solution under test through a suitable filter of 0.45- μ m pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 3.9-mm \times 30-cm; 10- μ m packing L1

Column temperature: 60°

Flow rate: 1 mL/min

Injection volume: 50 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Capacity factor: NLT 0.5

Tailing factor: 0.75–1.5

Relative standard deviation: NMT 2%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the concentration (C_i) of oxycodone hydrochloride ($C_{18}H_{21}NO_4 \cdot HCl$) in the sample withdrawn from the vessel at each time point (i):

$$\text{Result}_i = (r_U/r_S) \times C_S \times (M_{r1}/M_{r2})$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

M_{r1} = molecular weight of oxycodone hydrochloride, 351.82

M_{r2} = molecular weight of oxycodone base, 315.37

Calculate the labeled amount of oxycodone hydrochloride ($C_{18}H_{21}NO_4 \cdot HCl$) released at each time point (i):

$$\text{Result}_1 = C_i \times V \times (1/L) \times 100$$

$$\text{Result}_2 = \{[C_2 \times (V - V_s)] + (C_i \times V_s)\} \times (1/L) \times 100$$

$$\text{Result}_3 = \{[C_3 \times [V - (2 \times V_s)]] + [(C_2 + C_i) \times V_s]\} \times (1/L) \times 100$$

C_i = concentration of oxycodone hydrochloride in the portion of sample withdrawn at time point i (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

V_s = volume of the *Sample solution* withdrawn from the *Medium* (mL)

Tolerances: See *Table 3* for Tablets labeled to contain 10 mg; see *Table 4* for Tablets labeled to contain 20 mg; see *Table 5* for Tablets labeled to contain 40 mg; see *Table 6* for Tablets labeled to contain 80 mg.

Table 3

Time Point (i)	Time (h)	Amount Released (%)
1	1	29–49
2	4	58–78

Oxycodone and Acetaminophen Capsules

DEFINITION

Oxycodone and Acetaminophen Capsules contain Oxycodone Hydrochloride and Acetaminophen, or Oxycodone Hydrochloride, Oxycodone Terephthalate, and Acetaminophen. Capsules contain NLT 90.0% and NMT 110.0% of the labeled amounts of oxycodone hydrochloride or oxycodone hydrochloride and oxycodone terephthalate, calculated as total oxycodone ($C_{18}H_{21}NO_4$), and NLT 90.0% and NMT 110.0% of the labeled amount of acetaminophen ($C_8H_9NO_2$).

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHY**

Standard solution A: 0.5 mg/mL of USP Oxycodone RS in a mixture of methanol and water (4:1)

Standard solution B: 0.5/ mg/mL of USP Acetaminophen RS in a mixture of methanol and water (4:1).

[NOTE— r is the ratio of the labeled amount, in mg, of acetaminophen to the labeled amount, in mg, of oxycodone per Capsule.]

Sample solution: Nominally equivalent to 0.5 mg/mL of oxycodone from Capsules in a mixture of methanol and water (4:1). Sonicate for 5 min, and shake by mechanical means for 15 min. Allow to settle, and use the clear supernatant.

Chromatographic system

(See Chromatography (621), Thin-Layer Chromatography.)

Mode: TLC

Adsorbent: 0.25-mm layer of silica gel mixture

Application volume: 20 μ L

Developing solvent system: Butyl alcohol, glacial acetic acid, and water (4:1:2)

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Proceed as directed in the chapter. Develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Mark the solvent front, and allow the plate to air-dry for about 30 min. Expose the plate to iodine vapors in a closed chamber, and locate the spots.

Acceptance criteria: The R_f values of the principal spots from the *Sample solution* correspond to those from the respective *Standard solutions*.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY**• PROCEDURE**

Solution A: Methanol and 0.05 M dibasic potassium phosphate (1:9). Adjust with phosphoric acid to a pH of 4.0.

Buffer: 0.95 mg/mL of monobasic potassium phosphate in water, phosphoric acid, and *n*-nonylamine (1000:1:1). Prepare as follows: Add 950 mg of monobasic potassium phosphate to 1000 mL of water. Add 1 mL of phosphoric acid, and stir until dissolved. While stirring, add 1 mL of *n*-nonylamine, and stir until a clear solution is obtained. Adjust with potassium hydroxide TS to a pH of 4.9 ± 0.1 .

Mobile phase: Methanol and Buffer (1:9)

Oxycodone standard stock solution: 0.075 mg/mL of USP Oxycodone RS in Solution A

Standard stock solution: 0.03/ mg/mL of USP Acetaminophen RS and 0.03 mg/mL of USP Oxycodone RS in Solution A. Prepare by adding 40% of the flask volume of Solution A to the appropriate quantity of USP Acetaminophen RS, and then adding 40% of the flask volume of Oxycodone standard stock solution and diluting with Solution A to volume. [NOTE—*J* is the ratio of the labeled amount of acetaminophen, in mg, to that of oxycodone equivalent.]

Standard solution: 0.003/ mg/mL of USP Acetaminophen RS and 0.003 mg/mL of USP Oxycodone RS in Mobile phase from Standard stock solution

Sample stock solution: Nominal equivalent of 0.03 mg/mL of oxycodone, from Capsules (NLT 20), in Solution A in a suitable container. Shake by mechanical means for 1 h.

Sample solution: 0.003 mg/mL of oxycodone in Mobile phase from Sample stock solution. Pass the resulting solution through a membrane filter of 0.5- μ m or finer pore size, discarding the first 10 mL of the filtrate.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 214 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Column temperature: 40°

Flow rate: 2 mL/min

Injection size: 20 μ L

System suitability

Sample: Standard solution

[NOTE—The relative retention times for oxycodone and acetaminophen are about 0.6 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.4 between acetaminophen and oxycodone

Relative standard deviation: NMT 2.0%

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of oxycodone ($C_{18}H_{21}NO_4$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of oxycodone from the Sample solution

r_S = peak response of oxycodone from the Standard solution

C_S = concentration of USP Oxycodone RS in the Standard solution (mg/mL)

C_U = nominal concentration of oxycodone in the Sample solution (mg/mL)

Calculate the percentage of the labeled amount of acetaminophen ($C_8H_9NO_2$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of acetaminophen from the Sample solution

r_S = peak response of acetaminophen from the Standard solution

C_S = concentration of USP Acetaminophen RS in the Standard solution (mg/mL)

C_U = nominal concentration of acetaminophen in the Sample solution (mg/mL)

Acceptance criteria: 90.0%–110.0% of the labeled amounts of oxycodone hydrochloride or oxycodone hydrochloride and oxycodone terephthalate, calculated as total oxycodone ($C_{18}H_{21}NO_4$), and 90.0%–110.0% of the labeled amount of acetaminophen ($C_8H_9NO_2$)

PERFORMANCE TESTS**• DISSOLUTION, Procedure for a Pooled Sample (711)**

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 45 min

Sample solution: Sample per Dissolution (711). Dilute with Medium as needed.

Analysis: Determine the amounts of oxycodone ($C_{18}H_{21}NO_4$) and acetaminophen ($C_8H_9NO_2$) dissolved, using the procedure in the Assay, making any necessary volumetric adjustments, including adjusting the solution under test to a pH of about 5.5 before injecting.

Tolerances: NLT 75% (Q) of the labeled amounts of oxycodone ($C_{18}H_{21}NO_4$) and acetaminophen ($C_8H_9NO_2$) is dissolved.

• UNIFORMITY OF DOSAGE UNITS (905): Meet the requirements**ADDITIONAL REQUIREMENTS****• PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.**• USP REFERENCE STANDARDS (11)**

Suitability requirements

Resolution: NLT 2.4 between acetaminophen and oxycodone

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of oxycodone ($C_{18}H_{21}NO_4$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of oxycodone from the *Sample solution*

r_S = peak response of oxycodone from the *Standard solution*

C_S = concentration of USP Oxycodone RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of oxycodone in the *Sample solution* (mg/mL)

Calculate the percentage of the labeled amount of acetaminophen ($C_8H_9NO_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of acetaminophen from the *Sample solution*

r_S = peak response of acetaminophen from the *Standard solution*

C_S = concentration of USP Acetaminophen RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of acetaminophen in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0% of the labeled amount of oxycodone ($C_{18}H_{21}NO_4$), and 90.0%–110.0% of the labeled amount of acetaminophen ($C_8H_9NO_2$)

PERFORMANCE TESTS• **DISSOLUTION, Procedure for a Pooled Sample (711)**

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 45 min

Sample solution: Sample per *Dissolution* (711). Dilute with *Medium* as needed.

Analysis: Determine the amounts of oxycodone ($C_{18}H_{21}NO_4$) and acetaminophen ($C_8H_9NO_2$) dissolved, using the procedure in the Assay, and making any necessary volumetric adjustments, including adjusting the solution under test to a pH of about 5.5 before injecting.

Tolerances: NLT 75% (Q) of the labeled amounts of oxycodone ($C_{18}H_{21}NO_4$) and acetaminophen ($C_8H_9NO_2$) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements**ADDITIONAL REQUIREMENTS**• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.• **LABELING:** The Tablets may be labeled to indicate the content of oxycodone hydrochloride ($C_{18}H_{21}NO_4 \cdot HCl$) equivalent. Each mg of oxycodone is equivalent to 1.116 mg of oxycodone hydrochloride.• **USP REFERENCE STANDARDS (11)**

USP Acetaminophen RS

USP Oxycodone RS

Oxycodone and Aspirin Tablets

» Oxycodone and Aspirin Tablets contain Oxycodone Hydrochloride and Aspirin, or Oxycodone Hydrochloride, Oxycodone Terephthalate, and Aspirin. Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of oxycodone ($C_{18}H_{21}NO_4$), and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of aspirin ($C_9H_8O_4$).

Packaging and storage—Preserve in tight, light-resistant containers.

Labeling—Label the Tablets to state both the content of the oxycodone active moiety and the content or contents of the salt or salts of oxycodone used in formulating the article.

USP Reference standards (11)—

USP Aspirin RS
USP Oxycodone RS
USP Salicylic Acid RS

Identification—The retention times of the oxycodone peak and the aspirin peak in the chromatograms of the respective *Assay preparations* correspond to those of the corresponding analytes of the respective *Standard preparations*, as obtained in the *Assay for oxycodone* and the *Assay for aspirin*, respectively.

Dissolution, *Procedure for a Pooled Sample* (711)—

Medium: 0.05 M acetate buffer, prepared by mixing 2.99 g of sodium acetate trihydrate and 1.66 mL of glacial acetic acid with water to obtain 1000 mL of solution having a pH of 4.50 ± 0.05 ; 500 mL.

Apparatus 1: 50 rpm.

Time: 30 minutes.

Procedure—Determine the amount of $C_{18}H_{21}NO_4$ dissolved using the method for *Assay for oxycodone*, making any necessary volumetric adjustments. Determine the amount of $C_9H_8O_4$ dissolved from UV absorbances at the wavelength of the isobestic point of aspirin and salicylic acid at about 265 nm of filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a *Standard solution* having a known concentration of USP Aspirin RS in the same medium. [NOTE—Prepare the *Standard solution* at the time of use. An amount of alcohol not to exceed 1% of the total volume of the *Standard solution* may be used to bring the Reference Standard into solution prior to dilution with *Medium*.]

Tolerances—Not less than 80% (Q) of the labeled amount of $C_{18}H_{21}NO_4$ is dissolved in 30 minutes and not less than 75% (Q) of the labeled amount of $C_9H_8O_4$ is dissolved in 30 minutes.

Uniformity of dosage units (905): meet the requirements.

Salicylic acid—

Mobile phase—Dissolve 2 g of sodium 1-heptanesulfonate in a mixture of 850 mL of water and 150 mL of acetonitrile, and adjust with glacial acetic acid to a pH of 3.4. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Diluting solution—Prepare a mixture of acetonitrile and formic acid (99:1).

Standard preparation—Dissolve an accurately weighed quantity of USP Salicylic Acid RS in *Diluting solution* to obtain a solution having a known concentration of about 0.008 mg per mL.

Test preparation—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 380 mg of aspirin, to a 100-mL volumetric flask, add about 20 mL of *Diluting solution*, and sonicate for about 15 minutes. Dilute with *Diluting solution* to volume, and mix. Centrifuge a portion of this mixture, and use the clear supernatant as the *Test preparation*.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 299-nm detector and a 3.9-mm \times 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 4.0%.

Procedure—Separately inject equal volumes (about 20 μ L) of the *Test preparation* and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the responses for the salicylic acid peaks. Calculate the per-

centage of salicylic acid in the portion of Tablets taken by the formula:

$$10,000(C/a)(r_u/r_s)$$

in which C is the concentration, in mg per mL, of USP Salicylic Acid RS in the *Standard preparation*, a is the quantity, in mg, of aspirin in the portion of Tablets taken, as determined in the *Assay for aspirin*, and r_u and r_s are the salicylic acid peak responses obtained from the *Test preparation* and the *Standard preparation*, respectively: not more than 3.0% is found.

Assay for aspirin—[NOTE—Volumetric flasks should be dried at 105° for not less than 1 hour, and cooled in a desiccator before use.]

Mobile phase—Prepare a mixture of n-heptane and glacial acetic acid (96:4), and filter through a filter of 0.5 μ m or finer porosity. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Internal standard solution—Prepare solution of 1-naphthol in chloroform containing about 1 mg per mL. [NOTE—Protect this solution from light.]

Standard preparation—Transfer about 163 mg of USP Aspirin RS, accurately weighed, to a 50-mL volumetric flask. Add 2.5 mL of glacial acetic acid, and swirl. Add 25 mL of chloroform, and shake for 10 minutes. Add 5.0 mL of *Internal standard solution*, dilute with chloroform to volume, and mix. [NOTE—Protect this solution from light.]

Assay preparation—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 325 mg of aspirin, to a 100-mL volumetric flask, add 5 mL of glacial acetic acid, and swirl. Add 50 mL of chloroform, and shake for 10 minutes. Add 10.0 mL of the *Internal standard solution*, dilute with chloroform to volume, mix, and filter. [NOTE—Prepare the *Assay preparation* and the *Standard preparation* concomitantly, and protect from light.]

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 300-nm detector and a 4.6-mm \times 25-cm column containing packing L3. The flow rate is about 4 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution, R, between the 1-naphthol peak and the aspirin peak is not less than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 20 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.65 for 1-naphthol and 1.0 for aspirin. Calculate the quantity, in mg, of Aspirin ($C_9H_8O_4$) in the portion of Tablets taken by the formula:

$$100C(R_u/R_s)$$

in which C is the concentration, in mg per mL, of USP Aspirin RS in the *Standard preparation*, and R_u and R_s are the ratios of the aspirin peak response to the 1-naphthol peak response obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Assay for oxycodone—

Mobile phase—Dissolve 2.2 g of sodium 1-octanesulfonate in 740 mL of water, add 260 mL of methanol, 10 mL of glacial acetic acid, and 0.1 mL of triethylamine. Mix, and adjust with 5 N sodium hydroxide to a pH of 6.5 ± 0.1 . Filter through a suitable filter of 0.5 μ m or finer porosity, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Diluting solution—Use 0.1 N hydrochloric acid.

Internal standard solution—Transfer about 50 mg of ethylparaben to a 500-mL volumetric flask, add 10 mL of methanol, and swirl to dissolve. Dilute with *Diluting solution* to volume, and mix.

Standard preparation—Dissolve an accurately weighed quantity of USP Oxycodone RS in *Diluting solution*, and dilute quantitatively with *Diluting solution* to obtain a stock solution having a known concentration of about 0.75 mg per mL. Transfer 15.0 mL of this stock solution to a second 100-mL volumetric flask, add 20.0 mL of *Internal standard solution*, dilute with *Diluting solution* to volume, and mix to obtain a *Standard preparation* having a known concentration of about 0.112 mg of USP Oxycodone RS per mL.

Assay preparation—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 11.2 mg of oxycodone, to a suitable glass-stoppered conical flask, add 50.0 mL of *Diluting solution*, and shake by mechanical means for about 30 minutes. Filter this solution, transfer 25.0 mL of the clear filtrate to a 50-mL volumetric flask, add 10.0 mL of *Internal standard solution*, dilute with *Diluting solution* to volume, and mix. Use this solution as the *Assay preparation*.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 3.9-mm × 15-cm column that contains packing L1 and is maintained at a temperature of 50 ± 1.0°. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*: the column efficiency, determined from the oxycodone peak, is not less than 1800 theoretical plates, the resolution, *R*, between the oxycodone and the ethylparaben peaks is not less than 6, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 30 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.5 for oxycodone and 1.0 for ethylparaben. Calculate the quantity, in mg, of oxycodone (C₁₈H₂₁NO₄) in the portion of Tablets taken by the formula:

$$100C(R_U/R_S)$$

in which *C* is the concentration, in mg per mL, of USP Oxycodone RS in the *Standard preparation*, and *R_U* and *R_S* are the ratios of the responses of the oxycodone peak and the ethylparaben peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Oxycodone Terephthalate

(C₁₈H₂₁NO₄)₂ · C₈H₆O₄ 796.86
Morphinan-6-one, 4,5-epoxy-14-hydroxy-3-methoxy-17-methyl-, 1,4-benzenedicarboxylate (2:1 salt), (5α); 4,5α-Epoxy-14-hydroxy-3-methoxy-17-methylmorphinan-6-one 1,4-benzenedicarboxylate (2:1 salt) [64336-55-6].

DEFINITION

Oxycodone Terephthalate contains NLT 97.0% and NMT 103.0% of oxycodone terephthalate (C₁₈H₂₁NO₄)₂ · C₈H₆O₄, calculated on the dried basis.

IDENTIFICATION

A. MELTING RANGE OR TEMPERATURE (741)

Sample solution: Transfer 50 mL of the filtrate retained from the test for *Content of Terephthalate Acid* to a 125-mL conical flask. Render the solution alkaline with 6 N ammonium hydroxide. Allow the mixture to stand until a precipitate is formed. Filter, wash the precipitate with 50 mL of cold water, and dry for 2 h at 105°.

Acceptance criteria: The precipitate melts between 218° and 223°, but the range between the beginning and end of the melting does not exceed 2°.

B. INFRARED ABSORPTION (197K)

Sample: Use a portion of the dried precipitate obtained in *Identification test A*.

Acceptance criteria: Meets the requirements

C. ULTRAVIOLET ABSORPTION (197U)

Sample solution: 150 µg/mL in 0.1 N hydrochloric acid

Acceptance criteria: Exhibits a maxima at 280 nm

ASSAY

PROCEDURE

Mobile phase: To 2.2 g of sodium 1-octanesulfonate in 740 mL of water add 260 mL of methanol, 10 mL of glacial acetic acid, and 0.1 mL of triethylamine. Mix, and adjust with 5 N sodium hydroxide to a pH of 6.5 ± 0.1. Pass through a filter of 0.5-µm or finer pore size.

Diluent: 0.1 N hydrochloric acid

Internal standard solution: 0.1 mg/mL of ethylparaben prepared by dissolving in 2% of the flask volume of methanol and diluting with *Diluent* to volume

Standard stock solution: 0.75 mg/mL of USP Oxycodone RS in *Diluent*

Standard solution: 0.11 mg/mL of USP Oxycodone RS prepared as follows. Transfer 15.0 mL of *Standard stock solution* to a 100-mL volumetric flask, add 20.0 mL of *Internal standard solution*, and dilute with *Diluent* to volume.

Sample stock solution: 0.71 mg/mL of Oxycodone Terephthalate in *Diluent*. Filter, discarding the first 5 mL.

Sample solution: 0.14 mg/mL of Oxycodone Terephthalate prepared as follows. Transfer 10.0 mL of the *Sample stock solution* to a 50-mL volumetric flask, add 10.0 mL of *Internal standard solution*, and dilute with *Diluent* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 3.9-mm × 15-cm; packing L1

Column temperature: 50 ± 1.0°

Flow rate: 1 mL/min

Run time: Twice the retention time of the main oxycodone peak

Injection size: 30 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 6 between oxycodone and ethylparaben

Column efficiency: NLT 1800 theoretical plates

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of oxycodone terephthalate (C₁₈H₂₁NO₄)₂ · C₈H₆O₄ in the portion of Oxycodone Terephthalate taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

R_U = peak response ratio of oxycodone to ethylparaben from the *Sample solution*

R_S = peak response ratio of oxycodone to ethylparaben from the *Standard solution*

C_S = concentration of USP Oxycodone RS in the *Standard solution* (mg/mL)

- C_U = concentration of oxycodone in the *Sample solution* (mg/mL)
 M_{r1} = one-half of the molecular weight of oxycodone terephthalate, 398.43
 M_{r2} = molecular weight of oxycodone, 315.37
Acceptance criteria: 97.0%–103.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 1%

- **ORGANIC IMPURITIES**

Solution A: 2.2 g of sodium 1-octanesulfonate in 850 mL of water. Add 150 mL of methanol, 20 mL of glacial acetic acid, and 1.0 mL of triethylamine. Pass through a filter of 0.5- μ m or finer pore size.

Solution B: 2.2 g of sodium 1-octanesulfonate in 500 mL of water. Add 500 mL of methanol, 20 mL of glacial acetic acid, and 1.0 mL of triethylamine. Pass through a filter of 0.5- μ m or finer pore size.

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	90	10
30	80	20
50	0	100
55	0	100

Diluent: 0.1 N hydrochloric acid

Standard stock solution: 0.9 mg/mL of USP Oxycodone RS in *Diluent*

Standard solution: 0.09 mg/mL of USP Oxycodone RS from the *Standard stock solution*, prepared by adding to 20% of the flask volume of methanol, and diluting with *Diluent* to volume

System suitability stock solution: 0.05 mg/mL of 4-hydroxybenzoic acid isopropyl ester in methanol

System suitability solution: 0.01 mg/mL of 4-hydroxybenzoic acid isopropyl ester and 0.09 mg/mL of USP Oxycodone RS in *Diluent* from the *System suitability stock solution* and *Standard stock solution*, respectively

Sample solution: 11 mg/mL of Oxycodone Terephthalate in methanol prepared as follows. Transfer the required amount of sample to a suitable volumetric flask. Add 80% of the flask volume of methanol, and shake by mechanical means for about 20 min to dissolve. Dilute with methanol to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 3.9-mm \times 15-cm; packing L1

Column temperature: 45 \pm 1°

Flow rate: 1.5 mL/min

Injection size: 25 μ L

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 8 between the oxycodone and 4-hydroxybenzoic acid isopropyl ester peaks, *System suitability solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of the sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak area of an individual impurity from the *Sample solution*

r_S = peak area of oxycodone from the *Standard solution*

C_S = concentration of USP Oxycodone RS in the *Standard solution* (mg/mL)

C_U = concentration of Oxycodone Terephthalate in the *Sample solution* (mg/mL)

M_{r1} = one-half of the molecular weight of oxycodone terephthalate, 398.43

M_{r2} = molecular weight of oxycodone, 315.37

[NOTE—If any impurity is found having a retention time of about 2 in relation to that of the oxycodone peak, divide its apparent percentage by 4.8.]

Acceptance criteria

Individual impurities: NMT 1.0%

Total impurities: NMT 2.0%

SPECIFIC TESTS

- **CONTENT OF TEREPHTHALIC ACID**

Sample solution: Transfer 1 g into a 50-mL beaker. Add 25 mL of 0.2 N hydrochloric acid, and heat to boiling with continuous stirring. Cover the beaker with a watch glass, and allow to cool to room temperature. Pass the suspension through a tared, medium-porosity filtering crucible. Transfer any material remaining in the beaker to the crucible with the aid of small portions of cold 0.2 N hydrochloric acid. Wash the material in the crucible with several portions of cold 0.2 N hydrochloric acid. [NOTE—Reserve the combined filtrates for use in *Identification test A*.]

Analysis: Dry the material in the crucible at 105° for 1 h, allow to cool, and reweigh. The material in the crucible is terephthalic acid. Determine the weight of terephthalic acid, and calculate the percentage of terephthalic acid.

Acceptance criteria: Between 20.2% and 21.5% of terephthalic acid ($C_8H_6O_4$) in Oxycodone Terephthalate on the dried basis

- **LOSS ON DRYING** (731): Dry a sample at 105° for 4 h: it loses NMT 1.5% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

- **USP REFERENCE STANDARDS** (11)

USP Oxycodone RS

Oxygen

O₂

32.00

Oxygen [7782-44-7].

DEFINITION

Oxygen contains NLT 99.0% of oxygen (O₂) by volume.

IDENTIFICATION

- **A.** The paramagnetic signal exhibited by the *Sample gas* in the *Assay* confirms the presence of oxygen.
- **B.** The *Sample gas* in the *Assay* meets the *Acceptance criteria*.

ASSAY

- **PROCEDURE**

The certified standards called for in the following test are listed in *Reagents, Indicators, and Solutions*.

Zero gas: Nitrogen certified standard

Span gas: Oxygen certified standard

Sample gas: Oxygen under test

Mode: Paramagnetic oxygen measurement (see *Medical Gases Assay* (415))

Analysis: Determine the concentration of oxygen in percentage by volume in Oxygen using a suitable paramagnetic analyzer.

Acceptance criteria: NLT 99.0% by volume

IMPURITIES

See *Impurities Testing in Medical Gases Assay* (413). The detector tubes called for in the following tests are listed in *Reagents, Indicators, and Solutions*. If the label indicates that Oxygen is produced by the air-liquefaction process, then the *Impurities* tests are not required.

- **LIMIT OF CARBON DIOXIDE**

Sample: Detector tube manufacturer's recommended volume, $\pm 5\%$ of Oxygen

Analysis: Pass the *Sample* through a carbon dioxide detector tube at the rate specified for the tube by the detector tube manufacturer.

Acceptance criteria: NMT 300 ppm

- **LIMIT OF CARBON MONOXIDE**

Sample: Detector tube manufacturer's recommended volume, $\pm 5\%$ of Oxygen

Analysis: Pass the *Sample* through a carbon monoxide detector tube at the rate specified for the tube by the detector tube manufacturer.

Acceptance criteria: NMT 10 ppm

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in pressurized containers. Container connections shall be appropriate for Oxygen. Adaptors shall not be used to connect containers to patient-use supply system piping or equipment.
- **LABELING:** Label states if Oxygen was produced by the air-liquefaction process. Where it is piped directly from the cylinder or storage tank to the patient point of use, label each outlet "Oxygen".

Oxygen 93 Percent

DEFINITION

Oxygen 93 Percent is Oxygen produced from air by the molecular sieve process. It contains NLT 90.0% and NMT 96.0% by volume of oxygen (O_2), the remainder consisting mostly of argon and nitrogen.

IDENTIFICATION

- **A.** The paramagnetic signal exhibited by the *Sample gas* in the Assay confirms the presence of oxygen.
- **B.** The *Sample gas* in the Assay meets the *Acceptance criteria*.

ASSAY

- **PROCEDURE**

The certified standards called for in the following test are listed in *Reagents, Indicators, and Solutions*.

Zero gas: Nitrogen certified standard

Span gas: 93% Oxygen certified standard

Sample gas: Oxygen 93 Percent under test

Mode: Paramagnetic oxygen measurement (see *Medical Gases Assay* (415))

Analysis: Determine the concentration of oxygen in percentage by volume in Oxygen 93 Percent using a suitable paramagnetic analyzer.

Acceptance criteria: 90.0%–96.0% oxygen by volume

IMPURITIES

See *Impurities Testing in Medical Gases Assay* (413). The detector tubes called for in the following tests are listed in *Reagents, Indicators, and Solutions*.

- **CARBON DIOXIDE**

Sample: Detector tube manufacturer's recommended volume $\pm 5\%$ of Oxygen 93 Percent

Analysis: Pass the *Sample* through a carbon dioxide detector tube at the rate specified for the tube by the detector tube manufacturer.

Acceptance criteria: NMT 300 ppm

- **CARBON MONOXIDE**

Sample: Detector tube manufacturer's recommended volume $\pm 5\%$ of Oxygen 93 Percent

Analysis: Pass the *Sample* through a carbon monoxide detector tube at the rate specified for the tube by the detector tube manufacturer.

Acceptance criteria: NMT 10 ppm

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in pressurized containers. Container connections shall be appropriate for Oxygen 93 Percent. Adaptors shall not be used to connect containers to patient use supply system piping or equipment.
- **LABELING:** If Oxygen 93 Percent is piped from a remote location to the patient point of use, label each outlet "Oxygen 93 Percent".

Oxymetazoline Hydrochloride

$C_{16}H_{24}N_2O \cdot HCl$ 296.84

Phenol, 3-[(4,5-dihydro-1H-imidazol-2-yl)methyl]-6-(1,1-dimethylethyl)-2,4-dimethyl-, monohydrochloride; 6-tert-Butyl-3-(2-imidazolin-2-ylmethyl)-2,4-dimethylphenol monohydrochloride [2315-02-8].

DEFINITION

Oxymetazoline Hydrochloride contains NLT 98.5% and NMT 101.5% of oxymetazoline hydrochloride ($C_{16}H_{24}N_2O \cdot HCl$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197M)**
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.
- **C. IDENTIFICATION TESTS—GENERAL, Chloride (191)**
Sample solution: 50 mg in 3 mL of water
Analysis: To the *Sample solution* add 1 mL of 6 N ammonium hydroxide. Filter, and acidify the filtrate with nitric acid.
Acceptance criteria: The filtrate meets the requirements.

ASSAY

- **PROCEDURE**

Mobile phase: Methanol, 1 M sodium acetate, glacial acetic acid, and water (40:10:4:46)

Standard solution: 0.5 mg/mL of USP Oxymetazoline Hydrochloride RS in *Mobile phase*

Oxymetazoline Hydrochloride Ophthalmic Solution

DEFINITION

Oxymetazoline Hydrochloride Ophthalmic Solution is a sterile, buffered solution of Oxymetazoline Hydrochloride in water adjusted to a suitable tonicity. It contains NLT 90.0% and NMT 110.0% of the labeled amount of oxymetazoline hydrochloride ($C_{16}H_{24}N_2O \cdot HCl$). It contains a suitable preservative.

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.
- **B.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

• **PROCEDURE**

Mobile phase: Methanol, 1 M sodium acetate, glacial acetic acid, and water (40:10:4:46)

Standard solution: Prepare a solution of USP Oxymetazoline Hydrochloride RS in *Mobile phase* having a known concentration approximately equal to the labeled concentration of the Ophthalmic Solution.

Sample solution: Use the Ophthalmic Solution.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm or diode array. [NOTE—Use diode array detector to perform *Identification test B*.]

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0% for five replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of oxymetazoline hydrochloride ($C_{16}H_{24}N_2O \cdot HCl$) in the portion of Ophthalmic Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Oxymetazoline Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of oxymetazoline hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- **pH** (791): 5.8–6.8
- **STERILITY TESTS** (71): Meets the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS** (11)
USP Oxymetazoline Hydrochloride RS

Oxymetholone

$C_{21}H_{32}O_3$

332.48

Androstan-3-one, 17-hydroxy-2-(hydroxymethylene)-17-methyl-, (5 α ,17 β)-;

17 β -Hydroxy-2-(hydroxymethylene)-17-methyl-5 α -androstan-3-one [434-07-1].

DEFINITION

Oxymetholone contains NLT 97.0% and NMT 103.0% of oxymetholone ($C_{21}H_{32}O_3$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)

- **B. ULTRAVIOLET ABSORPTION** (197U)

Sample solution: 10 µg/mL in 0.01 N methanolic sodium hydroxide

Acceptance criteria: Meets the requirements

ASSAY

• **PROCEDURE**

Diluent: Alcohol and chloroform (50:50)

Standard solution: Prepare as directed in *Single-Steroid Assay* (511), using USP Oxymetholone RS.

Sample solution: Dissolve 20 mg of Oxymetholone, previously dried, in *Diluent*, and dilute with *Diluent* to 10.0 mL.

Instrumental conditions

Mode: UV

Analytical wavelength: Maximum at about 315 nm

Cell: 1 cm

Analysis

Samples: *Standard solution* and *Sample solution*

Proceed as directed in *Single-Steroid Assay* (511), *Procedure* through the third sentence of the second paragraph (ending with "50-mL centrifuge tube"), except use the *Standard solution* and the *Sample solution* in place of the *Standard Preparation* and the *Assay Preparation*, respectively. Use a mixture of benzene and alcohol (98:2) as the *Solvent*. To each tube add 25.0 mL of 0.01 N alcoholic sodium hydroxide, and shake for NLT 2 min. Centrifuge the tubes for 5 min, and determine the absorbances of the supernatants against the blank.

Calculate the percentage of oxymetholone ($C_{21}H_{32}O_3$) in the portion of Oxymetholone taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Oxymetholone RS in the *Standard solution* (mg/mL)

C_U = concentration of Oxymetholone in the *Sample solution* (mg/mL)

Acceptance criteria: 97.0%–103.0% on the dried basis

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE** (741): 172°–180°

- **OPTICAL ROTATION, Specific Rotation** (781S)

Sample solution: 20 mg/mL in dioxane

Acceptance criteria: +34° to +38°

- **LOSS ON DRYING** (731)

Analysis: Dry under vacuum over phosphorus pentoxide for 4 h.

Acceptance criteria: NMT 1.0%

- **COMPLETENESS OF SOLUTION**

Sample solution: 20 mg/mL in dioxane

Acceptance criteria: The solution is clear and free from undissolved solid.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

- **USP REFERENCE STANDARDS** (11)

USP Oxymetholone RS

Oxymetholone Tablets

DEFINITION

Oxymetholone Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of oxymetholone ($C_{21}H_{32}O_3$).

IDENTIFICATION

- **A. INFRARED ABSORPTION**

Sample: Nominally 50 mg of oxymetholone from powdered Tablets

Analysis: Mix the *Sample* with 15 mL of solvent hexane, and stir occasionally for 15 min. Centrifuge the mixture, and decant and discard the solvent hexane. Extract the residue with two 10-mL portions of solvent hexane, centrifuging and decanting as before, and discard the solvent hexane. Add 25 mL of chloroform to the residue, mix by shaking for 1–2 min, and filter. Evaporate

the filtrate to about 3 mL, add a few mL of solvent hexane to induce crystallization, and evaporate to dryness.

Acceptance criteria: The IR absorption spectrum of a potassium bromide dispersion prepared from the oxymetholone so obtained, and previously dried, exhibits maxima only at the same wavelengths as those of a similar preparation of USP Oxymetholone RS, crystallized from the same solvent mixture.

ASSAY

- **PROCEDURE**

Solution A: 4 g/L of sodium hydroxide in methanol

Solution B: 0.4 g/L of sodium hydroxide in methanol from *Solution A*

Standard solution: 10 µg/mL of USP Oxymetholone RS in *Solution B*. [NOTE—The solution is freshly prepared.]

Sample solution: Nominally 10 µg/mL of Oxymetholone prepared as follows. Transfer the equivalent of 20 mg of oxymetholone, from NLT 20 powdered Tablets, to a separator. Add 10 mL of water, and extract with three 25-mL portions of chloroform, filtering each extract through chloroform-washed cotton. Evaporate the combined chloroform extracts on a steam bath to dryness, reducing the application of heat as dryness is approached. Dissolve the residue in methanol, transfer to a 100-mL volumetric flask, dilute with methanol to volume, and mix. Transfer 5.0 mL of the solution to a 100-mL volumetric flask, add 10 mL of *Solution A*, and dilute with methanol to volume.

Instrumental conditions

Mode: UV

Analytical wavelength: Maximum at about 315 nm

Cell: 1 cm

Blank: *Solution B*

Analysis

Samples: *Standard solution* and *Sample solution*

Without delay, concomitantly determine the absorbances of the *Standard solution* and the *Sample solution*.

Calculate the percentage of the labeled amount of oxymetholone ($C_{21}H_{32}O_3$) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Oxymetholone RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of oxymetholone in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **DISSOLUTION** (711)

Medium: 0.05 M alkaline borate buffer, pH 8.5; 900 mL. [NOTE—See *Reagents, Indicators, and Solutions—Buffer Solutions*.]

Apparatus 1: 100 rpm

Time: 45 min

Standard solution: USP Oxymetholone RS in *Medium*.

[NOTE—An amount of acetonitrile not to exceed 5% of the total volume of the *Standard solution* may be used to bring the Reference Standard into solution before dilution with the *Medium*.]

Sample solution: Pass a portion of the solution under test through a suitable filter, and dilute with *Medium*, if necessary, to a concentration that is similar to that of the *Standard solution*.

Instrumental conditions

Mode: UV

Analytical wavelength: Maximum at about 313

Tolerances: NLT 75% (Q) of the labeled amount of oxymetholone ($C_{21}H_{32}O_3$) is dissolved.

• UNIFORMITY OF DOSAGE UNITS (905)

Procedure for content uniformity

Solution A and Solution B: Prepare as directed in the Assay.

Standard solution: 10 µg/mL of USP Oxymetholone RS in *Solution B*. [NOTE—The solution is freshly prepared.]

Sample solution: Transfer 1 finely powdered Tablet to a 100-mL volumetric flask with the aid of about 75 mL of methanol. Heat the methanol to boiling, and allow to remain at a temperature just below the boiling point for 15 min with occasional swirling. Cool to room temperature, dilute with methanol to volume, and mix. Centrifuge a portion of the mixture until the solution becomes clear. Transfer a portion of the supernatant, nominally equivalent to 1 mg of oxymetholone, to a 100-mL volumetric flask. Add 10 mL of *Solution A*, and dilute with methanol to volume.

Instrumental conditions

Mode: UV

Analytical wavelength: Maximum at about 315 nm

Cell: 1 cm

Blank: *Solution B*

Analysis

Samples: *Standard solution* and *Sample solution*
Without delay, concomitantly determine the absorbances of the *Standard solution* and the *Sample solution*.

Calculate the percentage of the labeled amount of oxymetholone (C₂₁H₃₂O₃) in the Tablet taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Oxymetholone RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of oxymetholone in the *Sample solution* (µg/mL)

Acceptance criteria: Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

- **USP REFERENCE STANDARDS (11)**

USP Oxymetholone RS

Oxymorphone Hydrochloride

C₁₇H₁₉NO₄ · HCl 337.80
Morphinan-6-one, 4,5-epoxy-3,14-dihydroxy-17-methyl-, hydrochloride, (5α)-;

4,5α-Epoxy-3,14-dihydroxy-17-methylmorphinan-6-one hydrochloride [357-07-3].

DEFINITION

Oxymorphone Hydrochloride contains NLT 97.0% and NMT 102.0% of oxymorphone hydrochloride (C₁₇H₁₉NO₄ · HCl), calculated on the dried basis.

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Chloride (191)**

Sample solution: Dissolve about 250 mg in 25 mL of water, and render the solution alkaline with a saturated

solution of sodium bicarbonate. Extract the liberated oxymorphone with two 15-mL portions of chloroform. Reserve the chloroform extracts for *Identification test B*. Acidify the aqueous phase with 2 N nitric acid.

Acceptance criteria: Meets the requirements

- **B.**

Standard solution: Similarly prepared as directed for the *Sample solution* by using USP Oxymorphone RS

Sample solution: Wash the combined chloroform extracts from *Identification test A* with 5 mL of water, and filter. Evaporate the chloroform solution on a steam bath nearly to dryness, then add a few mL of ether, and continue the evaporation with stirring until the solvent is removed. Dissolve the oxymorphone so obtained with alcohol-free chloroform to obtain a 1 in 50 solution.

Acceptance criteria: The IR absorption spectrum of the *Sample solution*, determined in a 0.5-mm cell, exhibits maxima only at the same wavelengths as those of the *Standard solution*.

- **C.**

Standard solution: Dissolve about 20 mg of USP Oxymorphone RS in 10 mL of 1 N hydrochloric acid, and dilute with water to 100.0 mL.

Sample solution: A solution (1 in 6500) in 0.1 N hydrochloric acid

Acceptance criteria: The UV absorption spectrum of the *Sample solution* exhibits maxima and minima at the same wavelengths as those of the *Standard solution*. The ratio A_{281}/A_{264} is 1.75 ± 0.2 .

- **D.**

Sample solution: Dissolve 10 mg in 1 mL of water.

Analysis: To the *Sample solution* add a few drops of ferric chloride TS.

Acceptance criteria: A blue color is produced immediately.

ASSAY

• PROCEDURE

Sample solution: Transfer about 700 mg of Oxymorphone Hydrochloride to a glass-stoppered flask containing 50 mL of glacial acetic acid and 10 mL of mercuric acetate TS. Add 3 mL of acetic anhydride and 1 drop of methyl violet TS.

Analysis: Titrate the *Sample solution* with 0.1 N perchloric acid VS to a clear blue color. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 33.78 mg of oxymorphone hydrochloride (C₁₇H₁₉NO₄ · HCl).

Acceptance criteria: 97.0%–102.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION (281):** NMT 0.3%

- **ORDINARY IMPURITIES (466)**

Sample solution: Methanol

Standard solution: Methanol

Eluent: Dehydrated alcohol, cyclohexane, and ammonium hydroxide (10:5:1)

Visualization: 1

Acceptance criteria: Meets the requirements

- **LIMIT OF NONPHENOLIC SUBSTANCES**

Analysis: Dissolve 1 g in 15 mL of water. Add 5 mL of sodium hydroxide solution (2 in 25), and extract with three 10-mL portions of chloroform. Filter the combined extracts through a small chloroform-moistened filter paper, and wash the filtrate with 5 mL of water. Filter the chloroform layer through chloroform-moistened filter paper into a tared, 50-mL beaker, and evaporate on a steam bath with the aid of a gentle current of filtered air to dryness. Dry the beaker and residue at 105° for 1 h, and weigh.

Acceptance criteria: The residue so obtained does not exceed 15 mg.

SPECIFIC TESTS**• CONTENT OF CHLORIDE**

Sample solution: Dissolve about 300 mg in 50 mL of methanol in a glass-stoppered flask. Add 5 mL of glacial acetic acid and 3 drops of eosin Y TS.

Analysis: Titrate the *Sample solution* with 0.1 N silver nitrate VS. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of chloride.

Acceptance criteria: 10.2%–10.8% on the dried basis

• OPTICAL ROTATION, Specific Rotation (781S)

Sample solution: 100 mg/mL in water

Acceptance criteria: -145° to -155°

• ACIDITY

Analysis: Dissolve 300 mg in 10 mL of water. Add 1 drop of methyl red TS, and titrate with 0.020 N sodium hydroxide.

Acceptance criteria: NMT 0.30 mL is required to produce a yellow color.

• LOSS ON DRYING (731)

Analysis: Dry at 105° for 18 h.

Acceptance criteria: NMT 8.0%

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at 25° , excursions permitted between 15° and 30° .

• USP REFERENCE STANDARDS (11)

USP Oxymorphone RS

Oxymorphone Hydrochloride Injection**DEFINITION**

Oxymorphone Hydrochloride Injection is a sterile solution of Oxymorphone Hydrochloride in Water for Injection. It contains NLT 93.0% and NMT 107.0% of the labeled amount of oxymorphone hydrochloride ($C_{17}H_{19}NO_4 \cdot HCl$).

IDENTIFICATION

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- B.** The UV absorption spectra of the major peak of the *Sample solution* and that of the *Standard solution* exhibit maxima and minima at the same wavelengths, as obtained in the *Assay*.

ASSAY**• PROCEDURE**

Protect all solutions containing oxymorphone from light and use clear glass HPLC vials.

Solution A: Dissolve 2.02 g of sodium 1-heptanesulfonate in 900 mL of water. Add 100 mL of acetonitrile. Adjust with phosphoric acid to a pH of 2.1.

Solution B: Dissolve 2.02 g of sodium 1-heptanesulfonate in 750 mL of water. Add 250 mL of acetonitrile. Adjust with phosphoric acid to a pH of 2.1.

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
3	100	0
35	0	100
40	0	100
40.1	100	0
50.1	100	0

Diluent: Dissolve 2.02 g of anhydrous sodium 1-heptanesulfonate in 1000 mL of water. Adjust with phosphoric acid to a pH of 2.1.

Standard solution: 0.14 mg/mL of USP Oxymorphone RS prepared as follows. Transfer a suitable amount of USP Oxymorphone RS to a suitable volumetric flask. Add 50% of the flask volume of *Diluent*. Sonicate to dissolve, if necessary. Add 9% of the flask volume of acetonitrile. Cool to room temperature and dilute with *Diluent* to volume.

Sample solution: Nominally 0.15 mg/mL of oxymorphone hydrochloride from Injection prepared as follows. Transfer a suitable volume of the composite sample from NLT 20 ampules to a suitable volumetric flask. Dilute with *Solution A* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector

Assay: UV 230 nm

Identification test B: Diode array UV 200–360 nm

Column: 4.6-mm \times 7.5-cm; 3.5- μ m packing L1

Column temperature: 40°

Flow rate: 1.0 mL/min

Injection volume: 30 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of oxymorphone hydrochloride ($C_{17}H_{19}NO_4 \cdot HCl$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of oxymorphone from the *Sample solution*

r_S = peak response of oxymorphone from the *Standard solution*

C_S = concentration of USP Oxymorphone RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of oxymorphone hydrochloride in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of oxymorphone hydrochloride, 337.80

M_{r2} = molecular weight of oxymorphone, 301.34

Acceptance criteria: 93.0%–107.0%

IMPURITIES**• ORGANIC IMPURITIES**

Protect all solutions containing oxymorphone from light and use clear glass HPLC vials.

Solution A, Solution B, Mobile phase, Diluent, Sample solution, and Chromatographic system: Proceed as directed in the *Assay*.

System suitability stock solution A: 0.2 mg/mL of USP Oxymorphone Related Compound A RS prepared as follows. Transfer a suitable amount of USP Oxymorphone Related Compound A RS to a suitable volumetric flask. Dissolve with 24% of the flask volume of 0.1 N hydrochloric acid and dilute with acetonitrile to volume.

System suitability stock solution B: 0.02 mg/mL of USP Oxymorphone Related Compound A RS in acetonitrile from *System suitability stock solution A*

System suitability stock solution C: 0.14 mg/mL of USP Oxymorphone RS prepared as follows. Transfer a suitable amount of USP Oxymorphone RS to a suitable volumetric flask. Add 50% of the flask volume of *Diluent*. Sonicate to dissolve if necessary. Add 9% of the flask volume of acetonitrile. Cool to room temperature and dilute with *Diluent* to volume.

System suitability solution: 0.0008 mg/mL of USP Oxymorphone Related Compound A RS in *System suitability stock solution C* from *System suitability stock solution B*

Standard solution: 0.00014 mg/mL of USP Oxymorphone RS prepared as follows. Dilute *System suitability stock solution C* with *Solution A*.

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 2 between oxymorphone related compound A and oxymorphone, *System suitability solution*

Relative standard deviation: NMT 10%, *Standard solution*

Analysis

Sample: *Sample solution*

Calculate the percentage of each individual degradation product in the portion of Injection taken:

$$\text{Result} = \left\{ \frac{r_U/F}{r_S + \Sigma(r_U/F)} \right\} \times 100$$

r_U = peak response of each individual degradation product from the *Sample solution*

F = relative response factor of each individual degradation product (see *Table 2*)

r_S = peak response of oxymorphone from the *Sample solution*

Acceptance criteria: See *Table 2*. Disregard any peaks less than 0.05%.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)

Oxymorphone Hydrochloride Extended-Release Tablets

DEFINITION

Oxymorphone Hydrochloride Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of oxymorphone hydrochloride (C₁₇H₁₉NO₄ · HCl).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.
- **B.** The UV absorption spectra of the major peak of the *Sample solution* and that of the *Standard solution* exhibit maxima and minima at the same wavelengths, as obtained in the Assay.

ASSAY• **PROCEDURE**

Solution A: Dissolve 2.34 g of sodium 1-octanesulfonate monohydrate in 1000 mL of water. Adjust with phosphoric acid to a pH of 2.80.

Solution B: Acetonitrile and methanol (50:50)

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0.00	77.0	23.0
2.50	77.0	23.0

Table 1 (Continued)

Time (min)	Solution A (%)	Solution B (%)
17.50	54.0	46.0
25.00	31.0	69.0
25.05	1.5	98.5
32.50	1.5	98.5
32.55	77.0	23.0
38.00	77.0	23.0

Diluent: Methanol and phosphoric acid (1000:1)

Standard stock solution: 1.78 mg/mL of USP Oxymorphone RS in *Diluent*

Standard solution: 0.357 mg/mL of USP Oxymorphone RS in *Solution A* from the *Standard stock solution*

Sample stock solution: Nominally 2 mg/mL of oxymorphone hydrochloride in *Diluent* prepared as follows. Take NLT 8 Tablets, cut each into small pieces, and transfer to a suitable flask. Add a suitable volume of *Diluent* and shake for at least 16 h. Centrifuge at 3500 rpm for 5 min or until a clear supernatant is obtained.

Sample solution: Nominally 0.4 mg/mL of oxymorphone hydrochloride in *Solution A* from the *Sample stock solution*

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector

Assay: UV 230 nm

Identification test B: Diode array UV 200–360 nm

Column: 4.6-mm × 7.5-cm; 3.5- μ m packing L1

Column temperature: 50°

Flow rate: 1.0 mL/min

Injection volume: 20 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: 0.8–1.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of oxymorphone hydrochloride (C₁₇H₁₉NO₄ · HCl) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of oxymorphone from the *Sample solution*

r_S = peak response of oxymorphone from the *Standard solution*

C_S = concentration of USP Oxymorphone RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of oxymorphone hydrochloride in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of oxymorphone hydrochloride, 337.80

M_{r2} = molecular weight of oxymorphone, 301.34

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS• **DISSOLUTION <711>**

Medium: 45 mM phosphate buffer pH 4.50 (Dissolve 6.16 g of monobasic potassium phosphate in 1 L of water. Adjust with 1 N sodium hydroxide or phosphoric acid to a pH of 4.50); 900 mL

Apparatus 2: 50 rpm, with sinker. [NOTE—The Sotax Helix sinker can be used.]

Time: 1, 2, and 8 h

Mobile phase: Dissolve 1.54 g of ammonium acetate in 925 mL of water and mix well. Add 75 mL of acetonitrile and adjust with trifluoroacetic acid to a pH of 4.50.

Standard stock solution: 0.2 mg/mL of USP Oxymorphone RS in *Medium*
Standard solution: $[(L/900) \times (301.34/337.80)]$ mg/mL of USP Oxymorphone RS in *Medium* from the *Standard stock solution*, where *L* is the label claim in mg/Tablet
Sample solution: Withdraw 1.5 mL of the solution under test

Chromatographic system(See *Chromatography* (621), *System Suitability*.)**Mode:** LC**Detector:** UV 230 nm**Column:** 4.6-mm \times 7.5-cm; 4- μ m packing L11**Column temperature:** 60°**Flow rate:** 2.0 mL/min**Injection volume:** 50 μ L**Run time:** NLT 2 times the retention time of oxymorphone**System suitability****Sample:** *Standard solution***Suitability requirements****Tailing factor:** 0.8–1.5**Relative standard deviation:** NMT 2.0%**Analysis****Samples:** *Standard solution* and *Sample solution*Calculate the percentage of the labeled amount of oxymorphone hydrochloride ($C_{17}H_{19}NO_4 \cdot HCl$) dissolved at each time point (*i*):

$$\text{Result}_i = (r_U/r_S) \times C_S \times (M_{r1}/M_{r2}) \times V \times (1/L) \times 100$$

r_U = peak response of oxymorphone from the *Sample solution**r_S* = peak response of oxymorphone from the *Standard solution**C_S* = concentration of USP Oxymorphone RS in the *Standard solution* (mg/mL)*M_{r1}* = molecular weight of oxymorphone hydrochloride, 337.80*M_{r2}* = molecular weight of oxymorphone, 301.34*V* = volume of *Medium*, 900 mL*L* = label claim (mg/Tablet)**Tolerances:** See *Table 2*.**Table 2**

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at 25°, excursions permitted between 15° and 30°.
- **USP REFERENCE STANDARDS** (11)
USP Oxymorphone RS

Oxytetracycline $C_{22}H_{24}N_2O_9 \cdot 2H_2O$ 496.46

2-Naphthacenecarboxamide, 4-(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,5,6,10,12,12a-hexahydroxy-6-methyl-1,11-dioxo-, [4S-(4 α ,4a α ,5 α ,5a α ,6 β ,12a α)]-, dihydrate.

4-(Dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,5,6,10,12,12a-hexahydroxy-6-methyl-1,11-dioxo-2-naphthacene-carboxamide dihydrate [6153-64-6].
Anhydrous 460.44 [79-57-2].

» Oxytetracycline has a potency equivalent to not less than 832 μg of $\text{C}_{22}\text{H}_{24}\text{N}_2\text{O}_9$ per mg.

Packaging and storage—Preserve in tight, light-resistant containers.

Labeling—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

USP Reference standards (11)—

USP Endotoxin RS

USP Oxytetracycline RS

Identification—

A: Ultraviolet Absorption (197U)—

Solution: 20 μg per mL.

Medium: 0.1 N hydrochloric acid.

Absorptivity at 353 nm, calculated on the anhydrous basis, is between 96.0% and 104.0% of that of USP Oxytetracycline RS, the potency of the Reference Standard being taken into account.

B: To 1 mg add 2 mL of sulfuric acid: a light red color is produced.

Crystallinity (695): meets the requirements.

pH (791): between 4.5 and 7.0, in an aqueous suspension containing 10 mg per mL.

Water Determination, Method I (921): between 6.0% and 9.0%.

Other requirements—Where the label states that Oxytetracycline is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under *Oxytetracycline for Injection*. Where the label states that Oxytetracycline must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Oxytetracycline for Injection*.

Assay—

Tetrabutylammonium hydrogen sulfate solution—Dissolve 1 g of tetrabutylammonium hydrogen sulfate in 100 mL of water. Adjust with 1 N sodium hydroxide to a pH of 7.5.

Edetate disodium solution—Dissolve 0.04 g of edetate disodium in 100 mL of water. Adjust with 1 N sodium hydroxide to a pH of 7.5.

pH 7.5 Phosphate buffer—Prepare a mixture of 0.33 M dibasic potassium phosphate and 0.33 M monobasic sodium phosphate (85:15). Adjust, if necessary, by adding more of the appropriate component to a pH of 7.5.

Mobile phase—Transfer, with the aid of 200 mL of water, 50 g of tertiary butyl alcohol to a 1000-mL volumetric flask. Add 60 mL of pH 7.5 Phosphate buffer, 50 mL of Tetrabutylammonium hydrogen sulfate solution, and 10 mL of Edetate disodium solution, and dilute with water to volume. Degas before use. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Dissolve an accurately weighed quantity of USP Oxytetracycline RS in 0.01 N hydrochloric acid to obtain a solution having a known concentration of about 0.22 mg per mL.

System suitability solution—Prepare a solution of tetracycline hydrochloride in 0.01 N hydrochloric acid containing about 0.2 mg per mL. Mix 3 mL of this solution and 1.5 mL of the *Standard preparation*, and dilute with water to 25 mL.

Assay preparation—Transfer about 44 mg of Oxytetracycline to a 200-mL volumetric flask, add about 25 mL of 0.01 N hydrochloric acid, swirl to dissolve, dilute with 0.01 N hydrochloric acid to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm \times 25-cm column that contains packing L21 and is maintained at $60 \pm 2^\circ$. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.6 for oxytetracycline and 1.0 for tetracycline; and the resolution, R , between the oxytetracycline peak and the tetracycline peak is not less than 5. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 1.25; and the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in μg , of $\text{C}_{22}\text{H}_{24}\text{N}_2\text{O}_9$ in each mg of the Oxytetracycline taken by the formula:

$$200(\text{CP} / W)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Oxytetracycline RS in the *Standard preparation*; P is the assigned potency, in μg per mg, of USP Oxytetracycline RS; W is the weight, in mg, of the Oxytetracycline taken to prepare the *Assay preparation*; and r_U and r_S are the oxytetracycline peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Oxytetracycline Injection

» Oxytetracycline Injection is a sterile solution of Oxytetracycline with or without one or more suitable anesthetics, antioxidants, buffers, complexing agents, preservatives, and solvents. It contains the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of Oxytetracycline ($\text{C}_{22}\text{H}_{24}\text{N}_2\text{O}_9$).

Packaging and storage—Preserve in single-dose or multiple-dose containers, protected from light.

USP Reference standards (11)—

USP Endotoxin RS

USP Oxytetracycline RS

Identification—To an accurately measured volume of Injection, equivalent to about 50 mg of oxytetracycline, add 50 mL of methanol, and shake. Using the clear solution so obtained as the *Test Solution*, proceed as directed for *Method II* under *Identification—Tetracyclines* (193).

Bacterial Endotoxins Test (85)—It contains not more than 0.4 USP Endotoxin Unit per mg of oxytetracycline.

Sterility Tests (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

pH (791): between 8.0 and 9.0.

Assay—

Tetrabutylammonium hydrogen sulfate solution, Edetate disodium solution, pH 7.5 Phosphate buffer, Mobile phase, Standard preparation, System suitability solution, and Chromatographic system—Proceed as directed in the *Assay* under *Oxytetracycline*.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 100 mg of oxytetracycline, to a 500-mL volumetric flask, dilute with 0.01 N hydrochloric acid to volume, and mix.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Oxytetracycline*. Calculate the quantity, in mg, of $C_{22}H_{24}N_2O_9$ in each mL of the *Injection* taken by the formula:

$$0.5(CP / V)(r_u / r_s)$$

in which *C* is the concentration, in mg per mL, of USP Oxytetracycline RS in the *Standard preparation*; *V* is the volume, in mL, of *Injection* taken to prepare the *Assay preparation*; and the other terms are as defined therein.

Oxytetracycline Tablets

» Oxytetracycline Tablets contain the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of $C_{22}H_{24}N_2O_9$.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Oxytetracycline RS

Identification—Shake a suitable quantity of finely powdered Tablets with methanol to obtain a solution containing about 1 mg of oxytetracycline per mL, and filter. Using the filtrate as the *Test Solution*, proceed as directed for *Method II* under *Identification—Tetracyclines* (193).

Dissolution (711)—

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 1: 100 rpm.

Time: 45 minutes.

Procedure—Determine the amount of $C_{22}H_{24}N_2O_9$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 353 nm of filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Oxytetracycline RS in the same medium.

Tolerances—Not less than 75% (*Q*) of the labeled amount of $C_{22}H_{24}N_2O_9$ is dissolved in 45 minutes.

Uniformity of dosage units (905): meet the requirements.

Water Determination, Method I (921): not more than 7.5%.

Assay—

Tetrabutylammonium hydrogen sulfate solution, Edetate disodium solution, pH 7.5 Phosphate buffer, Mobile phase, Standard preparation, Resolution solution, and Chromatographic system—Proceed as directed in the *Assay* under *Oxytetracycline*.

Assay preparation—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of oxytetracycline, to a 500-mL volumetric flask, add about 25 mL of 0.01 N hydrochloric acid, and mix. Dilute with 0.01 N hydrochloric acid to volume, and mix. Filter a portion of this solution through a 0.5- μ m or finer porosity filter, and use the filtrate as the *Assay preparation*.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Oxytetracycline*. Calculate the quantity, in mg, of $C_{22}H_{24}N_2O_9$ in the portion of Tablets taken by the formula:

$$0.5(CP)(r_u / r_s)$$

in which *C* is the concentration, in mg per mL, of USP Oxytetracycline RS in the *Standard preparation*, and the other terms are as defined therein.

Oxytetracycline and Nystatin Capsules

» Oxytetracycline and Nystatin Capsules contain not less than 90.0 percent and not more than 120.0 percent of the labeled amount of oxytetracycline ($C_{22}H_{24}N_2O_9$), and not less than 90.0 percent and not more than 135.0 percent of the labeled amount of USP Nystatin Units.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Nystatin RS

USP Oxytetracycline RS

Identification—Shake a suitable quantity of Capsule contents with methanol to obtain a solution containing about 1 mg of oxytetracycline per mL, and filter. Using the filtrate as the *Test Solution*, proceed as directed for *Method II* under *Identification—Tetracyclines* (193).

Dissolution (711)—

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 1: 100 rpm.

Time: 45 minutes.

Procedure—Determine the amount of oxytetracycline ($C_{22}H_{24}N_2O_9$) dissolved from UV absorbances at the wavelength of maximum absorbance at about 353 nm of filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Oxytetracycline RS in the same medium.

Tolerances—Not less than 75% (*Q*) of the labeled amount of $C_{22}H_{24}N_2O_9$ is dissolved in 45 minutes.

Uniformity of dosage units (905): meet the requirements for *Weight Variation* with respect to oxytetracycline.

Water Determination, Method I (921): not more than 7.5%.

Assay for oxytetracycline—Place not less than 5 Capsules in a high-speed glass blender jar containing an accurately measured volume of 0.1 N hydrochloric acid, and blend for 3 to 5 minutes, so that the stock solution so obtained contains not less than 150 μ g of oxytetracycline ($C_{22}H_{24}N_2O_9$) per mL. Proceed as directed under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of this stock solution diluted quantitatively and stepwise with water to yield a *Test Dilution* having a concentration of oxytetracycline assumed to be equal to the median dose level of the Standard.

Change to read:

Assay for nystatin—Proceed as directed for Nystatin under *Antibiotics—Microbial Assays* (81), blending not less than 5 Capsules for 3 to 5 minutes in a high-speed blender with a sufficient accurately measured volume of dimethylformamide to obtain a solution of convenient concentration. Dilute an accurately measured portion of this solution quantitatively with dimethylformamide to obtain a stock solution containing about 400 USP Nystatin Units per mL. Dilute this stock solution quantitatively with ⁶Buffer B.6⁶ (CN 1-May-2017) to obtain a *Test Dilution* having a concentration of nystatin assumed to be equal to the median dose level of the Standard.

Oxytetracycline and Nystatin for Oral Suspension

» Oxytetracycline and Nystatin for Oral Suspension is a dry mixture of Oxytetracycline and Nystatin with one or more suitable buffers, colors, diluents, flavors, suspending agents, and preservatives. When constituted as directed in the labeling, it contains not less than 90.0 percent and not more than 120.0 percent of the labeled amount of oxytetracycline ($C_{22}H_{24}N_2O_9$), and not less than 90.0 percent and not more than 135.0 percent of the labeled amount of USP Nystatin Units.

Packaging and storage—Preserve in tight, light-resistant containers, at controlled room temperature.

USP Reference standards (11)—

USP Nystatin RS

USP Oxytetracycline RS

Identification—To a quantity of Oxytetracycline and Nystatin for Oral Suspension (powder), equivalent to about 50 mg of oxytetracycline, add 50 mL of methanol, shake, and allow the mixture to settle. Using the clear supernatant as the *Test Solution*, proceed as directed for *Method II* under *Identification*—*Tetracyclines* (193).

Uniformity of dosage units (905)—

FOR SOLID PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements for *Content Uniformity* with respect to oxytetracycline and nystatin.

Deliverable volume (698): meets the requirements.

pH (791): between 4.5 and 7.5, in the suspension constituted as directed in the labeling.

Water Determination, Method I (921): not more than 2.0%.

Assay for oxytetracycline—Constitute Oxytetracycline and Nystatin for Oral Suspension as directed in the labeling. Transfer an accurately measured volume of the suspension so obtained, freshly mixed and free from air bubbles, to a suitable volumetric flask, dilute with 0.1 N hydrochloric acid to volume so that the stock solution so obtained contains not less than 150 µg of oxytetracycline per mL, and mix. Proceed as directed for oxytetracycline under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of the stock solution diluted quantitatively and stepwise with water to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

Change to read:

Assay for nystatin—Constitute Oxytetracycline and Nystatin for Oral Suspension as directed in the labeling. Transfer an accurately measured volume of the suspension so obtained, freshly mixed and free from air bubbles, to a blender jar containing a sufficient, accurately measured volume of dimethylformamide to yield a solution of convenient concentration, and blend at high speed for 3 to 5 minutes. Dilute an accurately measured volume of this solution quantitatively with dimethylformamide to obtain a stock solution containing about 400 USP Nystatin Units per mL. Proceed as directed for nystatin under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of this solution diluted quantitatively with *Buffer B.6* (CN 1-May-2017) to yield a *Test Dilution* having a concentration of nystatin assumed to be equal to the median dose level of the Standard.

Oxytetracycline Calcium

$C_{44}H_{46}CaN_4O_{18}$ 958.93

2-Naphthacenecarboxamide, 4-(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,5,6,10,12,12a-hexahydroxy-6-methyl-1,11-dioxo-, calcium salt, [4S-(4α,4aα,5α,5aα,6β,12aα)]-
4-(Dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,5,6,10,12,12a-hexahydroxy-6-methyl-1,11-dioxo
2-naphthacenecarboxamide calcium salt [15251-48-6].

» Oxytetracycline Calcium has a potency equivalent to not less than 865 µg of oxytetracycline ($C_{22}H_{24}N_2O_9$) per mg, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight, light-resistant containers, and store in a cool place.

USP Reference standards (11)—

USP Oxytetracycline RS

Identification—Dissolve a suitable quantity in methanol to obtain a *Test Solution* containing 1 mg of oxytetracycline per mL, and proceed as directed for *Method II* under *Identification*—*Tetracyclines* (193).

Crystallinity (695): meets the requirements.

pH (791): between 6.0 and 8.0, in an aqueous suspension containing 25 mg per mL.

Water Determination, Method I (921): between 8.0% and 14.0%.

Calcium content—Proceed as directed under *Residue on Ignition* (281), except to ignite at $550 \pm 50^\circ$ instead of at $800 \pm 25^\circ$: the weight of residue so obtained, multiplied by 0.2944, gives the equivalent of calcium in the Oxytetracycline Calcium taken. The calcium content is between 3.85% and 4.35%, calculated on the anhydrous basis.

Assay—Dissolve an accurately weighed quantity of Oxytetracycline Calcium in an accurately measured volume of 0.1 N hydrochloric acid to obtain a stock solution having a concentration of about 1000 µg of oxytetracycline per mL. Proceed as directed for oxytetracycline under *Antibiotics—Microbial* (81), using an accurately measured volume of the stock solution diluted quantitatively and stepwise with water to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

Oxytetracycline Calcium Oral Suspension

» Oxytetracycline Calcium Oral Suspension contains the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of oxytetracycline ($C_{22}H_{24}N_2O_9$). It contains one or more suitable buffers, colors, flavors, preservatives, stabilizers, and suspending agents. In addition, it may contain N-acetylglucosamine.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Oxytetracycline RS

Identification—Shake a suitable quantity of Oral Suspension with methanol to obtain a solution containing 1 mg of oxytetracycline per mL, and filter. Using the filtrate as the *Test Solution*, proceed as directed for *Method II* under *Identification*—*Tetracyclines* (193).

Uniformity of dosage units (905)—

FOR SOLID PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

Deliverable volume (698): meets the requirements.

pH (791): between 5.0 and 8.0.

Assay—Transfer an accurately measured quantity of Oral Suspension, freshly mixed and free from air bubbles, equivalent to about 150 mg of oxytetracycline, to a 1000-mL volumetric flask, dilute with 0.1 N hydrochloric acid to volume, and mix. Proceed as directed for oxytetracycline under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of this stock solution diluted quantitatively and stepwise with water to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

Oxytetracycline Hydrochloride

$C_{22}H_{24}N_2O_9 \cdot HCl$ 496.89

2-Naphthacenecarboxamide, 4-(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,5,6,10,12,12a-hexahydroxy-6-methyl-1,11-dioxo-, monohydrochloride, [4S-(4 α ,4 α ,5 α ,5 α ,6 β ,12 α)]-
4-(Dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,5,6,10,12,12a-hexahydroxy-6-methyl-1,11-dioxo-2-naphthacenecarboxamide monohydrochloride [2058-46-0].

» Oxytetracycline Hydrochloride has a potency equivalent to not less than 835 μ g of oxytetracycline ($C_{22}H_{24}N_2O_9$) per mg, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers.

Labeling—Where it is intended for use in preparing injectable or ophthalmic dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable or ophthalmic dosage forms.

USP Reference standards (11)—

USP Endotoxin RS

USP Oxytetracycline RS

Identification—

A: Ultraviolet Absorption (197U)—

Solution: 20 μ g per mL.

Medium: 0.1 N hydrochloric acid.

Absorptivity, calculated on the dried basis, at 353 nm is between 88.2% and 96.8% of that of USP Oxytetracycline RS, the potency of the Reference Standard being taken into account.

B: To 1 mg add 2 mL of sulfuric acid: a light red color is produced.

Crystallinity (695): meets the requirements.

pH (791): between 2.0 and 3.0, in a solution containing 10 mg per mL.

Loss on drying (731)—Dry about 100 mg, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 2.0% of its weight.

Other requirements—Where the label states that Oxytetracycline Hydrochloride is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under *Oxytetracycline for Injection*. Where the label states that Oxytetracycline Hydrochloride must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Oxytetracycline for Injection*. Where it is intended for use in preparing ophthalmic

dosage forms, it is exempt from the requirements for *Bacterial endotoxins*.

Assay—

Tetrabutylammonium hydrogen sulfate solution, Edetate disodium solution, pH 7.5 Phosphate buffer, Mobile phase, Standard preparation, System suitability solution, and Chromatographic system—Proceed as directed in the Assay under *Oxytetracycline*.

Assay preparation—Transfer about 44 mg of Oxytetracycline Hydrochloride to a 200-mL volumetric flask, add about 25 mL of 0.01 N hydrochloric acid, swirl to dissolve, dilute with 0.01 N hydrochloric acid to volume, and mix.

Procedure—Proceed as directed in the Assay under *Oxytetracycline*. Calculate the quantity, in μ g, of oxytetracycline ($C_{22}H_{24}N_2O_9$) in each mg of Oxytetracycline Hydrochloride taken by the formula:

$$200(CP / W)(r_U / r_S)$$

in which the terms are as defined therein.

Oxytetracycline Hydrochloride Capsules

» Oxytetracycline Hydrochloride Capsules contain the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of oxytetracycline ($C_{22}H_{24}N_2O_9$).

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Oxytetracycline RS

Identification—Shake a suitable quantity of Capsule contents with methanol to obtain a solution containing 1 mg of oxytetracycline per mL, and filter. Using the filtrate as the *Test Solution*, proceed as directed for *Method II* under *Identification—Tetracyclines* (193).

Dissolution (711)—

Medium: water; 900 mL.

Apparatus 2: 75 rpm.

Time: 60 minutes.

Procedure—Determine the amount of $C_{22}H_{24}N_2O_9$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 273 nm of filtered portions of the solution under test, suitably diluted with water, in comparison with a Standard solution having a known concentration of USP Oxytetracycline RS in the same medium, using 5 mL of 0.1 N hydrochloric acid to dissolve the Standard.

Tolerances—Not less than 80% (Q) of the labeled amount of $C_{22}H_{24}N_2O_9$ is dissolved in 60 minutes.

Uniformity of dosage units (905): meet the requirements.

Loss on drying (731)—Dry about 100 mg of Capsule contents, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 5.0% of its weight.

Assay—

Tetrabutylammonium hydrogen sulfate solution, Edetate disodium solution, pH 7.5 Phosphate buffer, Mobile phase, Standard preparation, Resolution solution, and Chromatographic system—Proceed as directed in the Assay under *Oxytetracycline*.

Assay preparation—Remove, as completely as possible, the contents of not less than 20 Capsules, and mix. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of oxytetracycline, to a 500-mL volumetric flask, add about 50 mL of 0.01 N hydrochloric acid, and

swirl to dissolve. Dilute with 0.01 N hydrochloric acid to volume, mix, and filter a portion of the solution through a 0.5- μ m or finer porosity filter. Use the filtrate as the Assay preparation.

Procedure—Proceed as directed for *Procedure* in the Assay under Oxytetracycline. Calculate the quantity, in mg, of oxytetracycline ($C_{22}H_{24}N_2O_9$) in the portion of Capsules taken by the formula:

$$0.5(CP)(r_U / r_S)$$

in which the terms are as defined therein.

Oxytetracycline for Injection

» Oxytetracycline for Injection contains an amount of Oxytetracycline Hydrochloride equivalent to not less than 90.0 percent and not more than 115.0 percent of the labeled amount of oxytetracycline ($C_{22}H_{24}N_2O_9$).

Change to read:

Packaging and storage—Preserve as described in *Packaging and Storage Requirements* (659), *Injection Packaging, Packaging for constitution* (CN 1-May-2017), protected from light.

USP Reference standards (11)—

USP Endotoxin RS

USP Oxytetracycline RS

Constituted solution—At the time of use, it meets the requirements for *Injections and Implanted Drug Products* (1), *Specific Tests, Completeness and clarity of solutions*.

Bacterial Endotoxins Test (85)—It contains not more than 0.4 USP Endotoxin Unit per mg of oxytetracycline.

Sterility Tests (71)—It meets the requirements when tested as directed for *Membrane Filtration under Test for Sterility of the Product to be Examined, Fluid D* being used instead of *Fluid A*.

pH (791): between 1.8 and 2.8, in a solution containing 25 mg per mL.

Loss on drying (731)—Dry about 100 mg, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 3.0% of its weight.

Particulate Matter in Injections (788): meets the requirements for small-volume injections.

Other requirements—It responds to *Identification test B* under Oxytetracycline Hydrochloride. It also meets the requirements for *Uniformity of Dosage Units* (905) and *Labeling* (7), *Labels and Labeling for Injectable Products*.

Assay—

Tetrabutylammonium hydrogen sulfate solution, Edetate disodium solution, pH 7.5 Phosphate buffer, Mobile phase, Standard preparation, System suitability solution, and Chromatographic system—Proceed as directed in the Assay under Oxytetracycline.

Assay preparation 1 (where it is represented as being in a single-dose container)—Constitute Oxytetracycline for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and dilute quantitatively with 0.01 N hydrochloric acid to obtain a solution having a concentration of about 0.2 mg of oxytetracycline per mL.

Assay preparation 2 (where the label states the quantity of oxytetracycline in a given volume of constituted solu-

tion)—Constitute Oxytetracycline for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Dilute an accurately measured volume of the constituted solution quantitatively with 0.01 N hydrochloric acid to obtain a solution having a concentration of about 0.2 mg of oxytetracycline per mL.

Procedure—Proceed as directed for *Procedure* in the Assay under Oxytetracycline. Calculate the quantity, in mg, of oxytetracycline ($C_{22}H_{24}N_2O_9$) withdrawn from the container or in the portion of constituted solution taken by the formula:

$$(L / D)(CP)(r_U / r_S)$$

in which *L* is the labeled quantity, in mg, of oxytetracycline ($C_{22}H_{24}N_2O_9$) in the container or in the portion of constituted solution taken; *D* is the concentration, in mg per mL, of oxytetracycline in *Assay preparation 1* or in *Assay preparation 2*, based on the labeled quantity in the container or in the portion of constituted solution taken, respectively, and the extent of dilution; and the other terms are as defined therein.

Oxytetracycline Hydrochloride Soluble Powder

» Oxytetracycline Hydrochloride Soluble Powder is a dry mixture of Oxytetracycline Hydrochloride and one or more suitable excipients. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of oxytetracycline hydrochloride ($C_{22}H_{24}N_2O_9 \cdot HCl$).

Packaging and storage—Preserve in well-closed containers.

Labeling—Label it to indicate that it is for oral veterinary use only.

USP Reference standards (11)—

USP Oxytetracycline RS

Identification—

A: Shake a quantity of Soluble Powder with methanol to obtain a solution containing about 1 mg of oxytetracycline hydrochloride per mL. Filter if necessary to obtain a clear solution. Using the filtrate as the *Test solution*, proceed as directed for *Method II* under *Identification—Tetracyclines* (193).

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the Assay.

pH (791): between 1.5 and 3.0, in the solution obtained as directed in the labeling.

Loss on drying (731)—Dry about 100 mg, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 3.0% of its weight.

Minimum fill (755): meets the requirements.

Assay—

Tetrabutylammonium hydrogen sulfate solution, Edetate disodium solution, pH 7.5 Phosphate buffer, Mobile phase, Standard preparation, System suitability solution, and Chromatographic system—Proceed as directed in the Assay under Oxytetracycline.

Assay preparation—Transfer an accurately weighed portion of the Soluble Powder, equivalent to about 100 mg of oxytetracycline hydrochloride, to a 500-mL volumetric flask, dilute with 0.01 N hydrochloric acid to volume, and mix. Pass a portion of this solution through a filter having a

0.5- μ m or finer porosity. Use the filtrate as the Assay preparation.

Procedure—Proceed as directed for Procedure in the Assay under Oxytetracycline. Calculate the quantity, in g, of oxytetracycline hydrochloride ($C_{22}H_{24}N_2O_9 \cdot HCl$) in each g of Soluble Powder taken by the formula:

$$0.5(496.90 / 460.44)(CP / W)(r_u / r_s)$$

in which 496.90 and 460.44 are the molecular weights of oxytetracycline hydrochloride and oxytetracycline, respectively; C is the concentration, in mg per mL, of USP Oxytetracycline RS in the Standard preparation; P is the assigned potency, in μ g of oxytetracycline per mg, of USP Oxytetracycline RS; W is the weight, in g, of Soluble Powder taken to prepare the Assay preparation; and r_u and r_s are the oxytetracycline peak responses obtained from the Assay preparation and the Standard preparation, respectively.

Oxytetracycline Hydrochloride and Hydrocortisone Acetate Ophthalmic Suspension

» Oxytetracycline Hydrochloride and Hydrocortisone Acetate Ophthalmic Suspension is a sterile suspension of Oxytetracycline Hydrochloride and Hydrocortisone Acetate in a suitable oil vehicle with one or more suitable suspending agents. It contains the equivalent of not less than 90.0 percent and not more than 115.0 percent of the labeled amount of oxytetracycline ($C_{22}H_{24}N_2O_9$) and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hydrocortisone acetate ($C_{23}H_{32}O_6$).

Packaging and storage—Preserve in tight, light-resistant containers. The containers are sealed and tamper-proof so that sterility is assured at time of first use.

USP Reference standards (11)—

USP Hydrocortisone Acetate RS

USP Oxytetracycline RS

Sterility Tests (71)—It meets the requirements when tested as directed for Direct Inoculation of the Culture Medium under Test for Sterility of the Product to be Examined using 0.25 mL of specimen.

Water Determination, Method I (921): not more than 1.0%, 60 mL of a mixture of methanol and chloroform (2:1) being used instead of methanol in the titration vessel.

Assay for oxytetracycline—Transfer an accurately measured volume of Ophthalmic Suspension to a separator, add 50 mL of ether, and shake. Add 25 mL of 0.1 N hydrochloric acid, shake, and allow to separate. Collect the acid layer, and repeat the extraction with three additional 25-mL portions of 0.1 N hydrochloric acid. Combine the acid extracts in a 200-mL volumetric flask, dilute with 0.1 N hydrochloric acid to volume, and mix. Proceed as directed for oxytetracycline under Antibiotics—Microbial Assays (81), using an accurately measured volume of this solution diluted quantitatively and stepwise with water to obtain a Test Dilution having a concentration assumed to be equal to the median dose level of the Standard.

Assay for hydrocortisone acetate—

Mobile phase—Prepare a degassed and filtered mixture of water and methanol (50:50).

Standard preparation—Dissolve an accurately weighed quantity of USP Hydrocortisone Acetate RS in a mixture of

Mobile phase and alcohol (80:20) to obtain a solution having a known concentration of about 0.06 mg per mL.

Assay preparation—Transfer an accurately measured volume of Ophthalmic Suspension, equivalent to about 30 mg of hydrocortisone acetate, to a separator containing 25 mL of pH 9.0 alkaline borate buffer (see under Buffer Solutions in the section Reagents, Indicators, and Solutions). Extract with four 25-mL portions of chloroform, filtering each chloroform extract through a thin layer of chloroform-washed anhydrous sodium sulfate into a 250-mL volumetric flask. Rinse the sodium sulfate with chloroform, collecting the filtrate in the volumetric flask, dilute with chloroform to volume, and mix. Transfer 25.0 mL of the resulting solution to a 50-mL conical flask, and evaporate slowly with the aid of mild heat until about 5 mL remains. Add about 15 mL of alcohol, and evaporate slowly until about 5 mL remains. Transfer this solution to a 50-mL volumetric flask, dilute with a mixture of Mobile phase and alcohol (80:20) to volume, and mix.

Chromatographic system (see Chromatography (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm \times 30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the column efficiency determined from the analyte peak is not less than 235 theoretical plates, the tailing factor for the analyte peak is not more than 1.7, and the relative standard deviation of replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 25 μ L) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{23}H_{32}O_6$ in each mL of the Ophthalmic Suspension taken by the formula:

$$500(C / V)(r_u / r_s)$$

in which C is the concentration, in mg per mL, of USP Hydrocortisone Acetate RS in the Standard preparation; V is the volume, in mL, of Ophthalmic Suspension taken; and r_u and r_s are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.

Oxytetracycline Hydrochloride and Hydrocortisone Ointment

» Oxytetracycline Hydrochloride and Hydrocortisone Ointment contains the equivalent of not less than 90.0 percent and not more than 115.0 percent of the labeled amount of oxytetracycline ($C_{22}H_{24}N_2O_9$), and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hydrocortisone.

Packaging and storage—Preserve in collapsible tubes or in well-closed, light-resistant containers.

USP Reference standards (11)—

USP Hydrocortisone RS

USP Oxytetracycline RS

Minimum fill (755): meets the requirements.

Water Determination, Method I (921): not more than 1.0%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

Assay for oxytetracycline—Transfer a suitable, accurately weighed quantity of Ointment to a separator, add 50 mL of ether, and shake. Add 20 mL of 0.1 N hydrochloric acid, shake, and allow to separate. Collect the acid layer, and repeat the extraction with three additional 20-mL portions

of 0.1 N hydrochloric acid. Combine the acid extracts in a 100-mL volumetric flask, dilute with 0.1 N hydrochloric acid to volume, and mix. Quantitatively dilute a portion of this solution with 0.1 N hydrochloric acid so that the solution so obtained contains not less than 150 µg of oxytetracycline per mL. Proceed as directed for oxytetracycline under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of this solution diluted quantitatively and stepwise with water to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

Assay for hydrocortisone—Proceed with Ointment as directed in the *Assay for hydrocortisone* under *Neomycin and Polymyxin B Sulfates, Bacitracin Zinc, and Hydrocortisone Ophthalmic Ointment*.

Oxytetracycline Hydrochloride and Polymyxin B Sulfate Ointment

» Oxytetracycline Hydrochloride and Polymyxin B Sulfate Ointment contains the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of oxytetracycline ($C_{22}H_{24}N_2O_9$), and not less than 90.0 percent and not more than 125.0 percent of the labeled amount of polymyxin B.

Packaging and storage—Preserve in collapsible tubes, or in well-closed, light-resistant containers.

USP Reference standards (11)—

USP Oxytetracycline RS
USP Polymyxin B Sulfate RS

Minimum fill (755): meets the requirements.

Water Determination, Method I (921): not more than 1.0%, 10 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

Assay for oxytetracycline—Proceed with Ointment as directed in the *Assay for oxytetracycline* under *Oxytetracycline Hydrochloride and Hydrocortisone Ointment*.

Change to read:

Assay for polymyxin B—Transfer an accurately weighed quantity of Ointment, equivalent to about 10,000 USP Polymyxin B Units, to a 15-mL centrifuge tube, add 10 mL of ether, stir, and centrifuge for 10 minutes. Decant and discard the clear ether. Wash the residue with 10 mL of ether, centrifuge for 10 minutes, decanting and discarding the clear ether. Wash the residue with several 10-mL portions of acetone, centrifuging, decanting, and discarding each washing until the yellow color is removed from the residue. [NOTE—Take care not to remove any of the residue with the washings.] Add 0.2 mL of polysorbate 80 to the residue, and mix. Transfer the mixture to a 100-mL volumetric flask with the aid of *Buffer B.6* (CN 1-May-2017), dilute with the same solvent to volume, and mix. Proceed as directed for polymyxin B under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of this solution diluted quantitatively with *Buffer B.6* (CN 1-May-2017) to yield a *Test Dilution* having a concentration of polymyxin B assumed to be equal to the median dose level of the Standard.

Oxytetracycline Hydrochloride and Polymyxin B Sulfate Ophthalmic Ointment

DEFINITION

Oxytetracycline Hydrochloride and Polymyxin B Sulfate Ophthalmic Ointment is a sterile ointment containing Oxytetracycline Hydrochloride and Polymyxin B Sulfate. It contains the equivalent of NLT 90.0% and NMT 120.0% of the labeled amount of oxytetracycline and NLT 90.0% and NMT 125.0% of the labeled amount of polymyxin B.

ASSAY

• OXYTETRACYCLINE

(See *Antibiotics—Microbial Assays* (81).)

Sample solution: Transfer a suitable, weighed quantity of the Ophthalmic Ointment to a separator, add 50 mL of ether, and shake. Add 20 mL of 0.1 N hydrochloric acid, shake, and allow to separate. Collect the acid layer, and repeat the extraction with three additional 20-mL portions of 0.1 N hydrochloric acid. Combine the acid extracts in a 100-mL volumetric flask, and dilute with 0.1 N hydrochloric acid to volume. Dilute a portion of this solution with 0.1 N hydrochloric acid to obtain a solution containing NLT 150 µg/mL of oxytetracycline.

Analysis: Proceed as directed in the chapter, using a suitable aliquot of the *Sample solution* diluted with water, to yield a *Test Dilution* having an oxytetracycline concentration that is nominally equivalent to the median level of the standard.

Acceptance criteria: 90.0%–120.0%

• POLYMYXIN B

(See *Antibiotics—Microbial Assays* (81).)

Sample solution: Transfer nominally 10,000 USP Polymyxin B Units from the Ophthalmic Ointment to a 15-mL centrifuge tube. Add 10 mL of ether, stir, and centrifuge for 10 min. Decant, and discard the clear ether. Wash the residue with 10 mL of ether, and centrifuge for 10 min, decanting and discarding the clear ether. Wash the residue with several 10-mL portions of acetone, centrifuging, decanting, and discarding each washing until the yellow color is removed from the residue. Take care not to remove any of the residue with the washings. Add 0.2 mL of polysorbate 80 to the residue, and mix. Transfer the mixture to a 100-mL volumetric flask with the aid of *Buffer B.6*, and dilute with the same solvent to volume.

Analysis: Proceed as directed in the chapter, using a suitable aliquot of the *Sample solution* diluted with *Buffer B.6*, to yield a *Test Dilution* having a polymyxin B concentration that is nominally equivalent to the median level of the standard.

Acceptance criteria: 90.0%–125.0%

SPECIFIC TESTS

- **STERILITY TESTS** (71): Meets the requirements
- **OTHER REQUIREMENTS:** It meets the requirements in *Ophthalmic Products—Quality Tests* (771).

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in collapsible ophthalmic ointment tubes. Store at controlled room temperature.

• **USP REFERENCE STANDARDS** (11)

USP Oxytetracycline RS
USP Polymyxin B Sulfate RS

Oxytetracycline Hydrochloride and Polymyxin B Sulfate Topical Powder

» Oxytetracycline Hydrochloride and Polymyxin B Sulfate Topical Powder contains the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amounts of oxytetracycline ($C_{22}H_{24}N_2O_9$) and polymyxin B in a suitable, fine powder base.

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Oxytetracycline RS
USP Polymyxin B Sulfate RS

Minimum fill (755): meets the requirements.

Loss on drying (731)—Dry about 100 mg, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 2.0% of its weight.

Assay for oxytetracycline—Transfer a suitable, accurately weighed quantity of Topical Powder to a glass blender jar containing a sufficient, accurately measured volume of 0.1 N hydrochloric acid to yield a stock solution containing not less than 150 µg of oxytetracycline per mL, and blend at high speed for 3 to 5 minutes. Proceed as directed for oxytetracycline under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of this solution diluted quantitatively and stepwise with water to obtain a *Test Dilution* having a concentration of oxytetracycline assumed to be equal to the median dose level of the Standard.

Change to read:

Assay for polymyxin B—Transfer an accurately weighed quantity of Topical Powder, equivalent to about 10,000 USP Polymyxin B Units, to a 50-mL centrifuge tube, add 15 mL of acetone and 0.05 mL of hydrochloric acid, and stir. Add 20 mL of acetone, and centrifuge for 10 minutes. Decant and discard the clear liquid. Add 15 mL of acetone and 0.05 mL of hydrochloric acid to the residue, stir, add 20 mL of acetone, and centrifuge for 10 minutes, decanting and discarding the clear liquid. [NOTE—Take care not to discard any of the residue with the clear liquid.] Add 5 mL of *Buffer B.6* (CN 1-May-2017) to the residue, and mix. Transfer the mixture to a 100-mL volumetric flask with the aid of *Buffer B.6* (CN 1-May-2017), dilute with the same solvent to volume, and mix. Proceed as directed for polymyxin B under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of this stock solution diluted quantitatively with *Buffer B.6* (CN 1-May-2017) to obtain a *Test Dilution* having a concentration of polymyxin B assumed to be equal to the median dose level of the Standard.

Oxytetracycline Hydrochloride and Polymyxin B Sulfate Vaginal Inserts

» Oxytetracycline Hydrochloride and Polymyxin B Sulfate Vaginal Inserts contain the equivalent of

not less than 90.0 percent and not more than 120.0 percent of the labeled amounts of oxytetracycline ($C_{22}H_{24}N_2O_9$) and polymyxin B.

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Oxytetracycline RS
USP Polymyxin B Sulfate RS

Loss on drying (731)—Dry about 100 mg, accurately weighed, of powdered Vaginal Inserts in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 3.0% of its weight.

Assay for oxytetracycline—Place not fewer than 5 Vaginal Inserts in a high-speed blender jar containing an accurately measured volume of 0.1 N hydrochloric acid, so that the stock solution obtained after blending for 3 to 5 minutes contains not less than 150 µg of oxytetracycline per mL. Proceed as directed for oxytetracycline under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of this solution diluted quantitatively and stepwise with water to obtain a *Test Dilution* having a concentration of oxytetracycline assumed to be equal to the median dose level of the Standard.

Change to read:

Assay for polymyxin B—Weigh and finely powder not fewer than 5 Vaginal Inserts. Transfer an accurately weighed portion of the powder, equivalent to about 100,000 USP Polymyxin B Units, to a filter funnel equipped with a solvent-resistant membrane filter (1-µm or finer porosity). Wash the powder with five 20-mL portions of acetone, applying vacuum, and discarding the accumulated filtrate. [NOTE—If necessary, wash the powder with additional portions of acetone to remove any yellow color.] Carefully transfer the filter and the washed powder to a beaker containing about 400 mL of *Buffer B.6* (see *Antibiotics—Microbial Assays* (81), *Media and Solutions, Solutions, Buffers*), (CN 1-May-2017) and stir. Transfer the contents of the beaker to a 500-mL volumetric flask with the aid of *Buffer B.6* (CN 1-May-2017), dilute with the same solvent to volume, and mix. Proceed as directed for polymyxin B under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of this solution diluted quantitatively and stepwise with *Buffer B.6* (CN 1-May-2017) to yield a *Test Dilution* having a concentration of polymyxin B assumed to be equal to the median dose level of the Standard.

Oxytocin

1007.19

Oxytocin.

Oxytocin [50-56-6].

» Oxytocin is a nonapeptide hormone having the property of causing the contraction of uterine smooth muscle and of the myoepithelial cells within the mammary gland. It is prepared by synthesis. Its oxytocic activity is not less than 400 USP Oxytocin Units per mg.

Packaging and storage—Preserve in tight containers, preferably of Type I glass, in a refrigerator.

USP Reference standards (11)—

USP Oxytocin RS

USP Oxytocin Identification RS

Microbial enumeration tests (61) and **Tests for specified microorganisms** (62)—The total bacterial count does not exceed 200 cfu per g. For products of animal origin, it meets also the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

Identification—

A: The retention time of the oxytocin peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation* as obtained in the *Assay*.

Perform one of the following two tests:

B: Nuclear Magnetic Resonance—[NOTE—Concentrations of Oxytocin in both the *Standard solution* and the *Test solution* must be the same (within 5% of each other) but can be adjusted based on the quality of the spectrum obtained. The spectra must be acquired under the same conditions for both the *Standard solution* and the *Test solution*. The spectra obtained are of sufficient quality to allow quantification of the integrals of the resonances specified below to be obtained. Integrals and spectra of both the *Standard solution* and the *Test solution* can be repeated and averaged.]

pH 5.0 Sodium phosphate buffer—Dissolve 27.6 g of monobasic sodium phosphate in 900 mL of water, adjust with phosphoric acid or 10 N sodium hydroxide to a pH of 5.0 ± 0.1, dilute with water to 1000 mL, and mix.

Standard solution—Prepare a 10 mg per mL solution (approximately 1 mL) of USP Oxytocin Identification RS in pH 5.0 Sodium phosphate buffer. Lyophilize to dryness, redissolve in deuterium oxide, lyophilize again, redissolve in deuterium oxide, and lyophilize once again (to replace exchangeable hydrogens with deuterium). Dissolve in 1 mL of deuterium oxide containing 0.5% v/v (2,2,3,3-d₄)-3-(trimethylsilyl) propionic acid sodium salt (TSP) as a chemical shift reference.

Test solution—Prepare a 10 mg per mL solution (approximately 1 mL) of Oxytocin in pH 5.0 Sodium phosphate buffer. Proceed as directed for the *Standard solution*.

Procedure—Obtain a proton NMR spectrum of both the *Standard solution* and the *Test solution*. The spectra from both solutions are qualitatively and quantitatively similar, and all the resonances from the spectrum of the *Standard solution* are present in the spectrum of the *Test solution* and have the same chemical shift values (±0.1 ppm). Identify any other resonances in the spectrum of the *Test solution* that are not present in the spectrum of the *Standard solution*. The integrals of the acetate and deuterium oxide peaks at 1.9 ppm and 4.9 ppm can differ quantitatively in the spectra of the *Standard solution* and the *Test solution*.

C: Amino acid content—Use a suitable, validated procedure (see *Biotechnology-Derived Articles—Amino Acid Analysis* (1052)).

Standard solutions—Prepare a solution having known equimolar amounts of L-alanine, L-arginine, L-aspartic acid, L-glutamic acid, glycine, L-histidine, L-isoleucine, L-leucine, L-lysine, L-methionine, L-phenylalanine, L-proline, L-serine, L-threonine, L-tyrosine, and L-valine with half the equimolar amount of L-cystine. For the validation of the method, use an appropriate internal standard, such as norleucine. Prepare a separate, equimolar solution of L-tryptophan.

Test solution—[NOTE—The following hydrolysis conditions and concentrations can be modified depending on the method of analysis chosen.] Transfer about 64 mg of Oxytocin, accurately weighed, to a suitable vessel, and dissolve in 1.0 mL of water. Transfer 0.10 mL of this solution to a vacuum hydrolysis tube, add 2.0 mL of 6 N hydrochloric acid, evacuate the tube, and heat for 16 hours at 120°. Transfer 0.10 mL of the hydrolysate so obtained to a suitable vessel, add 1 mL of water, and lyophilize. Dissolve in and dilute to

a suitable volume in a buffer solution suitable for amino acid analysis.

Procedure—Inject equal volumes of the *Standard solutions* and the *Test solution* into the amino acid analyzer, and measure and record the responses for each amino acid peak. Express the content of each amino acid in moles. Calculate the relative proportions of the amino acids, taking 1/6 of the sum of the number of moles of aspartic acid, glutamic acid, proline, glycine, isoleucine, and leucine as equal to 1. The values fall within the following limits: aspartic acid: 0.90 to 1.10; glutamic acid: 0.90 to 1.10; proline: 0.90 to 1.10; glycine: 0.90 to 1.10; leucine: 0.90 to 1.10; isoleucine: 0.90 to 1.10; tyrosine: 0.7 to 1.05; half-cystine: 1.4 to 2.1. Not more than traces of other amino acids are present.

Acetic acid content (503): between 6% and 10%.

Test Solution—Transfer about 15 mg of Oxytocin, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Ordinary impurities—The sum of the responses of impurities in the chromatogram of the *Assay preparation* obtained in the *Assay* is not more than 5% of the area of the oxytocin peak.

Assay—

Mobile phase A—Prepare a buffer solution of 0.1 M monobasic sodium phosphate.

Mobile phase B—Prepare a filtered and degassed mixture of acetonitrile in water (1:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Diluent—Dissolve 5.0 g of chlorobutanol in 5.0 mL of glacial acetic acid, add 5.0 g of alcohol, 1.1 g of sodium acetate, and 1000 mL of water, and mix.

Standard preparation—Dissolve the entire contents of a vial of USP Oxytocin RS in a known volume of *Diluent*.

[NOTE—The solution may be diluted as necessary to a working concentration range for the assay.]

Assay preparation—Dissolve an accurately weighed quantity of Oxytocin in *Diluent* to obtain a solution containing about 10 USP Oxytocin Units per mL.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a variable wavelength detector set at 220 nm and a 12.0-cm × 4.6-mm column that contains 5-μm packing L1, and is programmed to provide variable mixtures of *Mobile phase A* and *Mobile phase B*. The column is maintained at room temperature, and the flow rate is about 1.5 mL per minute. The system is equilibrated with a mixture of 70% *Mobile phase A* and 30% *Mobile phase B*. After each injection of the *Standard preparation* and the *Assay preparation*, the composition of the mobile phase is changed linearly over the next 20 minutes so that it consists of a mixture of 50% *Mobile phase A* and 50% *Mobile phase B*. Chromatograph the *Standard preparation*, and record the chromatograms as directed for *Procedure*. Adjust the flow rate or the composition of the *Mobile phase* such that the retention time of oxytocin is approximately 10 minutes and between 15 and 17 minutes for chlorobutanol. The resolution, *R*, between oxytocin and the nearest adjacent peak is not less than 1.5, and the relative standard deviation for replicate injections is not more than 2.0% for oxytocin.

Procedure—Separately inject three equal volumes (about 100 μL) of the *Assay preparation* and the *Standard preparation* into the chromatograph, and record the chromatograms as described under *Chromatographic system*. Identify the peaks, and determine the area of the oxytocin peak. Calculate the potency of oxytocin in USP Oxytocin Units per mg by the formula:

$$C(r_u/r_s)(V/W)$$

in which *C* is the concentration, in USP Oxytocin Units per mL, of the *Standard preparation*; and *r_u* and *r_s* are the mean

peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively; V is the volume of sample solution in which the sample was dissolved; and W is the amount, in mg, of oxytocin dissolved in the sample solution.

Oxytocin Injection

» Oxytocin Injection is a sterile solution of Oxytocin in a suitable diluent. Each mL of Oxytocin Injection possesses an oxytocic activity of not less than 90.0 percent and not more than 110.0 percent of that stated on the label in USP Oxytocin Units.

Packaging and storage—Preserve in single-dose or multiple-dose containers, preferably of Type I glass or in suitable plastic containers.

Labeling—Label it to indicate its oxytocic activity in USP Oxytocin Units per mL. Label it also to state the animal source if naturally derived, or to state that it is synthetic.

USP Reference standards (11)—

USP Endotoxin RS

USP Oxytocin RS

Bacterial Endotoxins Test (85)—It contains not more than 35.7 Endotoxin Units per USP Oxytocin Unit.

pH (791): between 3.0 and 5.0.

Particulate Matter in Injections (788): meets the requirements for small-volume injections.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—Proceed as directed for Oxytocin except to use undiluted Injection as the *Assay preparation* and to allow not less than 25 minutes between injections. Calculate the potency, in USP Oxytocin Units per mL, by the formula:

$$C(r_u / r_s)$$

in which C is the concentration, in USP Oxytocin Units per mL, of the *Standard preparation*; and r_u and r_s are the mean values of the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Paclitaxel

$C_{47}H_{51}NO_{14}$ 853.91

Benzenepropanoic acid, β -(benzoylamino)- α -hydroxy-, 6,12-bis(acetyloxy)-12-(benzoyloxy)-2a,3,4,4a,5,6,9,10,11,12,12a,12b-dodecahydro-4,11-dihydroxy-4a,8,13,13-tetramethyl-5-oxo-7,11-methano-1H-cyclodeca[3,4]benz[1,2-b]oxet-9-yl ester, [2aR-[2a α ,4 β ,4a β ,6 β ,9 α (α R*, β S*),11 α ,12 α ,12a α ,12b α]]-, (2aR,4S,4aS,6R,9S,11S,12S,12aR,12bS)-1,2a,3,4,4a,6,9,10,11,12,12a,12b-Dodecahydro-4,6,9,11,12,12b-hexahydroxy-4a,8,13,13-tetramethyl-7,11-methano-5H-cyclodeca[3,4]-benz[1,2-b]oxet-5-one 6,12b-diacetate, 12-benzoate, 9-ester with (2R,3S)-N-benzoyl-3-phenylisoserine [33069-62-4].

» Paclitaxel contains not less than 97.0 percent and not more than 102.0 percent of $C_{47}H_{51}NO_{14}$, calculated on the anhydrous, solvent-free basis.

Caution—Paclitaxel is cytotoxic. Great care should be taken to prevent inhaling particles of Paclitaxel and exposing the skin to it.

Packaging and storage—Preserve in tight, light-resistant containers, and store at controlled room temperature.

Labeling—The labeling indicates the type of process used to produce the material and the *Related compounds* test with which the material complies.

USP Reference standards (11)—

USP Endotoxin RS

USP Paclitaxel RS

USP Paclitaxel Related Compound A RS

Cephalomannine.

USP Paclitaxel Related Compound B RS

10-Deacetyl-7-epipaclitaxel.

USP Paclitaxel Impurity Mixture RS

Mixture of paclitaxel and the following related compounds: propyl analog, cephalomannine, *sec*-butyl analog, *n*-butyl analog, benzyl analog, baccatin VI, pentyl analog, and 7-epipaclitaxel.

Identification—

A: *Infrared Absorption* (197K).

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Specific rotation (781S): between -49.0° and -55.0° at 20° , calculated on the anhydrous, solvent-free basis.

Test solution: 10 mg per mL, in methanol.

Microbial enumeration tests (61) and Tests for specified microorganisms (62)—The total aerobic microbial count does not exceed 100 cfu per g. It meets the requirements of the tests for the absence of *Staphylococcus aureus*, *Pseudomonas aeruginosa*, *Salmonella* species, and *Escherichia coli*.

Bacterial Endotoxins Test (85)—It contains not more than 0.4 USP Endotoxin Unit per mg of paclitaxel.

Water Determination, Method 1c (921): not more than 4.0%.

Residue on ignition (281): not more than 0.2%.

Delete the following:

• **Heavy metals, Method II** (231): 0.002%. • (Official 1-Jan-2018)

Related compounds—

TEST 1 (FOR MATERIAL LABELED AS ISOLATED FROM NATURAL SOURCES)—If the material complies with this test, the labeling indicates that it meets USP *Related compounds Test 1*.

Diluent—Prepare as directed in the *Assay*.

Solution A—Prepare filtered and degassed acetonitrile.

Solution B—Prepare filtered and degassed water.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

System suitability solution—Dissolve accurately weighed quantities of USP Paclitaxel Related Compound A RS and USP Paclitaxel Related Compound B RS in methanol to obtain a solution having known concentrations of about 10 μ g of each per mL. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Standard solution—Dissolve, with the aid of sonication, an accurately weighed quantity of USP Paclitaxel RS in *Diluent*, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 5 μ g per mL.

Test solution—Use the *Assay preparation*.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 227-nm detector and a 4.6-mm \times 25-cm column that contains 5- μ m packing L43. The flow rate is about 2.6 mL per minute. The column temperature is maintained at 30° . The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–35	35	65	isocratic
35–60	35→80	65→20	linear gradient
60–70	80→35	20→65	linear gradient
70–80	35	65	isocratic

Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.78 for paclitaxel related compound A and 0.86 for paclitaxel related compound B (relative to the retention time for paclitaxel obtained from the *Test solution*); and the resolution, *R*, between paclitaxel related compound A and paclitaxel related compound B is not less than 1.0. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Inject a volume (about 15 μ L) of the *Test solution* into the chromatograph, record the chromatogram, and measure the areas for the major peaks. Calculate the percentage of each impurity in the portion of Paclitaxel taken by the formula:

$$100(F_i / r_u)$$

in which *F* is the relative response factor for each impurity peak (see *Table 1* for values); *r_i* is the peak area for each individual impurity; and *r_u* is the peak area for paclitaxel.

Table 1

Relative Retention Time	Relative Response Factor (F)	Name	Limit (%)
0.24	1.29	Baccatin III	0.2
0.53	1.00	10-Deacetylpaclitaxel	0.5
0.57	1.00	7-Xylosylpaclitaxel	0.2
0.78	1.26	Cephalomannine (paclitaxel related compound A)	a ₁ ¹
0.78	1.26	2'',3''-Dihydrocephalomanine	a ₂ ¹
0.86	1.00	10-Deacetyl-7-epipaclitaxel (paclitaxel related compound B)	0.5
1.10	1.00	Benzyl analog ³	b ₁ ²
1.10	1.00	3'',4''-Dehydropaclitaxel C	b ₂ ²
1.40	1.00	7-Epicephalomannine	0.3
1.85	1.00	7-Epipaclitaxel	0.5

¹ Resolution may be incomplete for these peaks, depending upon the relative amounts present; the sum of a₁ and a₂ is not more than 0.5%.

² Resolution may be incomplete for these peaks, depending upon the relative amounts present; the sum of b₁ and b₂ is not more than 0.5%.

³ The following chemical name is assigned to the related compound, benzyl analog: Baccatin III 13-ester with (2*R*,3*S*)-2-hydroxy-3-phenyl-3-(2-phenylacetylaminopropanoic acid.

In addition to not exceeding the limits for paclitaxel related impurities in Table 1, not more than 0.1% of any other single impurity is found; and not more than 2.0% of total impurities is found.

TEST 2 (FOR MATERIAL LABELED AS PRODUCED BY A SEMISYNTHETIC PROCESS)—If the material complies with this test, the labeling indicates that it meets USP *Related compounds* Test 2.

Diluent—Use acetonitrile.

Solution A—Use a filtered and degassed mixture of water and acetonitrile (3:2).

Solution B—Use filtered and degassed acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

System suitability solution—Dissolve accurately weighed quantities of USP Paclitaxel RS and USP Paclitaxel Related Compound B RS in *Diluent*, shaking and sonicating if necessary, to obtain a solution having known concentrations of about 0.96 mg and 0.008 mg per mL, respectively.

Test solution—Transfer about 10 mg of Paclitaxel, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, shaking and sonicating if necessary, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 227-nm detector and a 4.6-mm × 15-cm column that contains 3-μm packing L1. The flow rate is about 1.2 mL per minute. The column temperature is maintained at 35°. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–20	100	0	isocratic
20–60	100→10	0→90	linear gradient
60–62	10→100	90→0	linear gradient
62–70	100	0	isocratic

Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.94 for paclitaxel related compound B and 1.0 for paclitaxel; the resolution, *R*, between paclitaxel related compound B and paclitaxel is not less than

1.2; and the relative standard deviation for replicate injections is not more than 2.0% for the paclitaxel peak.

Procedure—Separately inject equal volumes (about 15 μL) of the *Diluent* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for all the peaks. Disregard any peaks due to the *Diluent*. Calculate the percentage of each impurity in the portion of Paclitaxel taken by the formula:

$$100(F_i / r_s)$$

in which *F* is the relative response factor for each impurity (see Table 2 for values); *r_i* is the peak area for each impurity obtained from the *Test solution*; and *r_s* is the sum of the areas of all the peaks obtained from the *Test solution*.

Table 2

Relative Retention Time	Relative Response Factor (F)	Name	Limit (%)
0.11	1.24	10-Deacetylbaaccatin III	0.1
0.20	1.29	Baccatin III	0.2
0.42	1.39	Photodegradant ²	0.1
0.47	1.00	10-Deacetylpaclitaxel	0.5
0.80	1.00	2-Debenzoypaclitaxel-2-pentenoate	0.7
0.92 ¹	1.00	Oxetane ring opened, acetyl and benzoyl migrated ²	x ₁
0.92 ¹	1.00	10-Acetoacetylpaclitaxel	x ₂
0.94 ¹	1.00	10-Deacetyl-7-epipaclitaxel (paclitaxel related compound B)	x ₃
1.37	1.00	7-Epipaclitaxel	0.4
1.45	1.00	10,13-Bissidechainpaclitaxel ²	0.5
1.54	1.00	7-Acetylpaclitaxel	0.6
1.80	1.75	13-Tes-baccatin III	0.1
2.14	1.00	7-Tes-paclitaxel	0.3

¹ Resolution may be incomplete for these peaks, depending upon the relative amounts present; the sum of x₁, x₂, and x₃ is not more than 0.4%.

² The following chemical names are assigned to the related compounds Photodegradant; Oxetane ring opened, acetyl and benzoyl migrated; and 10,13-Bissidechainpaclitaxel:

Photodegradant
(1*R*,2*R*,4*S*,5*S*,7*R*,10*S*,11*R*,12*S*,13*S*,15*S*,16*S*)-2,10-diacetyloxy-5,13-dihydroxy-4,16,17,17-tetramethyl-8-oxa-3-oxo-12-phenylcarbonyloxypentacyclo[11.3.1.0^{1,11}.0^{4,11}.0^{7,10}]heptadec-15-yl(2*R*,3*S*)-2-hydroxy-3-phenyl-3-(phenylcarbonylamino)propanoate
Oxetane ring opened, acetyl and benzoyl migrated
(1*S*,2*S*,3*R*,4*S*,5*S*,7*S*,8*S*,10*R*,13*S*)-5,10-diacetyloxy-1,2,4,7-tetrahydroxy-8,12,15,15-tetramethyl-9-oxo-4-(phenylcarbonyloxymethyl)tricyclo[9.3.1.0^{3,8}]pentadec-11-en-13-yl(2*R*,3*S*)-2-hydroxy-3-phenyl-3-(phenylcarbonylamino)propanoate
10,13-Bissidechainpaclitaxel
Baccatin III 13-ester with (2*R*,3*S*)-2-hydroxy-3-phenyl-3-(phenylcarbonylamino)propanoic acid, 10-ester with (2*S*,3*S*)-2-hydroxy-3-phenyl-3-(phenylcarbonylamino)propanoic acid

In addition to not exceeding the limits for paclitaxel related impurities in Table 2, not more than 0.1% of any other single impurity is found; and not more than 2.0% of total impurities is found.

TEST 3 (FOR MATERIAL LABELED AS PRODUCED BY A PLANT CELL FERMENTATION PROCESS)—If the material complies with this test, the labeling indicates that it meets USP *Related compounds* Test 3.

Solution A—Prepare a filtered and degassed mixture of water and acetonitrile (3:2).

Solution B—Prepare filtered and degassed acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

System suitability solution—Dissolve USP Paclitaxel Impurity Mixture RS in acetonitrile, sonicating if necessary, to obtain a solution having a known concentration of about 1 mg per mL.

Standard solution—Dissolve an accurately weighed quantity of USP Paclitaxel RS in acetonitrile, sonicating if necessary, to obtain a solution having a known concentration of about 1 mg per mL.

Test solution—Transfer about 10 mg of Paclitaxel, accurately weighed, to a 10-mL volumetric flask. Dissolve in and dilute with acetonitrile to volume, sonicating if necessary, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 227-nm detector and a 4.6-mm × 15-cm column that contains 3-μm packing L1. The flow rate is about 1.2 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–28	100	0	isocratic
28–33	100→98	0→2	linear gradient
33–58	98→10	2→90	linear gradient
58–60	10	90	isocratic
60–63	10→100	90→0	linear gradient
63–70	100	0	isocratic

Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution, R , between paclitaxel and benzyl analog is not less than 1.8. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%. [NOTE—For the purpose of peak identification, the approximate relative retention times are given in *Table 3*. The relative retention times are measured versus Paclitaxel.]

Table 3

Name	Relative Retention Time	Limit (%)
Propyl analog ¹	0.54	0.2
Cephalomannine (Paclitaxel related compound A)	0.76	0.5
sec-Butyl analog ²	0.81	0.2
n-Butyl analog ³	0.89	0.1
Benzyl analog	1.10	0.4
Baccatin VI	1.23	0.2
Pentyl analog ⁴	1.31	0.2
7-Epipaclitaxel	1.51	0.4

¹ The following chemical name is assigned to the related compound Propyl analog: Baccatin III 13-ester with (2*R*,3*S*)-3-butanoylamino-2-hydroxy-3-phenylpropanoic acid.

² The following chemical name is assigned to the related compound sec-Butyl analog: Baccatin III 13-ester with (2*R*,3*S*)-2-hydroxy-3-(2-methylbutanoylamino)-3-phenylpropanoic acid.

³ The following chemical name is assigned to the related compound n-Butyl analog: Baccatin III 13-ester with (2*R*,3*S*)-2-hydroxy-3-(pentanoylamino)-3-phenylpropanoic acid.

⁴ The following chemical name is assigned to the related compound Pentyl analog: Baccatin III 13-ester with (2*R*,3*S*)-3-(hexanoylamino)-2-hydroxy-3-phenylpropanoic acid.

Procedure—Inject a volume (about 12 μL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the areas for all the peaks. Calculate the per-

centage of each impurity in the portion of Paclitaxel taken by the formula:

$$100(r_i / r_U)$$

in which r_i is the response of each individual impurity; and r_U is the sum of the areas of all the peaks obtained from the *Test solution*. In addition to not exceeding the limits for paclitaxel related impurities in *Table 3*, not more than 0.1% of any other single impurity is found; and not more than 2.0% of total impurities is found.

Assay—

Diluent—Prepare a mixture of methanol and acetic acid (200:1).

Mobile phase—Prepare a filtered and degassed mixture of water and acetonitrile (11:9). Make adjustments if necessary (see *System Suitability under Chromatography* (621)).

Standard preparation—Dissolve, using sonication if necessary, an accurately weighed quantity of USP Paclitaxel RS in *Diluent*, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 1 mg per mL.

Assay preparation—Transfer about 10 mg of Paclitaxel, accurately weighed, to a 10-mL volumetric flask. Dissolve in *Diluent*, using sonication if necessary, dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 227-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L43. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is between 0.7 and 1.3; and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 10 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of $C_{47}H_{51}NO_{14}$ in the portion of Paclitaxel taken by the formula:

$$10C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Paclitaxel RS in the *Standard preparation*; and r_U and r_S are the peak responses for paclitaxel obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Paclitaxel Injection

» Paclitaxel Injection is a sterile, stabilized solution of Paclitaxel, suitable for dilution for intravenous administration. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of paclitaxel ($C_{47}H_{51}NO_{14}$).

Packaging and storage—Preserve in single-dose or multiple-dose containers, preferably of Type I glass, at controlled room temperature.

Labeling—Label it to indicate that it is to be diluted with a suitable parenteral vehicle prior to intravenous infusion.

USP Reference standards (11)—

USP Endotoxin RS

USP Paclitaxel RS

USP Paclitaxel Related Compound B RS

10-Deacetyl-7-epipaclitaxel.

Identification—

A: The retention time of the major peak in the chromatogram of the *Test solution* corresponds to that in the chromatogram of the *Standard solution*, as obtained in the test for *Limit of degradation products*.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Bacterial Endotoxins Test (85)—It contains not more than 0.67 USP Endotoxin Unit per mg of paclitaxel.

pH (791): between 3.0 and 7.0, in a solution (1 in 10).

Limit of degradation products—

Solution A—Prepare a filtered and degassed mixture of water and acetonitrile (3:2).

Solution B—Use filtered and degassed acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard solution—Dissolve accurately weighed quantities of USP Paclitaxel RS and USP Paclitaxel Related Compound B RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, to obtain solutions having known concentrations of about 1.2 mg per mL and 0.006 mg per mL, respectively.

Test solution—Quantitatively dilute an accurately measured volume of *Injection* with acetonitrile to obtain a solution containing about 1.2 mg of paclitaxel per mL, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 227-nm detector and a 4.6-mm × 15-cm column that contains 3-μm packing L1. The flow rate is about 1.2 mL per minute. The column temperature is maintained at 35°. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–26	100	0	isocratic
26–66	100→17	0→83	linear gradient
66–67	17→100	83→0	linear gradient
67–75	100	0	isocratic

Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the resolution, R , between paclitaxel related compound B and paclitaxel is not less than 1.2; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas of the analyte peaks. Calculate the percentage of each degradation product in the volume of *Injection* taken by the formula:

$$100(C_S / C_U)(r_i / r_S)$$

in which C_S is the concentration, in mg per mL, of USP Paclitaxel Related Compound B RS in the *Standard solution*; C_U is the concentration, in mg per mL, of paclitaxel in the *Test solution*, based on the labeled amount of paclitaxel per mL of *Injection*; r_i is the peak area for each degradation product obtained from the *Test solution*; and r_S is the peak area for paclitaxel related compound B obtained from the *Standard solution*. In addition to not exceeding the limits stated in *Table 1*, not more than 0.1% of any other paclitaxel degradation product is found; and not more than 2.0% of total paclitaxel degradation products is found.

Table 1

Relative Retention Time	Name	Limit (%)
0.19	Baccatin III	0.8
0.21	Ethyl ester side chain	0.4
0.50	10-Deacetylpaclitaxel	0.8
0.95	10-Deacetyl-7-epipaclitaxel (paclitaxel related compound B)	0.5
1.40	7-Epipaclitaxel	0.6

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—

Diluent—Transfer 200 μL of glacial acetic acid to a 1-liter volumetric flask containing about 500 mL of methanol, mix, and dilute with methanol to volume.

Mobile phase—Prepare a filtered and degassed mixture of water and acetonitrile (11:9). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Dissolve an accurately weighed quantity of USP Paclitaxel RS in *Diluent* to obtain a solution having a known concentration of about 0.6 mg per mL.

Assay preparation—Quantitatively dilute an accurately measured volume of *Injection* with *Diluent* to obtain a solution containing about 0.6 mg of paclitaxel per mL.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 227-nm detector and a 4.0-mm × 25-cm column that contains 5-μm packing L43. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the retention time of the paclitaxel peak is between 6.0 and 10.0 minutes; and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 10 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the paclitaxel peaks. Calculate the quantity, in mg, of paclitaxel ($C_{47}H_{51}NO_{14}$) in each mL of the *Injection* taken by the formula:

$$(L/D)C(r_U / r_S)$$

in which L is the labeled quantity, in mg, of paclitaxel in each mL of *Injection*; D is the concentration, in mg per mL, of paclitaxel in the *Assay preparation*, based on the labeled quantity; C is the concentration, in mg per mL, of USP Paclitaxel RS in the *Standard preparation*; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Padimate O

$C_{17}H_{27}NO_2$ 277.40
Benzoic acid, 4-(dimethylamino)-, 2-ethylhexyl ester;
2-Ethylhexyl *p*-(dimethylamino)benzoate [21245-02-3].

DEFINITION

Padimate O contains NLT 97.0% and NMT 102.0% of padimate O ($C_{17}H_{27}NO_2$).

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197F)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **PROCEDURE**

Mobile phase: Methanol, water, and glacial acetic acid (850:150:0.5)

Standard solution: 0.1 mg/mL of USP Padimate O RS in methanol

Sample solution: 0.1 mg/mL of Padimate O in methanol

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 308 nm

Column: 4.6-mm × 15-cm; 5-μm packing L1

Flow rate: 1.5 mL/min

Injection volume: 10 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 0.73%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of padimate O (C₁₇H₂₇NO₂) in the portion of Padimate O taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response from the *Sample solution*

r_s = peak response from the *Standard solution*

C_s = concentration of USP Padimate O RS in the *Standard solution* (mg/mL)

C_u = concentration of Padimate O in the *Sample solution* (mg/mL)

Acceptance criteria: 97.0%–102.0%

IMPURITIES• **ORGANIC IMPURITIES**

Sample solution: 10 mg/mL of Padimate O in chloroform

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 3-mm × 1.8-m stainless steel packed with 10% liquid phase G9 on support S1A

Carrier gas: Helium

Column temperature: See *Table 1*.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
150	10	250	10

Injection volume: 2 μL

Analysis

Sample: *Sample solution*

Calculate the percentage of the total impurities in the portion of Padimate O taken:

$$[\Sigma r_i / (\Sigma r_i + r_u)] \times 100$$

r_i = individual impurity peak response from the *Sample solution*

r_u = Padimate O peak response from the *Sample solution*

Acceptance criteria

Total impurities: NMT 2.0%

SPECIFIC TESTS

• **SPECIFIC GRAVITY** (841): 0.990–1.000

• **REFRACTIVE INDEX** (831): 1.5390–1.5430

• **FATS AND FIXED OILS, Acid Value** (401): NMT 1.0

• **FATS AND FIXED OILS, Saponification Value** (401)

Analysis: Proceed as directed in the chapter, except to maintain reflux for 4 h.

Acceptance criteria: 195–215

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• **USP REFERENCE STANDARDS** (11)

USP Padimate O RS

Padimate O Lotion

» Padimate O Lotion contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of C₁₇H₂₇NO₂.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Padimate O RS

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Assay—

Mobile phase—Prepare a suitable filtered and degassed solution containing methanol, water, and glacial acetic acid (85:15:0.5).

Standard preparation—Dissolve an accurately weighed quantity of USP Padimate O RS in isopropyl alcohol and dilute quantitatively, and stepwise if necessary, with isopropyl alcohol to obtain a solution having a known concentration of about 100 μg per mL.

Assay preparation—Transfer an accurately weighed quantity of Lotion, equivalent to about 100 mg of Padimate O, to a 100-mL volumetric flask, and add about 75 mL of isopropyl alcohol. Heat gently with swirling until the specimen is dispersed. Cool to room temperature, dilute with isopropyl alcohol to volume, and mix. Pipet 10.0 mL of this solution into a 100-mL volumetric flask, dilute with isopropyl alcohol to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 308-nm detector and a 4.6-mm × 25-cm column that contains 5-μm base-deactivated packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*; the tailing factor is not more than 2.5 and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of C₁₇H₂₇NO₂ in the portion of Lotion taken by the formula:

$$C(r_u / r_s)$$

in which C is the concentration, in μg per mL, of USP Padimate O RS in the *Standard preparation*, and r_u and r_s are the

peak responses for padimate O obtained from the Assay preparation and the Standard preparation, respectively.

Paliperidone

Change to read:

$C_{23}H_{27}FN_4O_3$ 426.48
4*H*-Pyrido[1,2-*a*]pyrimidin-4-one, 3-[2-[4-(6-fluoro-1,2-benzisoxazol-3-yl)-1-piperidinyl]ethyl]-6,7,8,9-tetrahydro-9-hydroxy-2-methyl-;
• (9*RS*)-3-[2-[4-(6-Fluoro-1,2-benzisoxazol-3-yl)piperidin-1-yl]]ethyl-9-hydroxy-2-methyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one • (ERR 1-Jun-2016) [144598-75-4].

DEFINITION

Paliperidone contains NLT 98.0% and NMT 102.0% of paliperidone ($C_{23}H_{27}FN_4O_3$).

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K): Do not dry the sample.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

• PROCEDURE

Protect the *System suitability solution*, *Standard solution*, and *Sample solution* from light.

Buffer: 28 mM Tetrabutylammonium hydrogen sulfate

Mobile phase: See Table 1.

Solution A: Methanol and Buffer (10:90)

Solution B: Methanol

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
5	100	0
35	85	15
37	100	0
45	100	0

Diluent: Dissolve 0.71 g of dibasic sodium phosphate and 0.62 g of monobasic sodium phosphate in 1 L of water.

System suitability solution: 0.5 mg/mL of USP Paliperidone Resolution Mixture RS prepared as follows. Dissolve first in methanol using 50% of the final flask volume, and dilute with *Diluent*.

Standard solution: 0.5 mg/mL of USP Paliperidone RS prepared as follows. Dissolve first in methanol using 50% of the final flask volume, and dilute with *Diluent*.

Sample solution: 0.5 mg/mL of Paliperidone prepared as follows. Dissolve first in methanol using 50% of the final flask volume, and dilute with *Diluent*.

Chromatographic system

(See Chromatography (621), *System Suitability*.)

Mode: LC

Detector: UV 275 nm

Column: 4.6-mm × 10-cm; 3-μm packing L1

Column temperature: 40°

Flow rate: 0.9 mL/min

Injection volume: 10 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—See Table 2 for relative retention times.]

Suitability requirements

Resolution: NLT 2.0 between paliperidone related compound B and paliperidone; NLT 2.0 between paliperidone and paliperidone hydroxybenzoyl analog, *System suitability solution*

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 0.73%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of paliperidone ($C_{23}H_{27}FN_4O_3$) in the portion of Paliperidone taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Paliperidone RS in the *Standard solution* (mg/mL)

C_U = concentration of Paliperidone in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0%

IMPURITIES

Pamabrom

C₁₁H₁₈BrN₅O₃ 348.20

8-Bromo-3,7-dihydro-1,3-dimethyl-1*H*-purine-2,6-dione compound with 2-amino-2-methyl-1-propanol (1:1).

8-Bromotheophylline compound with 2-amino-2-methyl-1-propanol (1:1) [606-04-02].

» Pamabrom contains not less than 72.2 percent and not more than 76.6 percent of 8-bromotheophylline (C₇H₇BrN₄O₂), calculated on the anhydrous basis; and not less than 24.6 percent and not more than 26.6 percent of 2-amino-2-methyl-1-propanol (C₄H₁₁NO), calculated on the anhydrous basis.

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP 8-Bromotheophylline RS
8-Bromo-3,7-dihydro-1,3-dimethyl-1*H*-purine-2,6-dione.
C₇H₇N₄O₂Br 259.06

USP Theophylline RS

Identification—It responds to the *Thin-layer Chromatographic Identification Test* (201), using a solvent system consisting of a mixture of xylene, methanol, and glacial acetic acid (11:2:1) and a *Standard solution* and a *Test solution* prepared as directed below: the *R_f* value of the principal spot, which appears as a dark spot against a green background, from the *Test solution* corresponds to that obtained from the *Standard solution*.

Standard solution—Transfer an accurately weighed quantity of about 20 mg of USP 8-Bromotheophylline RS to a 100-mL volumetric flask, add 25 mL of water, 50 mL of methanol, and a small amount of dilute ammonium hydroxide. Swirl the flask to effect solution. Dilute the contents of the flask with methanol to volume, and mix.

Test solution—Transfer an accurately weighed quantity of about 25 mg of Pamabrom to a 100-mL volumetric flask, add 25 mL of water, and swirl to dissolve. Dilute the contents of the flask with methanol to volume, and mix.

Water Determination, Method I (921): not more than 3%.

Delete the following:

• **Heavy metals, Method II** (231): 20 µg per g. • (Official 1-Jan-2018)

Limit of theophylline—

Diluting solution, Mobile phase, and Chromatographic system—Proceed as directed in the *Assay for 8-bromotheophylline*.

Standard solution—Dissolve an accurately weighed quantity of USP Theophylline RS in *Diluting solution*, add a few drops of ammonium hydroxide, sonicate if necessary, to obtain a solution having a known concentration of about 1 mg of USP Theophylline RS per mL. Dilute a volume of this solution quantitatively, and stepwise if necessary, with *Diluting solution* to obtain a solution having a known concentration of about 5 µg per mL.

Test solution—Transfer an accurately weighed quantity of about 200 mg of Pamabrom to a 200-mL volumetric flask. Add about 50 mL of *Diluting solution*, and sonicate for

5 minutes. Cool to room temperature, dilute with *Diluting solution* to volume, and mix.

Procedure—Separately inject equal volumes (about 20 μ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of theophylline in the portion of Pamabrom taken by the formula:

$$20(C/W)(r_U/r_S)$$

in which C is the concentration, in μ g per mL, of USP Theophylline RS in the *Standard solution*, W is the weight, in mg, of Pamabrom taken, and r_U and r_S are the peak responses of theophylline obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.5% is found.

Assay for 8-bromotheophylline—

Diluting solution—Prepare a mixture of water and methanol (70:30).

Mobile phase—Prepare a filtered and degassed mixture of water, methanol, and glacial acetic acid (69:30:1), filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Internal standard solution—Dissolve an accurately weighed quantity of caffeine in *Diluting solution*, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a concentration of about 125 μ g of caffeine per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP 8-Bromotheophylline RS in *Diluting solution*, add a few drops of ammonium hydroxide, sonicating if necessary, to obtain a solution having a known concentration of about 0.75 mg of USP 8-Bromotheophylline RS per mL. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, add 10.0 mL of *Internal standard solution*, dilute with *Mobile phase* to volume, mix, and filter.

Assay preparation—Transfer an accurately weighed quantity of about 200 mg of Pamabrom to a 200-mL volumetric flask, add about 50 mL of *Diluting solution* and two drops of ammonium hydroxide, and sonicate for 5 minutes. [NOTE—If a hazy solution is present after 5 minutes of sonication, add 1 additional drop of ammonium hydroxide.] Cool, dilute with *Diluting solution* to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, add 10.0 mL of *Internal standard solution*, dilute with *Mobile phase* to volume, mix, and filter.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm \times 15-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph 20 μ L of the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative retention times are about 0.6 for caffeine and 1.0 for 8-bromotheophylline, the resolution, R , between caffeine and 8-bromotheophylline is not less than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of 8-bromotheophylline ($C_7H_7BrN_4O_2$) in the portion of Pamabrom taken by the formula:

$$4000C(R_U/R_S)$$

in which C is the concentration, in mg per mL, of USP 8-Bromotheophylline RS in the *Standard preparation*, and R_U and R_S are the peak response ratios of the 8-bromotheophylline peak and the internal standard peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Assay for 2-amino-2-methyl-1-propanol—Dissolve about 1 g of Pamabrom, accurately weighed, in 10 mL of water by warming gently on a steam bath until the solution

is clear. Cool, add methyl orange TS, and titrate with 0.5 N hydrochloric acid VS. Perform a blank determination, and make any necessary correction (see *Titrimetry* (541)). Each mL of 0.5 N hydrochloric acid is equivalent to 44.57 mg of $C_4H_{11}NO$.

Pamidronate Disodium

$C_3H_9NNa_2O_7P_2 \cdot 5H_2O$ 369.11

Phosphonic acid, (3-amino-1-hydroxypropylidene)bis-, disodium salt, pentahydrate.

Disodium dihydrogen (3-amino-1-hydroxypropylidene)diphosphonate, pentahydrate [109552-15-0].

Anhydrous 279.06 [57248-88-1].

» Pamidronate Disodium contains not less than 98.0 percent and not more than 102.0 percent of $C_3H_9NNa_2O_7P_2$, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight containers. Store at a temperature not exceeding 30°.

USP Reference standards (11)—

USP Beta Alanine RS

3-Aminopropionic acid.

USP Pamidronate Disodium RS

Clarity and color of solution—

Test preparation 1—Dissolve 1.0 g in 50 mL of water with gentle warming. Cool to room temperature.

Test preparation 2—Dissolve 1.0 g in 25 mL of 2 N sodium hydroxide solution with gentle warming. Cool to room temperature.

Procedure—Examine *Test preparation 1* and *Test preparation 2*: the solutions are clear. Separately measure the absorbance of each of these solutions at 420 nm in 4-cm cells, using water as the blank for *Test preparation 1* and using 2 N sodium hydroxide solution as the blank for *Test preparation 2*: the absorbance of each solution is not more than 0.10.

Identification—

A: Infrared Absorption (197K).

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

C: It meets the requirements of the pyroantimonate precipitate test for Sodium (191).

Microbial enumeration tests (61) and Tests for specified microorganisms (62)—The total aerobic microbial count does not exceed 1000 cfu per g, and the total combined yeasts and molds count does not exceed 100 cfu per g.

pH (791): between 7.8 and 8.8, in a solution (1 in 100).

Water Determination, Method I (921): between 23.0% and 25.5%.

Delete the following:

• **Heavy metals, Method II** (231): 20 μ g per g. • (Official 1-Jan-2018)

Related compounds—**TEST 1—**

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture.

Test solution—Transfer 30 mg of Pamidronate Disodium to a 10-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Standard solution—Dissolve an accurately weighed quantity of USP Beta Alanine RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution containing 0.006 mg of beta alanine per mL.

Application volume: 10 μ L.

Developing solvent system: a mixture of methanol, diisopropyl ether, and 25% ammonia (9:8:4).

Spray reagent—Dissolve 0.2 g of ninhydrin in 100 mL of a mixture of butyl alcohol and 2 N acetic acid (95:5).

Procedure—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* (621). Dry the plate between 100° and 105° until the ammonia disappears completely. Spray with *Spray reagent*, and heat between 100° and 105° for about 15 minutes. Examine the plate under white light. The spot obtained from the *Test solution* having an R_f value of about 0.5 is not greater in size or intensity than the corresponding spot obtained from the *Standard solution*: not more than 0.2% of beta alanine is found. Evaluate any other additional spot in the chromatogram of the *Test solution*, and determine the percentage of total other impurities (excluding beta alanine).

TEST 2—

Mobile phase—Proceed as directed in the *Assay*.

Impurity stock solution 1—Transfer about 300 mg of ortho-phosphoric acid, accurately weighed, to a 1000-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Impurity stock solution 2—Transfer about 250 mg of phosphorous acid, accurately weighed, to a 1000-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Impurity standard solution—Transfer 2.0 mL each of *Impurity stock solution 1* and *Impurity stock solution 2* to a 50-mL volumetric flask, dilute with water to volume, and mix.

Test solution—Prepare as directed for the *Assay preparation*.

Chromatographic system (see *Chromatography* (621))—Proceed as directed in the *Assay*. Chromatograph the *Impurity standard solution*, and record the peak responses as directed for *Procedure*: the elution order is a phosphate peak followed by the phosphite peak; the resolution, R , between the two peaks is not less than 2.5; the relative standard deviation for replicate injections, determined from the phosphate peak, is not more than 10%; and the relative standard deviation for replicate injections, determined from the phosphite peak, is not more than 20%.

Procedure—Separately inject equal volumes (about 100 μ L) of the *Impurity standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of phosphates as ortho-phosphoric acid in the portion of Pamidronate Disodium taken by the formula:

$$0.2(W_1 / W)(r_u / r_s)$$

in which W_1 is the weight, in mg, of ortho-phosphoric acid taken to prepare the *Impurity stock solution 1*; W is the weight, in mg, of Pamidronate Disodium taken to prepare the *Test solution*; and r_u and r_s are the phosphate peak responses obtained from the *Test solution* and the *Impurity standard solution*, respectively: not more than 0.5% of phosphate, determined as ortho-phosphoric acid, is found.

Calculate the percentages of phosphites as phosphorous acid in the portion of Pamidronate Disodium taken by the formula:

$$0.2(W_2 / W)(r_u / r_s)$$

in which W_2 is the weight, in mg, of phosphorous acid taken to prepare the *Impurity stock solution 2*; W is as defined above; and r_u and r_s are the phosphite peak responses obtained from the *Test solution* and the *Impurity standard solution*, respectively: not more than 0.5% of phosphite, determined as phosphorous acid, is found; and not more than 0.5% of total phosphate and phosphite combined is found.

Calculate the percentage of any other impurity in the portion of Pamidronate Disodium taken by the formula:

$$0.2(W_1 / W)(r_i / r_s)$$

in which W_1 and W are as defined above; r_i is the peak response of any other impurity in the *Test solution*; and r_s is the response of the phosphate peak obtained from the *Impurity standard solution*: not more than 0.5% of total other impurities (excluding beta alanine, phosphate as ortho-phosphoric acid, and phosphite as phosphorous acid) is found, the results for *Test 1* and *Test 2* being added.

Assay—

Mobile phase—To 2500 mL of water, add 0.47 mL of anhydrous formic acid, adjust with 2 N sodium hydroxide solution to a pH of 3.5, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)). [NOTE—The small amounts of formic acid have a strong influence on the retention times.]

Standard preparation—Dissolve an accurately weighed quantity of USP Pamidronate Disodium RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 2 mg per mL.

Assay preparation—Transfer about 100 mg of Pamidronate Disodium, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a refractive index detector and a 4.6-mm \times 10-cm column that contains packing L23. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 35°. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not less than 0.3 and not more than 1.2; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 100 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_3H_5NNa_2O_7P_2$ in the portion of Pamidronate Disodium taken by the formula:

$$50C(r_u / r_s)$$

in which C is the concentration, in mg per mL, of USP Pamidronate Disodium RS in the *Standard preparation*; and r_u and r_s are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Pamidronate Disodium for Injection

» Pamidronate Disodium for Injection is a sterile, freeze-dried mixture of Pamidronate Disodium and suitable excipients. It contains not less than 93.0 percent and not more than 108.0 percent of

the labeled amount of pamidronate disodium ($\text{C}_3\text{H}_9\text{NNa}_2\text{O}_7\text{P}_2$).

Change to read:

Packaging and storage—Preserve as described in *Packaging and Storage Requirements* (659), *Injection Packaging, Packaging for constitution* (CN 1-May-2017). Store at controlled room temperature.

USP Reference standards (11)—

USP Beta Alanine RS

3-Aminopropionic acid.

USP Endotoxin RS

USP Pamidronate Disodium RS

Constituted solution—At the time of use, it meets the requirements for *Injections and Implanted Drug Products* (1), *Specific Tests, Completeness and clarity of solutions*

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Bacterial Endotoxins Test (85)—It contains not more than 3.88 USP Endotoxin Units per mg of anhydrous pamidronate disodium.

Uniformity of dosage units (905): meets the requirements for *Weight Variation*.

pH (791): between 6.0 and 7.0, determined in a solution constituted as directed in the labeling.

Particulate Matter in Injections (788): meets the requirements for small-volume injections.

Water Determination, Method 1a (921): not more than 5%.

Limit of beta alanine—

Adsorbent, Application volume, Developing solvent system, and Spray reagent—Proceed as directed for *Related compounds, Test T* under *Pamidronate Disodium*.

Standard solution—Dissolve an accurately weighed quantity of USP Beta Alanine RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution containing 0.0075 mg of beta alanine per mL.

Test solution—Reconstitute the vial with the appropriate amount of water to obtain a solution having a concentration of 3 mg of anhydrous pamidronate disodium per mL, based on the label claim.

Procedure—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* (621). Dry the plate between 100° and 105° until the ammonia disappears completely. Spray with *Spray reagent*, and heat between 100° and 105° for about 15 minutes. Examine the plate under white light. The spot having an R_f value of about 0.5 obtained from the *Test solution* is not greater in size or intensity than the corresponding spot obtained from the *Standard solution*: not more than 0.25% of beta alanine is found.

Other requirements—It meets the requirements under *Sterility Tests* (71) and for *Labeling* (7), *Labels and Labeling for Injectable Products*.

Assay—

Mobile phase and Chromatographic system—Proceed as directed in the *Assay* under *Pamidronate Disodium*.

Standard preparation—Dissolve an accurately weighed quantity of USP Pamidronate Disodium RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 2.5 mg per mL. Calculate the concentration, C_s , of anhydrous pamidronate disodium, the molecular weights of anhydrous and pentahydrate pamidronate disodium being 279.06 and 369.11, respectively.

Assay preparation—Constitute a suitable number of vials of Pamidronate Disodium for Injection with the appropriate

amount of water to obtain a solution having a known concentration of about 2 mg of anhydrous pamidronate disodium per mL, based on the label claim.

Procedure—Separately inject equal volumes (about 100 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $\text{C}_3\text{H}_9\text{NNa}_2\text{O}_7\text{P}_2$ in the portion of Pamidronate Disodium for Injection taken by the formula:

$$100(C_s / C_u)(r_u / r_s)$$

in which C_s is as defined under the *Standard preparation*; C_u is the concentration, in mg per mL, of anhydrous pamidronate disodium in the *Assay preparation*; and r_u and r_s are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Pancreatin

Pancreatin.

Pancreatin [8049-47-6].

» Pancreatin is a substance containing enzymes, principally amylase, lipase, and protease, obtained from the pancreas of the hog, *Sus scrofa* Linné var. *domesticus* Gray (Fam. Suidae) or of the ox, *Bos taurus* Linné (Fam. Bovidae). Pancreatin contains, in each mg, not less than 25 USP Units of amylase activity, not less than 2.0 USP Units of lipase activity, and not less than 25 USP Units of protease activity. Pancreatin of a higher digestive power may be labeled as a whole-number multiple of the three minimum activities or may be diluted by admixture with lactose, or with sucrose containing not more than 3.25 percent of starch, or with pancreatin of lower digestive power.

NOTE—One USP Unit of amylase activity is contained in the amount of pancreatin that decomposes starch at an initial rate such that 0.16 μEq of glycosidic linkage is hydrolyzed per minute under the conditions of the *Assay for amylase activity*.

One USP Unit of lipase activity is contained in the amount of pancreatin that liberates 1.0 μEq of acid per minute at a pH of 9.0 and 37° under the conditions of the *Assay for lipase activity*.

One USP Unit of protease activity is contained in the amount of pancreatin that under the conditions of the *Assay for protease activity* hydrolyzes casein at an initial rate such that there is liberated per minute an amount of peptides not precipitated by trichloroacetic acid that gives the same absorbance at 280 nm as 15 nmol of tyrosine.

Packaging and storage—Preserve in tight containers, at a temperature not exceeding 30°.

USP Reference standards (11)—

USP Bile Salts RS

USP Pancreatin Amylase and Protease RS

USP Pancreatin Lipase RS

Microbial enumeration tests (61) and Tests for specified microorganisms (62)—It meets the requirements of the test for absence of *Salmonella* species and *Escherichia coli*.

Loss on drying (731)—Dry it in vacuum at 60° for 4 hours; it loses not more than 5.0% of its weight.

Fat—Place 2.0 g of Pancreatin in a flask of about 50-mL capacity, add 20 mL of ether, insert the stopper, and set it aside for 2 hours, mixing by rotating at frequent intervals. Decant the supernatant ether by means of a guiding rod into a plain filter about 7 cm in diameter, previously moistened with ether, and collect the filtrate in a tared beaker. Repeat the extraction with a 10-mL portion of ether, proceeding as directed before, then with another 10-mL portion of ether, and transfer the ether and the remainder of the Pancreatin to the filter. Allow to drain, evaporate the ether spontaneously, and dry the residue at 105° for 2 hours; the residue of fat obtained from Pancreatin possessing three or more times the three minimum activities weighs not more than 120 mg (6.0%); that obtained from Pancreatin possessing less than three times the three minimum activities weighs not more than 60 mg (3.0%).

Assay for amylase activity (Starch digestive power)—

pH 6.8 phosphate buffer—On the day of use, dissolve 13.6 g of monobasic potassium phosphate in water to make 500 mL of solution. Dissolve 14.2 g of anhydrous dibasic sodium phosphate in water to make 500 mL of solution. Mix 51 mL of the monobasic potassium phosphate solution with 49 mL of the dibasic sodium phosphate solution. If necessary, adjust by the dropwise addition of the appropriate solution to a pH of 6.8.

Substrate solution—On the day of use, stir a portion of purified soluble starch equivalent to 2.0 g of dried substance with 10 mL of water, and add this mixture to 160 mL of boiling water. Rinse the beaker with 10 mL of water, add it to the hot solution, and heat to boiling, with continuous mixing. Cool to room temperature, and add water to make 200 mL.

Standard preparation—Weigh accurately about 20 mg of USP Pancreatin Amylase and Protease RS into a suitable mortar. Add about 30 mL of pH 6.8 phosphate buffer, and triturate for 5 to 10 minutes. Transfer the mixture with the aid of pH 6.8 phosphate buffer to a 50-mL volumetric flask, dilute with pH 6.8 phosphate buffer to volume, and mix. Calculate the activity, in USP Units of amylase activity per mL, of the resulting solution from the declared potency on the label of the USP Reference Standard.

Assay preparation—For Pancreatin having about the same amylase activity as the USP Pancreatin Amylase and Protease RS, weigh accurately about 40 mg of Pancreatin into a suitable mortar. [NOTE—For Pancreatin having a different amylase activity, weigh accurately the amount necessary to obtain an Assay preparation having amylase activity per mL corresponding approximately to that of the Standard preparation.] Add about 3 mL of pH 6.8 phosphate buffer, and triturate for 5 to 10 minutes. Transfer the mixture with the aid of pH 6.8 phosphate buffer to a 100-mL volumetric flask, dilute with pH 6.8 phosphate buffer to volume, and mix.

Procedure—Prepare four stoppered, 250-mL conical flasks, and mark them S, U, BS, and BU. Pipet into each flask 25 mL of Substrate solution, 10 mL of pH 6.8 phosphate buffer, and 1 mL of sodium chloride solution (11.7 in 1000), insert the stoppers, and mix. Place the flasks in a water bath maintained at 25 ± 0.1°, and allow them to equilibrate. To flasks BU and BS add 2 mL of 1 N hydrochloric acid, mix, and return the flasks to the water bath. To flasks U and BU add 1.0-mL portions of the Assay preparation, and to flasks S and BS add 1.0 mL of the Standard preparation. Mix each, and return the flasks to the water bath. After 10 minutes, accurately timed from the addition of the enzyme, add 2-mL portions of 1 N hydrochloric acid to flasks S and U, and mix. To each flask, with continuous stirring, add 10.0 mL of 0.1 N iodine VS, and immediately add 45 mL of

0.1 N sodium hydroxide. Place the flasks in the dark at a temperature between 15° and 25° for 15 minutes. To each flask add 4 mL of 2 N sulfuric acid, and titrate with 0.1 N sodium thiosulfate VS to the disappearance of the blue color. Calculate the amylase activity, in USP Units per mg, of the Pancreatin taken by the formula:

$$100(C_S / W_U)(V_{BU} - V_U) / (V_{BS} - V_S)$$

in which C_S is the amylase activity of the Standard preparation, in USP Units per mL, W_U is the amount, in mg, of Pancreatin taken, and V_U , V_S , V_{BU} , and V_{BS} are the volumes, in mL, of 0.1 N sodium thiosulfate consumed in the titration of the solutions in flasks U, S, BU, and BS, respectively.

Assay for lipase activity (Fat digestive power)—

Acacia solution—Centrifuge a solution of acacia (1 in 10) until clear. Use only the clear solution.

Olive oil substrate—Combine 165 mL of Acacia solution, 20 mL of olive oil, and 15 g of crushed ice in the cup of an electric blender. Cool the mixture in an ice bath to 5°, and homogenize at high speed for 15 minutes, intermittently cooling in an ice bath to prevent the temperature from exceeding 30°.

Test for suitability of mixing as follows. Place a drop of the homogenate on a microscope slide, and gently press a cover slide in place to spread the liquid. Examine the entire field under high power (43× objective lens and 5× ocular), using an eyepiece equipped with a calibrated micrometer. The substrate is satisfactory if 90% of the particles do not exceed 2 μm in diameter and none exceeds 10 μm in diameter.

Buffer solution—Dissolve 60 mg of tris(hydroxymethyl)aminomethane and 234 mg of sodium chloride in water to make 100 mL.

Bile salts solution—Prepare a solution to contain 80.0 mg of USP Bile Salts RS in each mL.

Standard test dilution—Suspend about 200 mg of USP Pancreatin Lipase RS, accurately weighed, in about 3 mL of cold water in a mortar, triturate for 10 minutes, and add cold water to a volume necessary to produce a concentration of 8 to 16 USP Units of lipase activity per mL, based upon the declared potency on the label of the USP Reference Standard. Maintain the suspension at 4°, and mix before using. For each determination withdraw 5 to 10 mL of the cold suspension, and allow the temperature to rise to 20° before pipeting the exact volume.

Assay test dilution—Suspend about 200 mg of Pancreatin, accurately weighed, in about 3 mL of cold water in a mortar, triturate for 10 minutes, and add cold water to a volume necessary to produce a concentration of 8 to 16 USP Units of lipase activity per mL, based upon the estimated potency of the test material. Maintain the suspension at 4°, and mix before using. For each determination withdraw 5 to 10 mL of the cold suspension, and allow the temperature to rise to 20° before pipeting the exact volume.

Procedure—Mix 10.0 mL of Olive oil substrate, 8.0 mL of Buffer solution, 2.0 mL of Bile salts solution, and 9.0 mL of water in a jacketed glass vessel of about 50-mL capacity, the outer chamber of which is connected to a thermostatically controlled water bath. Cover the mixture, and stir continuously with a mechanical stirring device. With the mixture maintained at a temperature of 37 ± 0.1°, add 0.1 N sodium hydroxide VS, from a microburet inserted through an opening in the cover, and adjust to a pH of 9.20 potentiometrically using a calomel-glass electrode system. Add 1.0 mL of the Assay test dilution, and then continue adding the 0.1 N sodium hydroxide VS for 5 minutes to maintain the pH at 9.0. Determine the volume of 0.1 N sodium hydroxide VS added after each minute.

In the same manner, titrate 1.0 mL of Standard test dilution.

Calculation of potency—Plot the volume of 0.1 N sodium hydroxide VS titrated against time. Using only the points

which fall on the straight-line segment of the curve, calculate the mean acidity released per minute by the test specimen and the Standard. Taking into consideration the dilution factors, calculate the lipase activity, in USP Units, of the Pancreatin taken by comparison to the activity of the Standard, using the lipase activity stated on the label of USP Pancreatin Lipase RS.

Assay for protease activity (Casein digestive power)—

Casein substrate—Place 1.25 g of finely powdered casein in a 100-mL conical flask containing 5 mL of water, shake to form a suspension, add 10 mL of 0.1 N sodium hydroxide, shake for 1 minute, add 50 mL of water, and shake for about 1 hour to dissolve the casein. The resulting solution should have a pH of about 8. If necessary, adjust the pH to about 8, using 1 N sodium hydroxide or 1 N hydrochloric acid. Transfer the solution to a 100-mL volumetric flask, dilute with water to volume, and mix. Use this substrate on the day it is prepared.

Buffer solution—Dissolve 6.8 g of monobasic potassium phosphate and 1.8 g of sodium hydroxide in 950 mL of water in a 1000-mL volumetric flask, adjust to a pH of 7.5 ± 0.2 , using 0.2 N sodium hydroxide, dilute with water to volume, and mix. Store this solution in a refrigerator.

Trichloroacetic acid solution—Dissolve 50 g of trichloroacetic acid in 1000 mL of water. Store this solution at room temperature.

Filter paper—Determine the suitability of the filter paper by filtering a 5-mL portion of *Trichloroacetic acid solution* through the paper and measuring the absorbance of the filtrate at 280 nm, using an unfiltered portion of the same *Trichloroacetic acid solution* as the blank: the absorbance is not more than 0.04. If the absorbance is more than 0.04, the filter paper may be washed repeatedly with *Trichloroacetic acid solution* until the absorbance of the filtrate, determined as above, is not more than 0.04.

Standard test dilution—Add about 100 mg of USP Pancreatin Amylase and Protease RS, accurately weighed, to 100.0 mL of *Buffer solution*, and mix by shaking intermittently at room temperature for about 25 minutes. Dilute quantitatively with *Buffer solution* to obtain a concentration of about 2.5 USP Units of protease activity per mL, based on the potency declared on the label of the Reference Standard.

Assay test dilution—Weigh accurately about 100 mg of Pancreatin into a mortar. Add about 3 mL of *Buffer solution*, and triturate for 5 to 10 minutes. Transfer the mixture with the aid of *Buffer solution* to a 100-mL volumetric flask, dilute with *Buffer solution* to volume, and mix. Dilute quantitatively with *Buffer solution* to obtain a dilution that corresponds in activity to that of the *Standard test dilution*.

Procedure—Label test tubes in duplicate S_1 , S_2 , and S_3 for the standard series, and U for the sample. Pipet into tubes S_1 2.0 mL, into S_2 and U 1.5 mL, and into S_3 1.0 mL of *Buffer solution*. Pipet into tubes S_1 1.0 mL, into S_2 1.5 mL, and into S_3 2.0 mL of the *Standard test dilution*. Pipet into tubes U 1.5 mL of the *Assay test dilution*. Pipet into one tube each of S_1 , S_2 , S_3 , and U 5.0 mL of *Trichloroacetic acid solution*, and mix. Designate these tubes as S_{1B} , S_{2B} , S_{3B} , and U_B , respectively. Prepare a blank by mixing 3 mL of *Buffer solution* and 5 mL of *Trichloroacetic acid solution* in a separate test tube marked B . Place all the tubes in a 40° water bath, insert a glass stirring rod into each tube, and allow for temperature equilibration. At zero time, add to each tube, at timed intervals, 2.0 mL of the *Casein substrate*, preheated to the bath temperature, and mix. Sixty minutes, accurately timed, after the addition of the *Casein substrate* stop the reaction in tubes S_1 , S_2 , S_3 , and U by adding 5.0 mL of *Trichloroacetic acid solution* at the corresponding time intervals, stir, and remove all the tubes from the bath. Allow to stand for 10 minutes at room temperature for complete protein precipitation, and filter. The filtrates must be free from haze. Determine the absorbances of the filtrates, in 1-cm cells, at

280 nm, with a suitable spectrophotometer, using the filtrate from the blank (tube B) to set the instrument.

Calculation of potency—Correct the absorbance values for the filtrates from tubes S_1 , S_2 , and S_3 by subtracting the absorbance values for the filtrates from tubes S_{1B} , S_{2B} , and S_{3B} , respectively, and plot the corrected absorbance values against the corresponding volumes of the *Standard test dilution* used. From the curve, using the corrected absorbance value ($U - U_B$) for the Pancreatin taken, and taking into consideration the dilution factors, calculate the protease activity, in USP Units, of the Pancreatin taken by comparison with that of the Standard, using the protease activity stated on the label of USP Pancreatin Amylase and Protease RS.

Pancreatin Tablets

» Pancreatin Tablets contain not less than 90.0 percent of the labeled amount of pancreatin.

Packaging and storage—Preserve in tight containers, preferably at a temperature not exceeding 30°.

Labeling—Label the Tablets to indicate minimum pancreatic fat digestive power; i.e., single strength, double strength, triple strength.

USP Reference standards (11)—

USP Bile Salts RS

USP Pancreatin Amylase and Protease RS

USP Pancreatin Lipase RS

Microbial enumeration tests (61) and Tests for specified microorganisms (62)—Tablets meet the requirements of the test for absence of *Salmonella* species and *Escherichia coli*.

Disintegration (701): 60 minutes.

Assay for amylase activity (Starch digestive power)—

Weigh and finely powder not fewer than 20 Tablets, avoiding the production of heat during the process. Proceed as directed in the *Assay for amylase activity* under *Pancreatin*, using as the assay preparation an accurately weighed portion of the powder, equivalent to 40 mg of pancreatin. (Use an inversely proportionate amount of the powder if the Tablets are labeled to contain a whole-number multiple of the minimum requirement for pancreatin digestive activity.)

Assay for lipase activity (Fat digestive power)—

Acacia solution, *Olive oil substrate*, *Buffer solution*, *Bile salts solution*, and *Standard test dilution*—Prepare as directed in the *Assay for lipase activity* under *Pancreatin*.

Assay test dilution—Proceed as directed for *Assay test dilution* in the *Assay for lipase activity* under *Pancreatin*, using as the assay preparation an accurately weighed portion of the powder, prepared as directed in the *Assay for amylase activity*, equivalent to about 200 mg of pancreatin.

Procedure and Calculation of potency—Proceed as directed in the *Assay for lipase activity* under *Pancreatin*.

Assay for protease activity (Casein digestive power)—

Casein substrate, *Buffer solution*, *Trichloroacetic acid solution*, *Filter paper* and *Standard test dilution*—Prepare as directed in the *Assay for protease activity* under *Pancreatin*.

Assay test dilution—Add an accurately weighed portion of the powder, prepared as directed in the *Assay for amylase activity*, equivalent to about 100 mg of pancreatin, to 100.0 mL of *Buffer solution*, and mix by shaking intermittently at room temperature for 25 minutes. Dilute quantitatively with *Buffer solution* to obtain a dilution that corresponds in activity to the *Standard test dilution*.

Procedure and Calculation of potency—Proceed as directed in the *Assay for protease activity* under *Pancreatin*.

Pancrelipase

» Pancrelipase is a substance containing enzymes, principally lipase, with amylase and protease, obtained from the pancreas of the hog, *Sus scrofa* Linné var. *domesticus* Gray (Fam. Suidae). It contains, in each mg, not less than 24 USP Units of lipase activity, not less than 100 USP Units of amylase activity, and not less than 100 USP Units of protease activity.

NOTE—One USP Unit of amylase activity is contained in the amount of pancrelipase that decomposes starch at an initial rate such that 0.16 μ Eq of glycosidic linkage is hydrolyzed per minute under the conditions of the *Assay for amylase activity*.

One USP Unit of lipase activity is contained in the amount of pancrelipase that liberates 1.0 μ Eq of acid per minute at pH 9.0 and 37° under the conditions of the *Assay for lipase activity*.

One USP Unit of protease activity is contained in the amount of pancrelipase that under the conditions of the *Assay for protease activity*, hydrolyzes casein at an initial rate such that there is liberated per minute an amount of peptides not precipitated by trichloroacetic acid that gives the same absorbance at 280 nm as 15 nmol of tyrosine.

Packaging and storage—Preserve in tight containers, preferably at a temperature not exceeding 25°.

Labeling—Label it to indicate lipase activity in USP Units.

USP Reference standards (11)—

USP Bile Salts RS

USP Pancreatin Amylase and Protease RS

USP Pancreatin Lipase RS

Microbial enumeration tests (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

Loss on drying (731)—Dry it in vacuum at 60° for 4 hours: it loses not more than 5.0% of its weight.

Fat—Place 2.0 g of Pancrelipase in a flask of about 50-mL capacity, add 20 mL of ether, insert the stopper, and set aside for 2 hours, mixing by rotating at frequent intervals. Decant the supernatant ether by means of a guiding rod into a plain filter about 7 cm in diameter, previously moistened with ether, and collect the filtrate in a tared beaker. Repeat the extraction with a 10-mL portion of ether, then with another 10-mL portion of ether, transfer the ether and the remainder of the Pancrelipase to the filter. Allow to drain, evaporate the ether spontaneously, and dry the residue at 105° for 2 hours: the residue of fat weighs not more than 100 mg (5.0%).

Assay for amylase activity (*Starch digestive power*)—

pH 6.8 Phosphate buffer—On the day of use, dissolve 13.6 g of monobasic potassium phosphate in water to make 500 mL of solution. Dissolve 14.2 g of anhydrous dibasic sodium phosphate in water to make 500 mL of solution. Mix 51 mL of the monobasic potassium phosphate solution with 49 mL of the dibasic sodium phosphate solution. If necessary, adjust by the dropwise addition of the appropriate solution to a pH of 6.8.

Substrate solution—On the day of use, stir a portion of purified soluble starch equivalent to 2.0 g of dried substance

with 10 mL of water, and add this mixture to 160 mL of boiling water. Rinse the beaker with 10 mL of water, add it to the hot solution, and heat to boiling, with continuous mixing. Cool to room temperature, and add water to make 200 mL.

Standard preparation—Weigh accurately about 20 mg of USP Pancreatin Amylase and Protease RS into a suitable mortar. Add about 30 mL of pH 6.8 Phosphate buffer, and triturate for 5 to 10 minutes. Transfer the mixture with the aid of pH 6.8 Phosphate buffer to a 50-mL volumetric flask, dilute with pH 6.8 phosphate buffer to volume, and mix. Calculate the activity, in USP Units of amylase activity per mL, of the resulting solution from the declared potency on the label of the Reference Standard.

Assay preparation—For Pancrelipase having about 4 times the amylase activity of the USP Pancreatin Amylase and Protease RS, weigh accurately about 10 mg of Pancrelipase into a suitable mortar. [NOTE—For Pancrelipase having a different amylase activity, weigh accurately the amount necessary to obtain an *Assay preparation* having amylase activity per mL corresponding approximately to that of the *Standard preparation*.] Add about 3 mL of pH 6.8 Phosphate buffer, and triturate for 5 to 10 minutes. Transfer the mixture with the aid of pH 6.8 Phosphate buffer to a 100-mL volumetric flask, dilute with pH 6.8 Phosphate buffer to volume, and mix.

Procedure—Prepare four stoppered, 250-mL conical flasks, and mark them S, U, BS, and BU. Pipet into each flask 25 mL of *Substrate solution*, 10 mL of pH 6.8 Phosphate buffer, and 1 mL of sodium chloride solution (11.7 in 1000), insert the stoppers, and mix. Place the flasks in a water bath maintained at $25 \pm 0.1^\circ$, and allow them to equilibrate. To flasks BU and BS add 2 mL of 1 N hydrochloric acid, mix, and return the flasks to the water bath. To flasks U and BU add 1.0-mL portions of *Assay preparation*, and to flasks S and BS add 1.0 mL of *Standard preparation*. Mix each, and return the flasks to the water bath. After 10 minutes, accurately timed from the addition of the enzyme, add 2-mL portions of 1 N hydrochloric acid to flasks S and U, and mix. To each flask, with continuous stirring, add 10.0 mL of 0.1 N iodine VS, and immediately add 45 mL of 0.1 N sodium hydroxide. Place the flasks in the dark at a temperature between 15° and 25° for 15 minutes. To each flask add 4 mL of 2 N sulfuric acid, and titrate with 0.1 N sodium thiosulfate VS to the disappearance of the blue color. Calculate the amylase activity, in USP Units per mg, of the Pancrelipase taken by the formula:

$$100(C_S / W_U)(V_{BU} - V_U) / (V_{BS} - V_S)$$

in which C_S is the amylase activity of the *Standard preparation*, in USP Units per mL, W_U is the amount, in mg, of Pancrelipase taken, and V_U , V_S , V_{BU} , and V_{BS} are the volumes, in mL, of 0.1 N sodium thiosulfate consumed in the titration of the solutions in flasks U, S, BU, and BS, respectively.

Assay for lipase activity (*Fat digestive power*)—

Acacia solution—Centrifuge a solution of acacia (1 in 10) until clear. Use only the clear solution.

Olive oil substrate—Combine 165 mL of *Acacia solution*, 20 mL of olive oil, and 15 g of crushed ice in the cup of an electric blender. Cool the mixture in an ice bath to 5°, and homogenize at high speed for 15 minutes, intermittently cooling in an ice bath to prevent the temperature from exceeding 30°.

Test for suitability of mixing as follows. Place a drop of the homogenate on a microscope slide, and gently press a cover slide in place to spread the liquid. Examine the entire field under high power (43× objective lens and 5× ocular), using an eyepiece equipped with a calibrated micrometer. The substrate is satisfactory if 90% of the particles do not exceed 2 μ m in diameter and none exceeds 10 μ m in diameter.

Buffer solution—Dissolve 60 mg of tris(hydroxymethyl)aminomethane and 234 mg of sodium chloride in water to make 100 mL.

Bile salts solution—Prepare a solution to contain 80.0 mg of USP Bile Salts RS in each mL.

Standard test dilution—Suspend about 200 mg of USP Pancreatin Lipase RS, accurately weighed, in about 3 mL of cold water in a mortar, triturate for 10 minutes, and add cold water to a volume necessary to produce a concentration of 8 to 16 USP Units of lipase activity per mL, based upon the declared potency on the label of the Reference Standard. Maintain the suspension at 4°, and mix before using. For each determination withdraw 5 to 10 mL of the cold suspension, and allow the temperature to rise to 20° before pipeting the exact volume.

Assay test dilution—Suspend about 200 mg of Pancrelipase, accurately weighed, in about 3 mL of cold water in a mortar, triturate for 10 minutes, and add cold water to a volume necessary to produce a concentration of 8 to 16 USP Units of lipase activity per mL, based upon the estimated potency of the test material. Maintain the suspension at 4°, and mix before using. For each determination withdraw 5 to 10 mL of the cold suspension, and allow the temperature to rise to 20° before pipeting the exact volume.

Procedure—Mix 10.0 mL of *Olive oil substrate*, 8.0 mL of *Buffer solution*, 2.0 mL of *Bile salts solution*, and 9.0 mL of water in a jacketed glass vessel of about 50-mL capacity, the outer chamber of which is connected to a thermostatically controlled water bath. Cover the mixture, and stir continuously with a mechanical stirring device. With the mixture maintained at a temperature of $37 \pm 0.1^\circ$, add 0.1 N sodium hydroxide VS, from a microburet inserted through an opening in the cover, to adjust the pH to 9.20 potentiometrically using a calomel-glass electrode system. Add 1.0 mL of *Assay test dilution*, and then continue adding the 0.1 N sodium hydroxide VS for 5 minutes to maintain the pH at 9.0. Determine the volume of 0.1 N sodium hydroxide VS added after each minute.

In the same manner titrate 1.0 mL of *Standard test dilution*.

Calculation of potency—Plot the volume of 0.1 N sodium hydroxide VS titrated against time. Using only the points which fall on the straight-line segment of the curve, calculate the mean acidity released per minute by the test specimen and the Standard. Taking into consideration the dilution factors, calculate the lipase activity, in USP Units, of the Pancrelipase taken by comparison to the activity of the Reference Standard, using the lipase activity stated on the label of USP Pancreatin Lipase RS.

Assay for protease activity (Casein digestive power)—

Casein substrate—Place 1.25 g of finely powdered casein in a 100-mL conical flask containing 5 mL of water, shake to form a suspension, add 10 mL of 0.1 N sodium hydroxide, shake for 1 minute, add 50 mL of water, and shake for about 1 hour to dissolve the casein. If necessary, adjust to a pH of about 8, using 1 N sodium hydroxide or 1 N hydrochloric acid. Transfer the solution quantitatively to a 100-mL volumetric flask, dilute with water to volume, and mix. Use this substrate on the day it is prepared.

Buffer solution—Dissolve 6.8 g of monobasic potassium phosphate and 1.8 g of sodium hydroxide in 950 mL of water in a 1000-mL volumetric flask, adjust to a pH of 7.5 ± 0.2 , using 0.2 N sodium hydroxide, dilute with water to volume, and mix. Store this solution in a refrigerator.

Trichloroacetic acid solution—Dissolve 50 g of trichloroacetic acid in 1000 mL of water. This solution may be stored at room temperature.

Filter paper—Determine the suitability of the filter paper by filtering a 5-mL portion of *Trichloroacetic acid solution* through the paper and measuring the absorbance of the filtrate at 280 nm, using an unfiltered portion of the same *Trichloroacetic acid solution* as the blank: the absorbance is

not more than 0.04. If the absorbance is more than 0.04, wash the filter paper repeatedly with *Trichloroacetic acid solution* until the absorbance of the filtrate, determined as above, is not more than 0.04.

Standard test dilution—Add about 100 mg of USP Pancreatin Amylase and Protease RS, accurately weighed, to 100.0 mL of *Buffer solution*, and mix by shaking intermittently at room temperature for about 25 minutes. Dilute quantitatively with *Buffer solution* to produce a concentration of about 2.5 USP Units of protease activity per mL, based upon the declared potency on the label of the Reference Standard.

Assay test dilution—Weigh accurately about 100 mg of Pancrelipase into a suitable mortar. Add about 3 mL of *Buffer solution*, and triturate for 5 to 10 minutes. Transfer the mixture with the aid of *Buffer solution* to a 100-mL volumetric flask, dilute with *Buffer solution* to volume, and mix. Dilute quantitatively with *Buffer solution* to obtain a dilution that corresponds in activity to the *Standard test dilution*.

Procedure—Label test tubes in duplicate S_1 , S_2 , and S_3 for the standard series, and U for the sample. Pipet into tubes S_1 2.0 mL, into S_2 and U 1.5 mL, and into S_3 1.0 mL of *Buffer solution*. Pipet into tubes S_1 1.0 mL, into S_2 1.5 mL, and into S_3 2.0 mL of the *Standard test dilution*. Pipet into tubes U 1.5 mL of the *Assay test dilution*. Pipet into one tube each of S_1 , S_2 , S_3 , and U 5.0 mL of *Trichloroacetic acid solution*, and mix. Designate these tubes as S_{1B} , S_{2B} , S_{3B} , and U_B , respectively. Prepare a blank by mixing 3 mL of *Buffer solution* and 5 mL of *Trichloroacetic acid solution* in a separate test tube marked B . Place all the tubes in a 40° water bath, insert a glass stirring rod into each tube, and allow for temperature equilibration. At zero time, add to each tube, at timed intervals, 2.0 mL of the *Casein substrate*, preheated to the bath temperature, and mix. Sixty minutes, accurately timed, after the addition of the *Casein substrate* stop the reaction in tubes S_1 , S_2 , S_3 , and U by adding 5.0 mL of *Trichloroacetic acid solution* at the corresponding time intervals, stir, and remove all the tubes from the bath. Allow to stand at room temperature for 10 minutes for complete protein precipitation, and filter. The filtrates must be free from haze. Determine the absorbances of the filtrates, in 1-cm cells, at 280 nm, with a suitable spectrophotometer, using the filtrate from the blank (tube B) to set the instrument.

Calculation of potency—Correct the absorbance values for the filtrates from tubes S_1 , S_2 , and S_3 by subtracting the absorbance values for the filtrates from tubes S_{1B} , S_{2B} , and S_{3B} , respectively, and plot the corrected absorbance values against the corresponding volumes of the *Standard test dilution* used. From the curve, using the corrected absorbance value ($U - U_B$) for the Pancrelipase taken, and taking into consideration the dilution factors, calculate the protease activity, in USP Units, of the Pancrelipase taken by comparison with that of the Standard, using the protease activity stated on the label of USP Pancreatin Amylase and Protease RS.

Pancrelipase Capsules

» Pancrelipase Capsules contain an amount of Pancrelipase equivalent to not less than 90.0 percent and not more than 150.0 percent of the labeled lipase activity expressed in USP Units, the labeled activity being not less than 8000 USP Units per Capsule. They contain, in each Capsule, the pancrelipase equivalent of not less than 30,000 USP Units of amylase activity, and not less than 30,000 USP Units of protease activity.

Packaging and storage—Preserve in tight containers, preferably with a desiccant, at a temperature not exceeding 25°.

Labeling—Label the Capsules to indicate lipase activity in USP Units.

USP Reference standards (11)—

USP Bile Salts RS

USP Pancreatin Amylase and Protease RS

USP Pancreatin Lipase RS

Microbial enumeration tests (61) and **Tests for specified microorganisms** (62)—Capsules meet the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

Loss on drying (731)—Dry the contents of 10 Capsules in vacuum at 60° for 4 hours: it loses not more than 5.0% of its weight.

Assay—Weigh the contents of not less than 10 Capsules, and determine the average weight per capsule. Mix the combined contents, and proceed as directed for *Assay for amylase activity*, *Assay for lipase activity*, and *Assay for protease activity* under *Pancrelipase*.

Pancrelipase Delayed-Release Capsules

» Pancrelipase Delayed-Release Capsules contain an amount of Pancrelipase equivalent to not less than 90.0 percent and not more than 165.0 percent of the labeled lipase. It contains not less than 90.0 percent of the labeled activities of amylase and protease expressed in the respective USP Units.

Packaging and storage—Preserve in tight containers at controlled room temperature.

Labeling—Label the Capsules to indicate lipase, amylase, and protease activities in USP Units. The label also indicates that the Capsule contents are enteric-coated.

USP Reference standards (11)—

USP Bile Salts RS

USP Pancreatin Amylase and Protease RS

USP Pancreatin Lipase RS

Microbial enumeration tests (61) and **Tests for specified microorganisms** (62)—Capsules meet the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

Dissolution (711)—

PART 1—

Medium: simulated gastric fluid TS, without enzyme; 800 mL.

Apparatus 1: 100 rpm.

Time: 60 minutes.

PART 2—

pH 6.0 phosphate buffer—Dissolve 8 g of sodium chloride and 36.8 g of monobasic potassium phosphate in 4000 mL of water. Adjust with 2 N sodium hydroxide to a pH of 6.0 ± 0.1.

Medium: pH 6.0 phosphate buffer; 800 mL.

Apparatus 2: 100 rpm.

Time: 30 minutes.

Standard solution—Proceed as directed under *Standard test dilution* in the *Assay for lipase activity* under *Pancrelipase*, except to use the *Dissolution Medium* in place of cold water.

Test solution—Empty the contents of 10 Capsules, and transfer an accurately weighed portion of the contents, equivalent to the concentration of USP Units of lipase activity per mL in the *Standard solution* (between 8 and 16 Units per mL), to *Apparatus 1*.

Procedure—Proceed according to the conditions for *Part 1*. After 1 hour, remove the baskets, and allow the excess *Dissolution Medium* to drain. Transfer the contents of each basket to the dissolution vessels in *Part 2* with the aid of a few mL of *Dissolution Medium*. Proceed according to the conditions for *Part 2*. After 30 minutes, remove a 10-mL portion of the solution under test, transfer to a test tube, and cool to 4°. Proceed as directed in the *Assay for lipase activity* under *Pancrelipase*.

Tolerances—Not less than 75% (Q) of the labeled USP Units of lipase activity per Capsule is dissolved.

Loss on drying (731)—Dry the contents of 10 Capsules in vacuum at 60° for 4 hours: the test specimen loses not more than 5.0% of its weight.

Assay—Weigh the contents of not less than 10 Capsules, and determine the average weight per Capsule. Grind the contents, mix the combined contents, and proceed as directed in the *Assay for lipase activity*, the *Assay for amylase activity*, and the *Assay for protease activity* under *Pancrelipase*.

Pancrelipase Tablets

» Pancrelipase Tablets contain an amount of Pancrelipase equivalent to not less than 90.0 percent and not more than 150.0 percent of the labeled lipase activity expressed in USP Units, the labeled activity being not less than 8000 USP Units per Tablet. They contain, in each Tablet, the pancrelipase equivalent of not less than 30,000 USP Units of amylase activity, and not less than 30,000 USP Units of protease activity.

Packaging and storage—Preserve in tight containers, preferably with a desiccant, at a temperature not exceeding 25°.

Labeling—Label the Tablets to indicate the lipase activity in USP Units.

USP Reference standards (11)—

USP Bile Salts RS

USP Pancreatin Amylase and Protease RS

USP Pancreatin Lipase RS

Microbial enumeration tests (61) and **Tests for specified microorganisms** (62)—Tablets meet the requirements of the test for absence of *Salmonella* species and *Escherichia coli*.

Disintegration (701): 75 minutes.

Loss on drying (731)—Dry about 5 g, accurately weighed, of finely ground Tablets in vacuum at 60° for 4 hours: it loses not more than 5.0% of its weight.

Assay—Weigh and finely powder not less than 20 Tablets, avoiding the production of heat during the process, and proceed as directed for *Assay for amylase activity*, *Assay for lipase activity*, and *Assay for protease activity* under *Pancrelipase*.

Pancuronium Bromide

$C_{35}H_{60}Br_2N_2O_4$ 732.67

Piperidinium, 1,1'-[(2 β ,3 α ,5 α ,16 β ,17 β)-3,17-bis(acetyloxy)androstane-2,16-diyl]bis[1-methyl]-, dibromide; 1,1'-(3 α ,17 β -Dihydroxy-5 α -androstane-2 β ,16 β -ylene)bis[1-methylpiperidinium] dibromide diacetate; 2 β ,16 β -Dipiperidino-5 α -androstane-3 α ,17 β -diol diacetate dimethobromide [15500-66-0].

DEFINITION

Pancuronium Bromide contains NLT 98.0% and NMT 102.0% of pancuronium bromide ($C_{35}H_{60}Br_2N_2O_4$), calculated on the anhydrous basis.

IDENTIFICATION

- A. INFRARED ABSORPTION** (197K)
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- C. IDENTIFICATION TESTS—GENERAL, Bromide** (191): A solution (1 in 10) meets the requirements of the silver nitrate precipitate test for bromide.

ASSAY

PROCEDURE

Diluent: 0.0024 M hydrochloric acid

Mobile phase: Acetonitrile, methanol, and 0.024 M hydrochloric acid (125:200:675)

Standard stock solution: 1.0 mg/mL prepared as follows. Transfer the required quantity of USP Pancuronium Bromide RS to a suitable volumetric flask. Dissolve in 2% of the flask volume of acetonitrile, dilute with *Diluent* to volume, and sonicate for 3 min.

Standard solution: 0.1 mg/mL of USP Pancuronium Bromide RS in *Diluent*, from the *Standard stock solution*

Sample stock solution: 1.0 mg/mL prepared as follows. Transfer the required quantity of Pancuronium Bromide to a suitable volumetric flask. Dissolve in 2% of the flask volume of acetonitrile, dilute with *Diluent* to volume, and sonicate for 3 min.

Sample solution: 0.1 mg/mL of Pancuronium Bromide in *Diluent*, from the *Sample stock solution*

Chromatographic system

Relative standard deviation: NMT 1.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of pancuronium bromide ($C_{35}H_{60}Br_2N_2O_4$) in the portion of Pancuronium Bromide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Pancuronium Bromide RS in the *Standard solution* (mg/mL)

C_U = concentration of Pancuronium Bromide in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

IMPURITIES

RESIDUE ON IGNITION (281): NMT 0.1%

ORGANIC IMPURITIES

Diluent, Mobile phase, Standard stock solution, and Chromatographic system: Proceed as directed in the *Assay*.

System suitability solution: 1 mg/mL of USP Pancuronium Bromide RS and 0.02 mg/mL each of USP Pancuronium Bromide Related Compound A RS, USP Pancuronium Bromide Related Compound B RS, USP Pancuronium Bromide Related Compound C RS, and USP Vecuronium Bromide RS, prepared as follows. Transfer the required amounts of the individual components to a suitable volumetric flask. Dissolve in 2% of the flask volume of acetonitrile, dilute with *Diluent* to volume, and sonicate for 3 min.

Standard solution: 0.01 mg/mL of USP Pancuronium Bromide RS in *Diluent*, from the *Standard stock solution*

Sample solution: 1.0 mg/mL prepared as follows.

Transfer the required quantity of Pancuronium Bromide to a suitable volumetric flask. Dissolve in 2% of the flask volume of acetonitrile, dilute with *Diluent* to volume, and sonicate for 3 min.

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—See *Table 1* for the relative retention times.]

Suitability requirements

Resolution: NLT 1.5 between pancuronium related compound B and pancuronium related compound A, and NLT 1.5 between the pancuronium related compound C and vecuronium peaks, *System suitability solution*

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 10.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity, including any unspecified impurity, in the portion of Pancuronium Bromide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of pancuronium from the *Standard solution*

- C_s = concentration of USP Pancuronium Bromide RS in the *Standard solution* (mg/mL)
 C_u = concentration of Pancuronium Bromide in the *Sample solution* (mg/mL)
 F = relative response factor (see Table 1)
 Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)

Pancuronium Bromide Injection

DEFINITION

Pancuronium Bromide Injection is a sterile solution containing NLT 92.0% and NMT 105.0% of the labeled amount of pancuronium bromide ($C_{35}H_{60}Br_2N_2O_4$) in Water for Injection. It contains a suitable tonicity-adjusting agent.

IDENTIFICATION

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

PROCEDURE

Mobile phase: Acetonitrile, methanol, and 0.024 M hydrochloric acid (125:220:655)

Diluent: 0.0024 M hydrochloric acid

Standard stock solution: 1.0 mg/mL of USP Pancuronium Bromide RS prepared as follows. Transfer the required quantity of USP Pancuronium Bromide RS to a suitable volumetric flask. Dissolve in 2% of the flask volume of acetonitrile. Dilute with *Diluent* to volume. Sonicate for 3 min.

Standard solution: 0.1 mg/mL of USP Pancuronium Bromide RS from the *Standard stock solution* and *Diluent*

Sample solution: Nominally 0.1 mg/mL of pancuronium bromide from a suitable volume of Injection in *Diluent*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Conductivity with suppression

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Temperatures

Detector: 40°

Column: 35°

Suppressor: 4-mm cationic membrane suppressor or equivalent

Suppression solution: 0.15 M tetrabutylammonium hydroxide

Suppressor flow rate: 1 mL/min

Flow rate: 0.75 mL/min

Injection volume: 25 μ L

Run time: 2 times the retention time of pancuronium

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 1.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of pancuronium bromide ($C_{35}H_{60}Br_2N_2O_4$) in the portion of Injection taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response from the *Sample solution*

r_s = peak response from the *Standard solution*

C_s = concentration of USP Pancuronium Bromide RS in the *Standard solution* (mg/mL)

C_u = nominal concentration of pancuronium bromide in the *Sample solution* (mg/mL)

Acceptance criteria: 92.0%–105.0%

IMPURITIES

ORGANIC IMPURITIES

Diluent, Standard stock solution, and Chromatographic system: Proceed as directed in the Assay.

Mobile phase: Acetonitrile, methanol, and 0.024 M hydrochloric acid (125:180:695)

System suitability solution: 1 mg/mL of USP Pancuronium Bromide RS and 0.02 mg/mL each of USP Pancuronium Bromide Related Compound A RS, USP Pancuronium Bromide Related Compound B RS, USP Pancuronium Bromide Related Compound C RS, and USP Vecuronium Bromide RS prepared as follows. Transfer the required amounts of the individual components to a suitable volumetric flask. Dissolve in 2% of the flask volume of acetonitrile, and dilute with *Diluent* to volume. Sonicate for 3 min.

Standard solution: 0.02 mg/mL of USP Pancuronium Bromide RS from the *Standard stock solution* and *Diluent*

Sample solution: Nominally 1.0 mg/mL of pancuronium bromide from a suitable volume of Injection in *Diluent*

System suitability

Samples: *System suitability solution* and *Standard solution*

Panthenol

C₉H₁₉NO₄

205.25

Butanamide, 2,4-dihydroxy-N-(3-hydroxypropyl)-3,3-dimethyl-, (±)-;

(±)-2,4-Dihydroxy-N-(3-hydroxypropyl)-3,3-dimethylbutanamide;

(±)-Pantothenyl alcohol [16485-10-2].

DEFINITION

Panthenol is a racemic mixture of the dextrorotatory and levorotatory isomers of panthenol. It contains NLT 99.0% and NMT 102.0% of racemic panthenol (C₉H₁₉NO₄), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197M)**

- **B.**

Sample solution: 100 mg/mL of Panthenol

Analysis: To 1 mL of the *Sample solution* add 5 mL of 1 N sodium hydroxide and 1 drop of cupric sulfate TS, and shake vigorously.

Acceptance criteria: A deep blue color develops.

- **C.**

Sample solution: 10 mg/mL of Panthenol

Analysis: To 1 mL of the *Sample solution* add 1 mL of 1 N hydrochloric acid, and heat on a steam bath for 30 min. Cool, add 100 mg of hydroxylamine hydrochloride, and add 5 mL of 1 N sodium hydroxide. Allow to stand for 5 min, then adjust with 1 N hydrochloric acid to a pH of 2.5–3.0, and add 1 drop of ferric chloride TS.

Acceptance criteria: A purplish red color develops.

ASSAY

- **PROCEDURE**

0.1 M potassium biphthalate: Transfer 20.42 g of potassium biphthalate into a 1000-mL volumetric flask, and add sufficient glacial acetic acid to dissolve. If necessary, warm the mixture on a steam bath to achieve complete solution, observing precautions against absorption of moisture. Cool to room temperature, and dilute with glacial acetic acid to volume.

Sample: 400 mg of Panthenol

Blank: Proceed as directed in the *Analysis*, omitting the *Sample*.

Titrimetric system

(See *Titrimetry (541)*.)

Mode: Residual titration
Titrant: 0.1 N perchloric acid VS
Back-titrant: 0.1 M potassium biphthalate
Endpoint detection: Visual

Analysis: Transfer the *Sample* to a 300-mL flask fitted to a reflux condenser by means of a standard-taper glass joint, add 50.0 mL of *Titrant*, and reflux for 5 h. Cool, observing precautions to prevent atmospheric moisture from entering the condenser, and rinse the condenser with glacial acetic acid, collecting the rinsings in the flask. To the flask add 5 drops of crystal violet TS, and titrate with the *Back-titrant* to a blue-green endpoint. Perform the *Blank* determination.

Calculate the percentage of panthenol ($C_5H_{19}NO_4$) in the *Sample* taken:

$$\text{Result} = \{[(V_B - V_S) \times M \times F] / W\} \times 100$$

V_B = *Back-titrant* volume consumed by the *Blank* (mL)

V_S = *Back-titrant* volume consumed by the *Sample* (mL)

M = actual molarity of the *Back-titrant* (mM/mL)

F = equivalency factor, 205.3 mg/M

W = *Sample* weight (mg)

Acceptance criteria: 99.0%–102.0% on the dried basis

IMPURITIES

• **RESIDUE ON IGNITION** (281): NMT 0.1%

• **LIMIT OF AMINOPROPANOL**

Sample: 10 g of Panthenol

Blank: 25 mL of water

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.01 N sulfuric acid VS

Endpoint detection: Visual

Analysis: Dissolve the *Sample* in 25 mL of water, and add bromothymol blue TS. Titrate with the *Titrant* to a yellow endpoint. Perform the *Blank* determination.

Calculate the percentage of aminopropanol in the *Sample* taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F] / W\} \times 100$$

V_S = *Titrant* volume consumed by the *Sample* (mL)

V_B = *Titrant* volume consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 75.11 mg/mEq

W = *Sample* weight (mg)

Acceptance criteria: NMT 0.10%

SPECIFIC TESTS

• **MELTING RANGE, Class I** (741): 64.5°–68.5°

• **OPTICAL ROTATION, Specific Rotation** (781S)

Sample solution: 50 mg/mL in water

Acceptance criteria: –0.05° to +0.05°

• **LOSS ON DRYING** (731): Dry a sample in a vacuum over phosphorus pentoxide at 56° for 4 h; it loses NMT 0.5% of its weight.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **USP REFERENCE STANDARDS** (11)

USP Racemic Panthenol RS

follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).¹

Pantoprazole Sodium	200 mg
Sodium Bicarbonate 8.4% Injection, a sufficient quantity to make	100 mL

Calculate the required quantity of each ingredient for the total amount to be prepared. Remove the trademark imprint from the tablets by gently rubbing on a paper towel that has been dampened with Alcohol, USP. Allow the tablets to air-dry for a few min. Triturate the tablets to a coarse powder by using a mortar and pestle, and transfer to a calibrated bottle. Add 50 mL of *Sodium Bicarbonate 8.4% Injection* and agitate until the coating is dissolved. Add sufficient *Sodium Bicarbonate 8.4% Injection* to bring the final volume to 100 mL and mix well until the powder is uniformly suspended.

[NOTE—If the imprint is not properly removed, the pharmaceutical elegance of the final product will be compromised by the presence of flecks of dark material.]

ASSAY

PROCEDURE

Mobile phase: Acetonitrile and 50 mM dibasic potassium phosphate (2:3). Adjust with phosphoric acid to a pH of 7.0. Make adjustments if necessary.

Standard stock solution: 1.0 mg/mL of USP Pantoprazole Sodium RS in water

Standard solution: Transfer 1.5 mL of *Standard stock solution* to a 100-mL volumetric flask, and dilute with water to volume in order to obtain a solution containing about 15 µg/mL of pantoprazole sodium. Pass through a suitable filter of 0.22-µm pore size.

Sample solution: Shake thoroughly by hand each bottle of Oral Suspension. Accurately pipet 3.75 mL of Oral Suspension to a 50-mL volumetric flask. Add 25 mL of water to the flask, and place on an orbital shaker for 20 min. Dilute with water to volume. Take a 5-mL portion of the diluted sample and further dilute with water to 50 mL to obtain a solution with a nominal concentration of 15 µg/mL of pantoprazole sodium. Pass through a suitable filter of 0.22-µm pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Flow rate: 1.6 mL/min

Injection size: 10 µL

System suitability

Sample: *Standard solution*

[NOTE—The retention time for the pantoprazole peak is about 2.6 min.]

Suitability requirements

Relative standard deviation: NMT 1.0% for the replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of $C_{16}H_{14}F_2N_3NaO_4S \cdot 1.5 H_2O$ in the volume of Oral Suspension taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of pantoprazole sodium in the *Standard solution* (µg/mL)

C_U = nominal concentration of pantoprazole sodium in the *Sample solution* (µg/mL)

¹ This formula is frequently used for home health patients with feeding tubes who have been discharged from hospitals. The goal of the drug is to neutralize the acidity of the stomach.

Pantoprazole Oral Suspension

DEFINITION

Pantoprazole Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled content of pantoprazole sodium. Prepare Pantoprazole Oral Suspension, 2 mg/mL, as

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- **pH (791):** Between 7.9 and 8.3

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled cold temperature.
- **LABELING:** Label it to indicate that it is to be well-shaken before use, and to state the *Beyond-Use Date*.
- **BEYOND-USE DATE:** NMT 14 days after the date on which it was compounded when stored at controlled cold temperature
- **USP REFERENCE STANDARDS (11)**
USP Pantoprazole Sodium RS

$C_{32}H_{28}F_4N_6O_8S_2$ 764.74

Identification—

A: *Infrared Absorption* (197K).

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the

chromatogram of the *Standard preparation*, as obtained in the *Assay*.

C: It meets the requirements of the pyroantimonate precipitate test for *Sodium* (191).

Water Determination, Method I (921): between 5.0% and 8.0%.

Delete the following:

• **Heavy metals, Method II (231):** not more than 0.002%.

• (Official 1-Jan-2018)

Related compounds—[NOTE—On the basis of the synthetic route, perform either *Test 1* or *Test 2*. *Test 2* is recommended when impurities C, D, E, and F are potential related compounds.]

TEST 1—[NOTE—Protect all solutions from light, and use amber autosampler vials and low-actinic glassware.]

Diluent, Mobile phase, System suitability preparation, and Chromatographic system—Proceed as directed in the *Assay*.

Standard solution—Transfer about 20 mg of USP Pantoprazole Sodium RS, accurately weighed, to a 50-mL volumetric flask, dissolve in 5 to 10 mL of a mixture of acetonitrile and water (1:1), and dilute with *Diluent* to volume. Further dilute with *Diluent* quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.0004 mg per mL.

Test solution—Transfer about 20 mg of Pantoprazole Sodium, accurately weighed, to a 50-mL volumetric flask, dissolve in 5 to 10 mL of a mixture of acetonitrile and water (1:1), dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—Prepare as directed in the *Assay*. Chromatograph the *System suitability preparation*, and record the peak responses as directed for *Procedure*. Identify the components on the basis of their relative retention times (*Table 1*): the resolution, *R*, between the pantoprazole related compound A and pantoprazole peaks is not less than 10.0.

Table 1

Name	Relative Retention Time	Limit (%)
Pantoprazole related compound A ¹	0.52	0.20
Pantoprazole sodium	1.0	N/A
Pantoprazole related compound B ²	1.7	0.15
Any other individual impurity	—	0.10
Total impurities	—	0.5

¹ 5-(Difluoromethoxy)-2-[(3,4-dimethoxy-2-pyridyl)methyl]sulfonyl]-1*H*-benzimidazole.

² 5-(Difluoromethoxy)-2-[(3,4-dimethoxy-2-pyridyl)methyl]thio]-1*H*-benzimidazole.

Procedure—Separately inject equal volumes (about 20 μ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Pantoprazole Sodium taken by the formula:

$$100(C_s / C_r)(r_i / r_s)$$

in which C_s and C_r are the concentrations, in mg per mL, of pantoprazole sodium in the *Standard solution* and the *Test solution*, respectively; r_i is the peak response of each impurity obtained from the *Test solution*; and r_s is the pantoprazole peak response obtained from the *Standard solution*. The reporting level for impurities is 0.05%.

TEST 2—

Diluent—Prepare a mixture of acetonitrile and 0.001 N sodium hydroxide solution (50:50).

Standard solution—Dissolve an accurately weighed quantity of USP Pantoprazole Sodium RS in *Diluent*, and dilute quantitatively to obtain a solution having a known concentration of about 0.03 mg per mL.

Test solution—Prepare a solution of Pantoprazole Sodium in *Diluent* having a known concentration of about 0.46 mg per mL.

System suitability solution—Dissolve suitable amounts of USP Pantoprazole Sodium RS, USP Pantoprazole Related Compound A RS, USP Pantoprazole Related Compound B RS, USP Pantoprazole Related Compound C RS, USP Pantoprazole Related Compound D and F Mixture RS, and USP Pantoprazole Related Compound E RS in *Diluent* to obtain a solution containing about 0.46 mg of pantoprazole sodium per mL and about 1.3 µg each of related compounds A, B, C, and E per mL, and about 1.3 µg of the D and F mixture per mL.

Solution A—Prepare a solution of dibasic potassium phosphate (1.74 g/L) adjusted with a solution of phosphoric acid (330 g/L) to a pH of 7.00 ± 0.05.

Solution B—Use acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed below for *Chromatographic system*. Make adjustments as necessary (see *System Suitability* under *Chromatography* (621)).

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with either a programmable variable wavelength detector or two separate detectors capable of monitoring at 290 nm and at 305 nm, and a 4-mm × 12.5-cm column that contains 5-µm packing L1. The column temperature is maintained at 40°. The flow rate is about 1.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–40	80→20	20→80	linear gradient
40–45	20→80	80→20	linear gradient
45–55	80	20	re-equilibration

Chromatograph the *System suitability solution*, and record the peak responses at 290 nm as directed for *Procedure*. Identify the components based on relative retention times (*Table 2*): the resolution, *R*, between pantoprazole related compound E and pantoprazole related compounds D and F is not less than 1.5. Chromatograph the *Standard solution* at 290 nm, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2; and the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms at 290 nm and 305 nm, and measure the responses for the major peaks.

[NOTE—Pantoprazole related compound C is monitored using a wavelength of 305 nm, and all other compounds are monitored at 290 nm.] Calculate the percentage of each impurity in the portion of Pantoprazole Sodium taken by the formula:

$$100 (1 / F)(C_s / C_t)(r_i / r_s)$$

in which *C_s* is the concentration, in mg per mL, of pantoprazole sodium in the *Standard solution*; *C_t* is the concentration, in mg per mL of Pantoprazole Sodium in the *Test solution*; *F* is the response factor of an individual pantoprazole related compound relative to the response of pantoprazole sodium (*Table 2*); *r_i* is the peak response of each impurity obtained from the *Test solution*; and *r_s* is the pantoprazole peak response obtained from the *Standard solution*. The reporting level for impurities is 0.05%.

Table 2

Impurity Name	Relative Retention Time	Relative Response Factor (F)	Limit (%)
Related compound A	0.9	1.0	0.20
Related compound B	1.5	1.0	0.15
Related compound C ¹	0.6	3.3	0.10 ²
Related compounds D ³ and F ⁵	1.2	1.0	0.20 ⁴
Related compound E ⁶	1.3	1.0	0.10
Any other individual impurity	—	—	0.10
Total impurities	—	—	0.5

¹ 5-(Difluoromethoxy)-1*H*-benzimidazole-2-thiol.

² At 305 nm.

³ 5-(Difluoromethoxy)-2-[(*RS*)-[(3,4-dimethoxypyridin-2-yl)methyl]sulfanyl]-1-methyl-1*H*-benzimidazole.

⁴ Impurities D and F are not fully resolved and should be integrated together.

⁵ 6-(Difluoromethoxy)-2-[(*RS*)-[(3,4-dimethoxypyridin-2-yl)methyl]sulfanyl]-1-methyl-1*H*-benzimidazole.

⁶ Mixture of the stereoisomers of 6,6'-bis(difluoromethoxy)-2,2'-bis[[[3,4-dimethoxypyridin-2-yl)methyl]sulfanyl]-1*H*,1'*H*-5,5'-bibenzimidazolyl.

Assay—[NOTE—Protect all solutions from light, and use amber autosampler vials and low-actinic glassware.]

Ammonium phosphate buffer—Dissolve 1.32 g of dibasic ammonium phosphate in 1000 mL of water. Adjust with phosphoric acid to a pH of 7.5.

Acetonitrile-methanol mixture—Prepare a mixture of acetonitrile and methanol (7:3).

Solution A—Use a filtered and degassed mixture of *Ammonium phosphate buffer* and *Acetonitrile-methanol mixture* (85:15).

Solution B—Use *Acetonitrile-methanol mixture*.

Diluent—Transfer 25 mL of ammonium hydroxide to a suitable container, and dilute with water to 500 mL.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

System suitability preparation—Dissolve suitable amounts of USP Pantoprazole Sodium RS, USP Pantoprazole Related Compound A RS, and USP Pantoprazole Related Compound B RS in a mixture of acetonitrile and water (1:1) to obtain a solution having about 0.5 mg of each component per mL. Transfer 1 mL of this solution to a 100-mL volumetric flask, and dilute with *Diluent* to volume.

Standard preparation—Transfer about 20 mg of USP Pantoprazole Sodium RS, accurately weighed, to a 50-mL volumetric flask, dissolve in 5 to 10 mL of a mixture of acetonitrile and water (1:1), and dilute with *Diluent* to volume. Further dilute with *Diluent* quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.06 mg per mL.

Assay preparation—Transfer about 20 mg of Pantoprazole Sodium, accurately weighed, to a 50-mL volumetric flask, dissolve in 5 to 10 mL of a mixture of acetonitrile and water (1:1), and dilute with *Diluent* to volume. Further dilute with *Diluent* quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.06 mg per mL.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 285-nm detector and 3.9-mm × 15-cm column that contains 4-µm packing L1. The flow rate is about 1 mL per minute. The column temperature is maintained at 30°, and the autosampler temperature is maintained at 4°. The chromatograph is programmed as follows:

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–10	86	14	isocratic
10–35	86→42	14→58	linear gradient
35–36	42→86	58→14	linear gradient
36–46	86	14	re-equilibration

Chromatograph the *System suitability preparation*, and record the peak responses as directed for *Procedure*. Identify the components based on their relative retention times (Table 1): the resolution, R , between the pantoprazole related compound A and pantoprazole peaks is not less than 10.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $C_{16}H_{14}F_2N_3NaO_4S$ in the portion of Pantoprazole Sodium taken by the formula:

$$100(C_s / C_u)(r_u / r_s)$$

in which C_s and C_u are the concentrations, in mg per mL, of pantoprazole sodium in the *Standard preparation* and the *Assay preparation*, respectively; and r_u and r_s are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Pantoprazole Sodium Delayed-Release Tablets

DEFINITION

Pantoprazole Sodium Delayed-Release Tablets contain an amount of Pantoprazole Sodium equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of pantoprazole ($C_{16}H_{14}F_2N_3O_4S$).

IDENTIFICATION

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Solution A: Dissolve 3.85 g of ammonium acetate and 1.1 g of tetrabutylammonium hydrogen sulfate in 1 L of water, and adjust with ammonium hydroxide solution diluted 1:1 with water to a pH of 7.9.

Diluent: Mixture of acetonitrile and 0.02 N sodium hydroxide (1:1)

Mobile phase: Prepare a mixture of acetonitrile and *Solution A* (35:65).

Standard solution: Transfer a weighed quantity of USP Pantoprazole Sodium RS to a suitable volumetric flask, add 0.02 N sodium hydroxide to about 60% of the final volume, sonicate for 5 min to dissolve, add about 2% of acetonitrile, and dilute with 0.02 N sodium hydroxide to volume to obtain a solution having a known concentration of about 0.2 mg/mL of pantoprazole sodium.

System suitability solution: Prepare a solution in 0.02 N sodium hydroxide, using sonication if necessary, containing about 0.2 mg/mL of pantoprazole sodium and about 0.0004 mg/mL each of USP Pantoprazole Related Compound A RS and USP Pantoprazole Related Compound B RS.

Sample solution: Transfer 5 Tablets into a suitable volumetric flask. [NOTE—Use 50- or 100-mL volumetric flasks for Tablets containing 20 or 40 mg of pantoprazole per Tablet, respectively.] Add *Diluent* to about 60% of the final volume, shake mechanically for about 60 min, and dilute with *Diluent* to volume. Pass through a suitable filter, and dilute the filtrate with 0.02 N sodium hydroxide to obtain a solution having a known concentration of about 0.2 mg/mL of pantoprazole, based on the label claim.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 290 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Flow rate: 1 mL/min

Injection size: 20 μ L

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 3 between pantoprazole and pantoprazole related compound A, *System suitability solution*

Tailing factor: NMT 2.0, *System suitability solution*

Relative standard deviation: NMT 2.0% for replicate injections, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $C_{16}H_{14}F_2N_3O_4S$ in the portion of Tablets taken:

$$\text{Result} = (r_u / r_s) \times (C_s / C_u) \times (M_{r1} / M_{r2}) \times 100$$

r_u = peak response from the *Sample solution*

r_s = peak response from the *Standard solution*

C_s = concentration of USP Pantoprazole Sodium RS in the *Standard solution* (mg/mL)

C_u = nominal concentration of pantoprazole in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of pantoprazole, 383.37

M_{r2} = molecular weight of pantoprazole sodium, 405.35

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

DISSOLUTION (711)

Test 1: Proceed as directed for *Apparatus 1* and *Apparatus 2*, *Delayed-Release Dosage Forms*, *Method B*, *Procedure*.

Acid stage

Acid stage medium: 0.1 N hydrochloric acid; 1000 mL

Apparatus 2: 75 rpm

Time: 120 min

Determine the amount of pantoprazole dissolved in the *Acid stage* using the following procedure.

Sample solution: After 120 min, withdraw an aliquot, pass through a suitable filter of 0.45- μ m pore size, and immediately dilute a portion of the filtrate by a factor of 2 with 0.5 N sodium hydroxide. Transfer the Tablets to the vessels containing the *Buffer stage medium*.

Diluent: Prepare a mixture of pH 6.8 phosphate buffer and 0.5 N sodium hydroxide (1:1).

Mobile phase: Acetonitrile, triethylamine, and water (40:1:60). Adjust with phosphoric acid to a pH of 7.0 \pm 0.05.

Standard stock solution: Transfer about 20 mg of USP Pantoprazole Sodium RS to a 50-mL volumetric flask. Add about 30 mL of 0.02 N sodium hydroxide, and sonicate until dissolved. Add 2 mL of acetonitrile, and dilute with 0.02 N sodium hydroxide to volume.

Standard solution: Transfer 1.0 mL of the *Standard stock solution* to a 20-mL volumetric flask, and dilute with *Diluent* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 290 nm

Column: 4.6-mm × 7.5-cm; 3-μm packing L1

Column temperature: 30°

Flow rate: 1 mL/min

Injection size: 10 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the amount of pantoprazole released, as a percentage, in the *Acid stage*:

$$\text{Result} = (r_U/r_S) \times C_S \times (M_{r1}/M_{r2}) \times V \times (100/L)$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of pantoprazole sodium in the *Standard solution* (mg/mL)

M_{r1} = molecular weight of pantoprazole, 383.37

M_{r2} = molecular weight of pantoprazole sodium, 405.35

V = volume of *Medium*, 1000 mL

L = Tablet label claim (mg)

Tolerances: NMT 10% of the labeled amount of pantoprazole is dissolved.

Buffer stage

Buffer stage medium: pH 6.8 phosphate buffer; 1000 mL

Apparatus 2: 75 rpm

Time: 30 min

Analysis: After 30 min, withdraw an aliquot, pass through a suitable filter of 0.45-μm pore size, and immediately dilute a portion of the filtrate by a factor of 2 with 0.5 N sodium hydroxide. Determine the amount of pantoprazole dissolved in the *Buffer stage* using the same procedure as for the *Acid stage*.

Tolerances: NLT 75% (Q) of the labeled amount of pantoprazole is dissolved.

Test 2: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*. Proceed as directed for *Apparatus 1* and *Apparatus 2*, *Delayed-Release Dosage Forms*, *Method B*, *Procedure*.

Acid stage

Acid stage medium: 0.1 N hydrochloric acid; 1000 mL

Apparatus 2: 100 rpm

Time: 2 h

Standard stock solution: Transfer a quantity of USP Pantoprazole Sodium RS to a suitable volumetric flask. Dissolve first in 0.1 N sodium hydroxide, using 10% of the final volume, then dilute with pH 6.8 phosphate buffer to volume, to obtain a solution having a known concentration of about 0.46 mg of pantoprazole sodium per mL. Mix well until a clear solution is obtained. Calculate the concentration in mg of pantoprazole per mL, the molecular weights of pantoprazole and pantoprazole sodium being 383.37 and 405.35, respectively.

Acid stage standard solution: Dilute an appropriate volume of the *Standard stock solution* to 1 L with *Acid stage medium* in such a way as to obtain a final concentration of about 10% of the Tablet label claim per L.

Sample solution: Pass a portion of the solution under test through a suitable filter of 10-μm pore size.

Analysis: Determine the amount of pantoprazole dissolved by using UV absorption at the wavelength of about 305 nm on portions of the *Sample solution* in comparison to the *Acid stage working standard solution* using a 4-cm path length cell and *Acid stage medium* as blank. Drain the *Acid stage medium* from each vessel and replace with *Buffer stage medium*. Calculate the amount of pantoprazole dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times (100/L)$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of pantoprazole in the *Acid stage standard solution* (mg/mL)

V = volume of *Medium*, 1000 mL

L = Tablet label claim of pantoprazole (mg)

Tolerances: NMT 10% of the labeled amount of pantoprazole is dissolved.

Buffer stage

Buffer stage medium: pH 6.8 phosphate buffer; 1000 mL

Apparatus 2: 100 rpm

Time: 45 min

Buffer stage standard solution: Dilute an appropriate volume of the *Standard stock solution* as described under *Acid stage* to 250 mL with *Buffer stage medium* in such a way as to obtain a final concentration of about 100% of the Tablet label claim per L.

Sample solution: Pass a portion of the solution under test through a suitable filter of 10-μm pore size.

Analysis: Determine the amount of pantoprazole dissolved by using UV absorption at the wavelength of maximum absorbance at about 288 nm on portions of the *Sample solution* in comparison to *Buffer stage standard solution* using a 0.5-cm path length cell and *Buffer stage medium* as blank.

Calculate the amount of pantoprazole dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times (100/L)$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Buffer stage standard solution*

C_S = concentration of pantoprazole in the *Buffer stage standard solution* (mg/mL)

V = volume of the *Buffer stage medium*, 1000 mL

L = Tablet label claim (mg)

Tolerances: NLT 75% (Q) of the labeled amount of pantoprazole is dissolved.

Test 3: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 3*. Proceed as directed for *Apparatus 1* and *Apparatus 2*, *Delayed-Release Dosage Forms*, *Method B*, *Procedure*.

Acid stage

Acid stage medium: 0.1 N hydrochloric acid; 1000 mL

Apparatus 2: 100 rpm

Time: 2 h

Dilute ammonia solution: Transfer 40 mL of strong ammonia solution to a 100-mL volumetric flask, and dilute with water to volume.

Buffer solution: Transfer 1.5 g of ammonium acetate to a 1000-mL volumetric flask. Dissolve in and dilute with water to volume. Adjust the pH with *Dilute ammonia solution* to 7.0 ± 0.1.

Mobile phase: Methanol and *Buffer solution* (2:3)

Standard solution: 0.4 mg/mL. Transfer a quantity of USP Pantoprazole Sodium RS to a suitable volumetric flask, add 10% of the final volume of methanol, sonicate, and dilute with *Mobile phase* to volume.

Sample solution: After 2 h in the *Acid stage medium*, decant the medium from the vessel, remove the Tablet from the vessel, and dry it with tissue paper.

Transfer the Tablet to a suitable volumetric flask, add 20% of the final volume of methanol, and sonicate for about 20 min. Dilute with *Mobile phase* to volume to obtain a final concentration of about 0.4 mg/mL of pantoprazole. Mix well, centrifuge, and use the supernatant.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 290 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Temperature

Column: Ambient

Autosampler: 4°

Flow rate: 1.5 mL/min

Injection size: 10 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 7500 theoretical plates

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the amount of pantoprazole released, as a percentage, in the *Acid stage*:

$$\text{Result} = A - [(r_U/r_S) \times C_S \times D_U \times (M_{r1}/M_{r2}) \times (100/L)]$$

A = percentage of pantoprazole as determined in the *Assay*

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of pantoprazole sodium in the *Standard solution* (mg/mL)

D_U = dilution factor of the *Sample solution*

M_{r1} = molecular weight of pantoprazole, 383.37

M_{r2} = molecular weight of pantoprazole sodium, 405.35

L = Tablet-label claim (mg)

Tolerances: NMT 10% of the labeled amount of pantoprazole is dissolved.

Buffer stage

Buffer stage medium: pH 6.8 phosphate buffer; 1000 mL

Apparatus 2: 100 rpm

Time: 45 min

Standard solution: Further dilute an appropriate volume of the *Standard solution* prepared in the *Acid stage* with *Buffer stage medium* to obtain a solution having a known concentration of about 0.04 mg/mL.

Sample solution: Transfer a separate Tablet to the vessel containing *Acid stage medium*, and proceed as directed for the *Acid stage*. After 2 h, decant the *Acid stage medium*, add the *Buffer stage medium*, and operate the apparatus at the specified conditions. After 45 min, withdraw 10 mL of the solution under test, and pass it through a suitable filter of 0.45-μm pore size.

Analysis: Determine the amount of pantoprazole released to the *Buffer stage medium* using the same chromatographic procedure as directed for the *Acid stage*, with the exception of injecting about 50 μL of the *Standard solution* and *Sample solution*.

Calculate the amount of pantoprazole dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times (M_{r1}/M_{r2}) \times V \times (100/L)$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of pantoprazole sodium in the *Standard solution* (mg/mL)

M_{r1} = molecular weight of pantoprazole, 383.37

M_{r2} = molecular weight of pantoprazole sodium, 405.35

V = volume of *Medium*, 1000 mL

L = Tablet label claim (mg)

Tolerances: NLT 75% (Q) of the labeled amount of pantoprazole is dissolved.

Test 4: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 4*. Proceed as directed for *Apparatus 1* and *Apparatus 2*, *Delayed-Release Dosage Forms*, *Method B*, *Procedure*.

Acid stage

Acid stage medium: 0.1 N hydrochloric acid; 1000 mL, degassed

Apparatus 2: 100 rpm, with sinkers

Time: 2 h

Determine the amount of pantoprazole remaining in the Tablet, using the following procedure.

Diluent: Water and acetonitrile (7:3)

Buffer solution: 771 mg/L of ammonium acetate in water. Adjust with acetic acid or ammonium hydroxide to a pH of 8.5 ± 0.1.

Solution A: *Buffer solution* and acetonitrile (7:3)

Solution B: Acetonitrile

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
6	100	0
17	27	73
18	100	0
22	100	0

System suitability solution: Prepare a solution containing 0.0068 mg/mL of USP Pantoprazole Related Compound A in *Diluent*. Transfer 10 mL of this solution to a 100-mL volumetric flask, add 23 mg of USP Pantoprazole Sodium RS, and dilute with *Diluent* to volume.

Acid stage standard solution: 0.23 mg/mL of USP Pantoprazole Sodium RS in *Diluent*

Sample solution: After 2 h in the *Acid stage medium*, carefully remove the Tablet from the vessel and transfer to a suitable volumetric flask. Add 50% of the final volume of *Diluent*, and sonicate for 20 min (but not more than 60 min), swirling the flask every few min. Dilute with *Diluent* to volume to obtain a final concentration of about 0.2 mg/mL of pantoprazole.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 290 nm

Column: 3.9-mm × 15-cm; 5-μm packing L1

Temperature

Column: 30°

Autosampler: 4°

Flow rate: 1 mL/min

Injection size: 20 μL

System suitability

Samples: *System suitability solution* and *Acid stage standard solution*

Suitability requirements

Resolution: NLT 1.5 between pantoprazole related compound A and pantoprazole, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Acid stage standard solution*

Calculate the percentage of pantoprazole released:

$$\text{Result} = A - [(r_U/r_S) \times (C_S/L) \times D_U \times (M_{r1}/M_{r2}) \times 100]$$

A = percentage of pantoprazole as determined in the *Assay*

r_U = peak area from the *Sample solution*

r_S = peak area from the *Acid stage standard solution*

- C_s = concentration of the *Acid stage standard solution* (mg/mL)
 L = Tablet label claim (mg)
 D_u = dilution factor of the *Sample solution*
 M_{r1} = molecular weight of pantoprazole, 383.37
 M_{r2} = molecular weight of pantoprazole sodium, 405.35

Tolerances: NMT 10% (Q) of the labeled amount of pantoprazole is dissolved.

Buffer stage

Buffer stage medium: pH 6.8 phosphate buffer (76.0 g/L of tribasic sodium phosphate dodecahydrate in water. Add 250 mL of this solution to 750 mL of *Acid stage medium*, adjust with hydrochloric acid or sodium hydroxide to a pH of 6.80 ± 0.05); 1000 mL, degassed.

Apparatus 2: 100 rpm, with sinkers

Time: 45 min

Buffer stage standard solution: 1.6 mg/mL of USP Pantoprazole Sodium RS in methanol. This solution is stable for 5 days at room temperature and 7 days when refrigerated. Dilute this solution with *Buffer stage medium* to obtain a concentration of L/1000 mg/mL, where L is the Tablet label claim in mg.

Sample solution: Transfer a Tablet with the sinker to the vessel containing *Acid stage medium*, and proceed as directed for the *Acid stage*. After 2 h, remove the *Acid stage medium*, add the *Buffer stage medium*, and operate the apparatus under the specified conditions. After 45 min, withdraw 10 mL of the solution under test, and pass it through a suitable filter of 0.45- μ m pore size.

Analytical wavelength: UV 289 nm

Path length cell: 1 cm

Blank: *Buffer stage medium*

Calculate the percentage of pantoprazole released:

$$\text{Result} = (A_u/A_s) \times (C_s/L) \times (M_{r1}/M_{r2}) \times V \times 100$$

- A_u = absorbance of the *Sample solution*
 A_s = absorbance of the *Buffer stage standard solution*
 C_s = concentration of the *Buffer stage standard solution* (mg/mL)
 L = Tablet label claim (mg)
 M_{r1} = molecular weight of pantoprazole, 383.37
 M_{r2} = molecular weight of pantoprazole sodium, 405.35
 V = volume of *Buffer stage medium*, 1000 mL

Tolerances: NLT 75% (Q) of the labeled amount of pantoprazole is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES

Organic Impurities

PROCEDURE

Mobile phase, System suitability solution, Sample solution, and Chromatographic system: Prepare as directed in the *Assay*.

Standard solution: 0.0004 mg/mL. Dilute the *Standard solution*, prepared as directed in the *Assay*, with 0.02 N sodium hydroxide.

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

[NOTE—Identify the components on the basis of the relative retention times shown in *Impurity Table 1*.]

Resolution: NLT 3 between pantoprazole and pantoprazole related compound A, *System suitability solution*

Tailing factor: NMT 2.0 for pantoprazole, *System suitability solution*

Relative standard deviation: NMT 10.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Record the chromatograms for at least three times the retention time of the pantoprazole peak. Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times (M_{r1}/M_{r2}) \times 100$$

- r_u = peak response for each impurity from the *Sample solution*
 r_s = peak response from the *Standard solution*
 C_s = concentration of USP Pantoprazole Sodium RS in the *Standard solution* (mg/mL)
 C_u = nominal concentration of pantoprazole in the *Sample solution* (mg/mL)
 M_{r1} = molecular weight of pantoprazole, 383.37
 M_{r2} = molecular weight of pantoprazole sodium, 405.35

Acceptance criteria: The limits are given in *Impurity Table 1*. The reporting level for impurities is 0.1%.

Impurity Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Pantoprazole	1.0	—
Related compounds D ^a and F ^b	1.2	0.5 ^c
Pantoprazole related compound A ^d	1.3	0.5
Pantoprazole related compound B ^e	2.7	0.3
Any other individual impurity	—	0.2
Total impurities	—	1.0

^a 5-(Difluoromethoxy)-2-[(RS)-[(3,4-dimethoxypyridin-2-yl)methyl]sulfinyl]-1-methyl-1H-benzimidazole.

^b 6-(Difluoromethoxy)-2-[(RS)-[(3,4-dimethoxypyridin-2-yl)methyl]sulfinyl]-1-methyl-1H-benzimidazole.

^c Impurities D and F are not fully resolved and should be integrated together.

^d 5-(Difluoromethoxy)-2-[[[(3,4-dimethoxy-2-pyridyl)methyl]sulfonyl]-1H-benzimidazole.

^e 5-(Difluoromethoxy)-2-[[[(3,4-dimethoxy-2-pyridyl)methyl]thio]-1H-benzimidazole.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at controlled room temperature.
- **LABELING:** Label Tablets to indicate that they must not be split, chewed, or crushed before administration. When more than one *Dissolution* test is given, the labeling states the test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS (11)**
 - USP Pantoprazole Related Compound A RS
5-(Difluoromethoxy)-2-[[[(3,4-dimethoxy-2-pyridinyl)methyl]sulfonyl]-1H-benzimidazole.

Papain

Papain [9001-73-4].

DEFINITION

Papain is a purified proteolytic substance derived from *Carica papaya* Linné (Fam. Caricaceae). Papain, prepared as directed in the Assay, contains NLT 6000 Units/mg. Papain of a higher digestive power may be reduced to the official standard by admixture with papain of lower activity, lactose, or other suitable diluents.

One USP Unit of Papain activity is that which releases the equivalent of 1 µg of tyrosine from a specified casein substrate under the conditions of the Assay, using the enzyme concentration that liberates 40 µg of tyrosine per mL of Sample solution.

ASSAY

• CASEIN DIGESTIVE POWER

Dibasic sodium phosphate solution: Dissolve 7.1 g of anhydrous dibasic sodium phosphate in water to make 1 L. Add 1 drop of toluene as a preservative.

Citric acid solution: Dissolve 10.5 g of citric acid monohydrate in water to make 1 L. Add 1 drop of toluene as a preservative.

Casein substrate: Disperse 1 g of Hammersten-type casein in 50 mL of Dibasic sodium phosphate solution. Place in a boiling water bath for 30 min with occasional stirring. Cool to room temperature, and add Citric acid solution to adjust to a pH of 6.0 ± 0.1 . Stir the solution rapidly and continuously during the addition of the Citric acid solution to prevent precipitation of the casein. Dilute with water to 100 mL. Prepare fresh daily.

Buffer solution: Dissolve 3.55 g of anhydrous dibasic sodium phosphate in 400 mL of water in a 500-mL volumetric flask. Add 7.0 g of disodium edetate and 3.05 g of cysteine hydrochloride monohydrate. Adjust with 1 N hydrochloric acid or 1 N sodium hydroxide to a pH of 6.0 ± 0.1 , dilute with water to volume, and mix. Prepare fresh daily.

Trichloroacetic acid solution: 300 mg/mL of reagent-grade trichloroacetic acid. This solution may be stored at room temperature.

Standard solution: Weigh accurately 100 mg of USP Papain RS in a 100-mL volumetric flask, and add Buffer solution to dissolve. Dilute with Buffer solution to volume, and mix. Transfer 2.0 mL of this solution to a 50-mL volumetric flask, dilute with Buffer solution to volume, and mix. Use within 30 min after preparation.

Sample solution: Weigh accurately an amount of Papain equivalent to about 100 mg of USP Papain RS in a 100-mL volumetric flask, and add Buffer solution to dissolve. Dilute with Buffer solution to volume, and mix. Transfer 2.0 mL of this solution to a 50-mL volumetric flask, dilute with Buffer solution to volume, and mix. Use within 30 min after preparation.

Analysis: Into each of 12 test tubes (18 × 150 mm) pipet 5.0 mL of Casein solution. Place in a water bath at 40°, and allow 10 min to reach bath temperature. The tests are run in duplicate except for the blanks. Into each of two of the tubes labeled S_1 pipet 1.0 mL of the Standard solution and 1.0 mL of Buffer solution. Mix by swirling, note zero time, insert the stopper, and replace in the bath. Into each of two tubes labeled S_2 pipet 1.5 mL of the Standard solution and 0.5 mL of Buffer solution, and proceed as before. Repeat this procedure for two more tubes labeled S_3 to which 2.0 mL of the Standard solution is added, and for two tubes labeled U_2 to which 1.5 mL of the Sample solution and 0.5 mL of Buffer solution are added. After 60 min, accurately timed, add to all 12 tubes 3.0 mL of Trichloroacetic acid solution, and shake vigorously. With the four tubes to which neither the Standard solution nor the Sample solution was added, prepare blanks by pipeting, respec-

tively, 1.0 mL of the Standard solution and 1.0 mL of Buffer solution; 1.5 mL of the Standard solution and 0.5 mL of Buffer solution; 2.0 mL of the Standard solution; and 1.5 mL of the Sample solution and 0.5 mL of Buffer solution. Replace all tubes in the 40° water bath for 30–40 min to allow the precipitated protein to coagulate fully. Pass through filter paper of medium pore size, discarding the first 3 mL of the filtrate (filtrates used are clear). Read the absorbances, at 280 nm, of the filtrates of all solutions against their respective blanks. Plot the absorbance readings for S_1 , S_2 , and S_3 against the enzyme concentration of each corresponding level.

By interpolation from this curve, taking into consideration dilution factors, calculate the potency in Units in the weight of Papain taken:

$$\text{Result} = A \times C \times F$$

A = activity of the USP Papain RS (Units/mg)

C = concentration from the standard curve (mg/mL)

F = $100 \times (50/2) \times (10/1.5)$, dilution factor

Acceptance criteria: NLT 6000 Units/mg

SPECIFIC TESTS

• pH (791)

Sample solution: 1 in 50

Acceptance criteria: 4.8–6.2

• LOSS ON DRYING (731)

Analysis: Dry under vacuum at 60° for 4 h.

Acceptance criteria: NMT 7.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store in a cool place.

• **USP REFERENCE STANDARDS (11)**

USP Papain RS

Papain Tablets for Topical Solution

DEFINITION

Papain Tablets for Topical Solution contain NLT 100.0% of the labeled potency.

ASSAY

• PROCEDURE

Dibasic sodium phosphate solution: Dissolve 7.1 g of anhydrous dibasic sodium phosphate in water to make 1 L. Add 1 drop of toluene as a preservative.

Citric acid solution: Dissolve 10.5 g of citric acid monohydrate in water to make 1 L. Add 1 drop of toluene as a preservative.

Casein substrate: Disperse 1 g of Hammersten-type casein in 50 mL of Dibasic sodium phosphate solution.

Place in a boiling water bath for 30 min with occasional stirring. Cool to room temperature, and add Citric acid solution to adjust to a pH of 6.0 ± 0.1 . Stir the solution rapidly and continuously during the addition of the Citric acid solution to prevent precipitation of the casein. Dilute with water to 100 mL. Prepare fresh daily.

Buffer solution: Dissolve 3.55 g of anhydrous dibasic sodium phosphate in 400 mL of water in a 500-mL volumetric flask. Add 7.0 g of disodium edetate and 3.05 g of cysteine hydrochloride monohydrate. Adjust with 1 N hydrochloric acid or 1 N sodium hydroxide to a pH of 6.0 ± 0.1 , dilute with water to volume, and mix. Prepare fresh daily.

Trichloroacetic acid solution: 300 mg/mL of reagent-grade trichloroacetic acid. This solution may be stored at room temperature.

Standard solution: Weigh accurately 100 mg of USP Papain RS in a 100-mL volumetric flask, and add *Buffer solution* to dissolve. Dilute with *Buffer solution* to volume, and mix. Transfer 2.0 mL of this solution to a 50-mL volumetric flask, dilute with *Buffer solution* to volume, and mix. Use within 30 min after preparation.

Sample solution: Place a counted number of Papain Tablets for Topical Solution, equivalent to about 600,000 USP Units of Papain, in a 100-mL volumetric flask, dissolve in *Buffer solution*, dilute with *Buffer solution* to volume, and mix. Transfer 2.0 mL of this solution to a 50-mL volumetric flask, dilute with *Buffer solution* to volume, and mix.

Analysis: Into each of 12 test tubes (18 × 150 mm) pipet 5.0 mL of *Casein substrate*. Place in a water bath at 40°, and allow 10 min to reach bath temperature. The tests are run in duplicate except for the blanks. Into each of two of the tubes labeled S₁ pipet 1.0 mL of the *Standard solution* and 1.0 mL of *Buffer solution*. Mix by swirling, note zero time, insert the stopper, and replace in the bath. Into each of two other tubes labeled S₂ pipet 1.5 mL of the *Standard solution* and 0.5 mL of *Buffer solution*, and proceed as before. Repeat this procedure for two tubes labeled S₃ to which 2.0 mL of the *Standard solution* is added, and for two tubes labeled U₂ to which 1.5 mL of the *Sample solution* and 0.5 mL of *Buffer solution* are added. After 60 min, accurately timed, add to all 12 tubes 3.0 mL of *Trichloroacetic acid solution*, and shake vigorously. With the four tubes to which neither the *Standard solution* nor the *Sample solution* was added, prepare blanks by pipeting, respectively, 1.0 mL of the *Standard solution* and 1.0 mL of *Buffer solution*; 1.5 mL of the *Standard solution* and 0.5 mL of *Buffer solution*; 2.0 mL of the *Standard solution*; and 1.5 mL of the *Sample solution* and 0.5 mL of *Buffer solution*. Replace all tubes in the 40° water bath for 30–40 min to allow the precipitated protein to coagulate fully. Pass through filter paper of medium pore size, discarding the first 3 mL of the filtrate (filtrates used are clear). Read the absorbances, at 280 nm, of the filtrates of all solutions against their respective blanks. Plot the absorbance readings for S₁, S₂, and S₃ against the enzyme concentration of each corresponding level.

By interpolation from the standard curve, calculate the potency, in USP Units, of the number of Papain Tablets for Topical Solution taken:

$$\text{Result} = A \times C \times F$$

A = activity of the USP Papain RS (Units/mg)

C = concentration from the standard curve (mg/mL)

F = $100 \times (50/2) \times (10/1.5)$, dilution factor

Acceptance criteria: NLT 100.0% of the labeled potency

PERFORMANCE TESTS

- **DISINTEGRATION** (701): NMT 15 min at 23 ± 2°

SPECIFIC TESTS

- **COMPLETENESS OF SOLUTION** (641)

Sample solution: Prepare a solution of 50 Papain Tablets for Topical Solution in 500.0 mL of water, and allow to stand for 4 h.

Analysis: Pass the *Sample solution* through two superimposed, matched-weight, 47-mm-diameter membrane filters of 0.8-μm pore size, and wash the residue by rinsing the flask at the sides of the holder with water. Dry both filters in a desiccator under vacuum, over phosphorus pentoxide for 6–18 h. Weigh the filters separately, and subtract the weight of the lower filter from that of the upper filter.

Acceptance criteria: NMT 50 mg (1 mg/Tablet) difference in weights

- **MICROBIAL ENUMERATION TESTS** (61) AND **TESTS FOR SPECIFIED MICROORGANISMS** (62): It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

- **pH** (791)

Sample solution: 1 Tablet in 10 mL of water

Acceptance criteria: 6.9–8.0

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store in a cool place.

- **USP REFERENCE STANDARDS** (11)

USP Papain RS

Papaverine Hydrochloride

C₂₀H₂₁NO₄ · HCl 375.85

Isoquinoline, 1-[(3,4-dimethoxyphenyl)methyl]-6,7-dimethoxy-, hydrochloride.

6,7-Dimethoxy-1-veratrylisoquinoline hydrochloride [61-25-6].

» Papaverine Hydrochloride contains not less than 98.5 percent and not more than 100.5 percent of C₂₀H₂₁NO₄ · HCl, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

USP Reference standards (11)—

USP Papaverine Hydrochloride RS

Completeness of solution—A 1 in 15 solution in chloroform is clear and free from undissolved solid.

Identification—

A: *Infrared Absorption* (197K).

B: *Ultraviolet Absorption* (197U)—

Solution: 2.5 μg per mL.

Medium: 0.1 N hydrochloric acid.

Absorptivities at 251 nm, calculated on the dried basis, do not differ by more than 3.0%.

C: A solution (1 in 50) responds to the tests for *Chloride* (191).

pH (791): between 3.0 and 4.5, in a solution (1 in 50).

Loss on drying (731)—Dry it at 105° for 2 hours: it loses not more than 0.5% of its weight.

Residue on ignition (281): not more than 0.1%.

Limit of cryptopine, thebaine, or other organic impurities—Dissolve 50 mg in 2 mL of sulfuric acid in a small test tube: the resulting solution is not more yellow-brown in color than *Matching Fluid S* (see *Readily Carbonizable Substances Test* (271)), and it is not more pink than a standard prepared, in equal volume, by diluting 3.0 mL of 0.1 N potassium permanganate with water to 1000 mL.

Assay—Dissolve about 700 mg of Papaverine Hydrochloride, accurately weighed, in 80 mL of glacial acetic acid; add 10 mL of mercuric acetate TS and 1 drop of crystal violet TS; and titrate with 0.1 N perchloric acid VS to a blue-green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 37.59 mg of C₂₀H₂₁NO₄ · HCl.

Papaverine Hydrochloride Injection

» Papaverine Hydrochloride Injection is a sterile solution of Papaverine Hydrochloride in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{20}H_{21}NO_4 \cdot HCl$.

Packaging and storage—Preserve in single-dose or multiple-dose containers, preferably of Type I glass.

USP Reference standards (11)—

USP Endotoxin RS
USP Papaverine Hydrochloride RS

Identification—

A: Add 2 mL of alcohol to 1 mL of Injection, and evaporate on a steam bath, with the aid of a stream of nitrogen, to dryness. Dry the residue at 105° for 2 hours; it responds to *Identification test A* under *Papaverine Hydrochloride*.

B: It responds to *Identification test C* under *Papaverine Hydrochloride*.

Bacterial Endotoxins Test (85)—It contains not more than 2.9 USP Endotoxin Units per mg of papaverine hydrochloride.

pH (791): not less than 3.0.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—Transfer 1.0 mL of Injection to a 200-mL volumetric flask, and dilute with water to volume. Pipet 3 mL of this solution into a separator, add 10 mL of water, and render alkaline with 6 N ammonium hydroxide. Extract the alkaloid with successive 5-mL portions of chloroform, and evaporate the extracts to dryness. Dissolve the residue in 0.1 N hydrochloric acid, and dilute with the same medium to 100.0 mL. Concomitantly determine the absorbances of this solution and of a Standard solution of USP Papaverine Hydrochloride RS in 0.1 N hydrochloric acid having a known concentration of about 4.5 µg per mL in 1-cm cells at the wavelength of maximum absorbance at about 251 nm, with a suitable spectrophotometer, using 0.1 N hydrochloric acid as the blank. Calculate the quantity, in mg, of $C_{20}H_{21}NO_4 \cdot HCl$ in the portion of Injection taken by the formula:

$$6.67C(A_U / A_S)$$

in which *C* is the concentration, in µg per mL, of USP Papaverine Hydrochloride RS in the Standard solution, and A_U and A_S are the absorbances of the solution from the Injection and the Standard solution, respectively.

Papaverine Hydrochloride Tablets

» Papaverine Hydrochloride Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{20}H_{21}NO_4 \cdot HCl$.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Papaverine Hydrochloride RS

Identification—Add a portion of powdered Tablets, equivalent to about 30 mg of papaverine hydrochloride, to 10 mL of 0.1 N hydrochloric acid in a separator. Extract the mixture with 10 mL of chloroform, filter the chloroform phase through paper, evaporate the solvent on a steam bath, and dry the residue at 105° for 2 hours; it responds to *Identification test A* under *Papaverine Hydrochloride*.

Dissolution (711)—

Medium: water; 900 mL.

Apparatus 1: 100 rpm.

Time: 30 minutes.

Procedure—Determine the amount of $C_{20}H_{21}NO_4 \cdot HCl$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 250 nm on filtered portions of the solution under test, suitably diluted with 0.1 N hydrochloric acid, in comparison with a Standard solution having a known concentration of USP Papaverine Hydrochloride RS in the same Medium.

Tolerances—Not less than 80% (*Q*) of the labeled amount of $C_{20}H_{21}NO_4 \cdot HCl$ is dissolved in 30 minutes.

Uniformity of dosage units (905): meet the requirements.

Procedure for content uniformity—Transfer 1 finely powdered Tablet to a 250-mL volumetric flask, add 50 mL of water and 3 mL of hydrochloric acid, mix, and allow to stand for 15 minutes with occasional agitation. Dilute with water to volume, mix, and filter, discarding the first 20 mL of the filtrate. Dilute a portion of the subsequent filtrate quantitatively and stepwise, if necessary, with water to provide a solution containing approximately 2.4 µg of papaverine hydrochloride per mL. Concomitantly determine the absorbances of this solution and a solution of USP Papaverine Hydrochloride RS, in the same medium at a concentration of about 2.4 µg per mL, in 1-cm cells, at the wavelength of maximum absorbance at about 250 nm, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg, of $C_{20}H_{21}NO_4 \cdot HCl$ in the Tablet by the formula:

$$(TC / D)(A_U / A_S)$$

in which *T* is the labeled quantity, in mg, of papaverine hydrochloride in the Tablet; *C* is the concentration, in µg per mL, of USP Papaverine Hydrochloride RS in the Standard solution; *D* is the concentration, in µg per mL, of the solution from the Tablet based upon the labeled quantity per Tablet and the extent of dilution; and A_U and A_S are the absorbances of the solution from the Tablet and the Standard solution, respectively.

Assay—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 30 mg of papaverine hydrochloride, to a glass-stoppered conical flask, add about 100 mL of 0.1 N hydrochloric acid, and shake by mechanical means for 15 minutes. Filter the mixture into a 200-mL volumetric flask, and add 0.1 N hydrochloric acid to volume. Proceed as directed in the *Assay* under *Papaverine Hydrochloride Injection*, beginning with "Pipet 3 mL of this solution into a separator." Calculate the quantity, in mg, of $C_{20}H_{21}NO_4 \cdot HCl$ in the portion of Tablets taken by the formula:

$$6.67C(A_U / A_S)$$

in which *C* is the concentration, in µg per mL, of USP Papaverine Hydrochloride RS in the Standard solution, and A_U and A_S are the absorbances of the solution from the Tablets and the Standard solution, respectively.

Parachlorophenol

C_6H_5ClO
Phenol, 4-chloro-;
p-Chlorophenol [106-48-9].

128.56

DEFINITION

Parachlorophenol contains NLT 99.0% and NMT 100.5% of parachlorophenol (C_6H_5ClO).

IDENTIFICATION

- **A.**
Sample solution: 10 mg/mL of Parachlorophenol
Analysis: Add bromine TS dropwise to the *Sample solution*.
Acceptance criteria: A white precipitate is formed; at first it redissolves, but then it becomes permanent as an excess of the reagent is added.
- **B.**
Sample solution: 10 mg/mL of Parachlorophenol
Analysis: Add 1 drop of ferric chloride TS to 10 mL of *Sample solution*.
Acceptance criteria: The solution acquires a violet-blue color.
- **C.**
Analysis: Heat a few crystals, held on a copper wire, in the edge of a nonluminous flame.
Acceptance criteria: A green color is imparted to the flame.
- **D.**
Sample: 1 g of Parachlorophenol
Analysis: Mix the *Sample* and 5 mL of sodium hydroxide solution (1 in 3), then add 1.5 g of monochloroacetic acid. Shake, and heat on a steam bath for 1 h. Cool, dilute with 15 mL of water, and acidify with hydrochloric acid. Extract with 50 mL of ether, wash the ether solution with 10 mL of cold water, then extract the ether solution with 25 mL of sodium carbonate solution (1 in 20). Acidify the solution with hydrochloric acid, collect the resulting precipitate on a filter, and recrystallize it from hot water.
Acceptance criteria: The resulting parachlorophenoxyacetic acid melts between 154° and 158°.

ASSAY• **PROCEDURE**

Sample: 1 g of Parachlorophenol
Titrimetric system
 (See *Titrimetry* (541).)
Mode: Residual titration
Titrant: 0.1 N bromine VS
Back-titrant: 0.1 N sodium thiosulfate VS
Endpoint detection: Visual
Analysis: Transfer the *Sample* to a 500-mL volumetric flask, and dissolve and dilute with water to volume. Transfer a 25.0-mL portion of the solution to an iodine flask, cool in an ice bath to 4°, and add 20.0 mL of *Titrant*. Add 5 mL of hydrochloric acid, and immediately insert the stopper. Maintain the flask at a temperature of 4° for 30 min, shaking at frequent intervals. Allow it to stand for 15 min, remove the stopper just sufficiently to introduce quickly 5 mL of potassium iodide solution (1 in 5), taking care that no bromine vapor escapes, and at once insert the stopper in the flask. Shake thoroughly, remove the stopper, and rinse it and the neck of the flask with a small portion of water, allowing the washings to flow into the flask. Shake the mixture, and titrate the liberated iodine with *Back-titrant*, using 3 mL of starch TS as the indicator. Perform a blank determination. Each mL of 0.1 N bromine is equivalent to 3.214 mg of parachlorophenol (C_6H_5ClO).
Acceptance criteria: 99.0%–100.5%

IMPURITIES• **LIMIT OF NONVOLATILE RESIDUE**

Sample: 1 g of Parachlorophenol
Analysis: Heat the *Sample* in a tared container on a steam bath until it is volatilized, and dry at 105° for 1 h.

Acceptance criteria: NMT 0.1% of residue remains.

• **LIMIT OF CHLORIDE**

Sample solution: 10 mg/mL of Parachlorophenol
Analysis: Acidify 10 mL of *Sample solution* with 2 N nitric acid, and add a few drops of silver nitrate TS.
Acceptance criteria: No turbidity or opalescence is produced.

SPECIFIC TESTS• **CLARITY AND REACTION OF SOLUTION**

Sample solution: 10 mg/mL of Parachlorophenol
Acceptance criteria: Solution is clear and is acid to litmus.

• **CONGEALING TEMPERATURE (651):** Between 42° and 44°**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

Camphorated Parachlorophenol**DEFINITION**

Camphorated Parachlorophenol is a triturated mixture that contains NLT 33.0% and NMT 37.0% of parachlorophenol (C_6H_5ClO) and NLT 63.0% and NMT 67.0% of camphor ($C_{10}H_{16}O$). The sum of the percentages of parachlorophenol and camphor is NLT 97.0% and NMT 103.0%.

ASSAY• **PARACHLOROPHENOL**

Sample: 1 g
Analysis: Add the *Sample* to a wide-mouth conical flask. Add a few glass beads, 6 mL of sodium hydroxide solution (1 in 2), and 130 mL of water. Heat the solution to boiling, add 70 mL of potassium permanganate solution (3 in 50), and continue to boil for 20 min. To the hot solution add 40 mL of 0.1 N silver nitrate. Add 50 mL of 18 N sulfuric acid, and sodium sulfite crystals, in divided portions and with swirling until the permanganate color is discharged and no manganese dioxide remains. Boil until the vapors are no longer acid to litmus, keeping the volume nearly constant by the addition of water. Add 5 mL of nitric acid, and continue to boil for 5 min. Cool, and collect the precipitate on a tared filtering crucible, wash well with water, then with 10 mL of alcohol. Dry at 105° for 1 h, cool, and weigh. Each 1.000 g of the silver chloride so obtained is equivalent to 897.0 mg of parachlorophenol (C_6H_5ClO).

Acceptance criteria

Parachlorophenol: 33.0%–37.0% of parachlorophenol (C_6H_5ClO)

Total: The sum of the percentages of parachlorophenol and camphor is 97.0%–103.0%.

• **CAMPBOR**

Sample solution: Transfer about 300 mg of Camphorated Parachlorophenol to a 200-mL pressure bottle containing 50 mL of freshly prepared dinitrophenylhydrazine TS.

Analysis: Close the pressure bottle, immerse it in a water bath, and maintain it at about 75° for 4 h. Cool to room temperature, then transfer the contents to a beaker with the aid of 100 mL of 3 N sulfuric acid and allow it to stand overnight. Collect the precipitate on a tared filtering crucible, wash with 100 mL of 3 N sulfuric acid and then with 75 mL of cold water, in divided portions, to remove the acid. Dry at 80° for 2 h, cool, and weigh. The weight of the precipitate so obtained, multiplied by 0.4581, represents the weight of camphor ($C_{10}H_{16}O$) in the sample taken.

Acceptance criteria

Camphor: 63.0%–67.0% of camphor ($C_{10}H_{16}O$)

Total: The sum of the percentages of parachlorophenol and camphor is 97.0%–103.0%.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

Paraldehyde

$C_6H_{12}O_3$ 132.16

1,3,5-Trioxane, 2,4,6-trimethyl-
2,4,6-Trimethyl-s-trioxane [123-63-7].

» **NOTE**—Paraldehyde is subject to oxidation to form acetic acid. It may contain a suitable stabilizer.

Packaging and storage—Preserve in well-filled, tight, light-resistant containers, preferably of Type I or Type II glass, holding not more than 30 mL, at a temperature not exceeding 25°. Paraldehyde may be shipped in bulk containers holding a minimum of 22.5 kg (50 lb) to commercial drug repackagers only.

Labeling—The label of all containers of Paraldehyde, including those dispensed by the pharmacist, includes a statement directing the user to discard the unused contents of any container that has been opened for more than 24 hours.

NOTE—The label of bulk containers of Paraldehyde directs the commercial drug repackager to demonstrate compliance with the USP purity tests for Paraldehyde immediately prior to repackaging, and not to repackage from a container that has been opened longer than 24 hours.

Identification—Heat it with a small quantity of 2 N sulfuric acid: acetaldehyde, recognizable by its pungent odor, is produced.

Congeeing temperature (651): not lower than 11°.

Distilling range, Method I (721)—It distills completely between 120° and 126°, a correction factor of 0.050° per mm being applied as necessary.

Acidity—To a solution of 6.0 mL in 100 mL of water add 5 drops of phenolphthalein TS, and titrate with 1.0 N sodium hydroxide: not more than 0.50 mL is required to produce a pink color (0.5% as acetic acid).

Chloride—To 5 mL of a solution (1 in 10) add 1 drop of nitric acid and 3 drops of silver nitrate TS: no opalescence is produced immediately.

Sulfate—To 5 mL of a solution (1 in 10) add 1 drop of hydrochloric acid and 3 drops of barium chloride TS: no turbidity is produced.

Limit of nonvolatile residue—Heat 5.0 mL in a small, tared evaporating dish on a steam bath: no disagreeable odor is noticeable as the last portions evaporate, and, when dried at 105° for 1 hour, not more than 3 mg of residue remains (0.06%).

Limit of acetaldehyde—Place 100 mL of water in a 250-mL conical flask, add 5.0 mL of Paraldehyde, and shake the mixture gently until solution is complete. Add 5 mL of hydroxylamine hydrochloride solution (3.5 in 100). Shake the mixture gently for 30 seconds, add methyl orange TS, and titrate immediately with 0.50 N sodium hydroxide. Per-

form a blank titration: the difference between the titers does not exceed 1 mL of 0.50 N sodium hydroxide (0.4%).

Paregoric**DEFINITION**

Paregoric contains NLT 35 mg and NMT 45 mg of anhydrous morphine in each 100 mL.

Prepare Paregoric as follows.

Powdered Opium	4.3 g
Suitable Essential Oil(s)	—
Benzoic Acid	3.8 g
Diluted Alcohol	900 mL
Glycerin	38 mL
To make	950 mL

Prepare a diluted alcohol mixture containing 400 mg of *Benzoic Acid*, 4 mL of *Glycerin*, and sufficient *Suitable Essential Oil(s)* in each 100 mL of *Diluted Alcohol*. Separately, macerate the *Powdered Opium*, *Benzoic Acid*, and *Suitable Essential Oil(s)* for 5 days, with occasional agitation, in a mixture of *Diluted Alcohol* and *Glycerin*. Then filter, and pass enough *Diluted Alcohol* through the filter to obtain 950 mL of total filtrate. Assay a portion of this filtrate as directed herein, and dilute the remainder with a sufficient quantity of the previously prepared diluted alcohol mixture to yield a solution containing 40 mg of anhydrous morphine in each 100 mL.

Paregoric may also be prepared by using *Opium* or *Opium Tincture* instead of *Powdered Opium*, the anhydrous morphine content being adjusted to 40 mg in each 100 mL and the alcohol content being adjusted to 45%.

ASSAY**• PROCEDURE**

Mobile phase A: 1-in-5 solution of triethylamine in water-saturated chloroform

Mobile phase B: 1-in-100 solution of triethylamine in water-saturated chloroform

Chromatographic tubes: Prepare three similar tubes, each about 260 mm long and consisting of about 200 mm of 25-mm tubing and about 6 cm of 6-mm tubing. In each of the tubes, place a pledget of glass wool at a point where the 6-mm tubing is constricted slightly, about 2 cm from the junction.

Citrate buffer: 0.1 M sodium citrate and 0.1 M citric acid (50:50)

Standard solution: Dissolve a quantity of USP Morphine Sulfate RS equivalent to about 40 mg of anhydrous morphine in 0.5 mL of triethylamine contained in a 100-mL volumetric flask, and add methanol to volume. Pipet 10 mL of this solution into a 50-mL volumetric flask, add 1 mL of triethylamine and 1 mL of hydrochloric acid, and add water-saturated chloroform to volume.

Sample solution: Evaporate 10.0 mL of Paregoric (equivalent to about 4 mg of morphine) on a steam bath under a stream of air to about 2 mL, and cool. [NOTE—Avoid reducing the volume to less than 2 mL.] Add 0.5 mL of *Citrate buffer*.

Chromatographic columns: Fill the three tubes with adsorbent prepared as follows, using chromatographic siliceous earth as the base of the adsorbent, and tamp it firmly in place. After filling, place a small pad of glass wool above each column packing.

Column 1: Pack in two layers, the lower layer consisting of 3 g of chromatographic siliceous earth mixed with 2 mL of *Citrate buffer* and the upper layer of 3 g of chromatographic siliceous earth mixed with the *Sample solution*. Dry-rinse the beaker in which the

components of the two layers have been mixed with 1 g of chromatographic siliceous earth, and add it also to the top of the column.

Column II: Pack with 3 g of chromatographic siliceous earth mixed with 2 mL of dibasic potassium phosphate solution (1 in 5.75).

Column III: Pack with 3 g of chromatographic siliceous earth mixed with 2 mL of sodium hydroxide solution (1 in 50).

Instrumental conditions

Mode: UV-Vis

Analytical wavelength: 255–360 nm

Cell: 1 cm

Blank: Chloroform

Analysis

[NOTE—(1) Use water-saturated solvents throughout this procedure; (2) prepare eluants fresh daily; and (3) avoid bringing the solutions into contact with metal.]

Wash *Column I* with 100 mL of ether, followed by 100 mL of chloroform. Rinse the tip of the column with chloroform, and discard the solvents. In the following operations, rinse each column tip before discarding the column or changing receivers.

Mount the three columns vertically so that the effluent from *Column I* flows into *Column II*, and the effluent from the latter flows into *Column III*. Pass through the three columns 5 mL of *Mobile phase A*, followed by four 10-mL portions of *Mobile phase B*, allowing each portion to pass through completely before subsequent additions. Discard *Column I*.

Pass three 5-mL portions of *Mobile phase B* through the two remaining columns. Discard *Column II*.

Wash *Column III* successively with 10 mL of *Mobile phase B*, 50 mL of chloroform, 2 mL of a 1-in-10 solution of glacial acetic acid in chloroform, and 50 mL of a 1-in-100 solution of glacial acetic acid in chloroform. Discard all washings. Arrange to collect eluate from *Column III* in a 50-mL volumetric flask containing 10 mL of methanol and 1 mL of hydrochloric acid. Elute the column with 5 mL of *Mobile phase A*, followed by 33 mL of *Mobile phase B*. Dilute with chloroform to volume, and mix.

Concomitantly record the spectra of this solution and the *Standard solution*, and plot the corresponding wavelength-absorbance curves. Correct the absorbance of each solution, at the wavelength of maximum absorbance at about 285 nm, by extrapolating the portion of the base-line curve between 340 and 310 nm to this wavelength.

Calculate the weight of anhydrous morphine, in mg, in 100 mL of Paregoric taken:

$$\text{Result} = (A_U/A_S) \times W \times F$$

A_U = corrected absorbance of the *Sample solution*

A_S = corrected absorbance of the *Standard solution*

W = weight of anhydrous morphine in the 50 mL of *Standard solution* (mg)

F = dilution factor, 10

Acceptance criteria: 35–45 mg of anhydrous morphine per 100 mL of Paregoric

OTHER COMPONENTS

- **ALCOHOL DETERMINATION, Method II (611):** 43.0%–47.0% of C_2H_5OH , using acetone as the internal standard

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers, and avoid exposure to direct sunlight and to excessive heat.

• USP REFERENCE STANDARDS (11)

USP Morphine Sulfate RS

Paricalcitol

$C_{27}H_{44}O_3$

416.64

19-Nor-1- α ,25-dihydroxyvitamin D_2 ;

(1 α ,3 β ,7 E ,22 E)-19-Nor-9,10-secoergosta-5,7,22-triene-1,3,25-triol;

(7 E ,22 E)-19-Nor-9,10-secoergosta-5,7,22-triene-1 α ,3 β ,25-triol [131918-61-1].

DEFINITION

Paricalcitol contains NLT 97.0% and NMT 103.0% of paricalcitol ($C_{27}H_{44}O_3$), calculated on the dried basis.

[CAUTION—Handle Paricalcitol with exceptional care because it is very potent. Care should be taken to prevent inhaling particles of Paricalcitol and exposing the skin to it.]

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• PROCEDURE

[NOTE—Protect paricalcitol solutions from light.]

Mobile phase: Methanol and water (4:1)

Diluent: Methanol and water (1:1)

Standard solution: Dilute USP Paricalcitol Solution RS with *Diluent* to obtain a solution containing 5.0 $\mu\text{g/mL}$ of paricalcitol.

Sample solution: Transfer an accurately weighed amount of Paricalcitol to a suitable volumetric flask, add dehydrated alcohol (approximately 1 mL of dehydrated alcohol per each 0.5 mg of paricalcitol), sonicate to dissolve, and dilute with *Diluent* to volume. Further dilute this solution with *Diluent* to obtain a solution containing 5.0 $\mu\text{g/mL}$ of paricalcitol.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 252 nm

Column: 4.6-mm \times 25-cm; 5- μm packing L1

Flow rate: 2 mL/min

Injection volume: 100 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 1.0%

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of paricalcitol ($C_{27}H_{44}O_3$) in the portion of Paricalcitol taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of paricalcitol in the *Standard solution* ($\mu\text{g/mL}$)

C_U = concentration of Paricalcitol in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 97.0%–103.0% on the dried basis

IMPURITIES

• ORGANIC IMPURITIES

[NOTE—Unless otherwise specified, protect paricalcitol solutions from light.]

Diluent: Dehydrated alcohol and water (50:50)

Solution A: Acetonitrile and water (5:95)

Solution B: Acetonitrile and methanol (75:25)

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	42	58
11 ^a	42	58
20	0	100
27	0	100
27.1	42	58
30	42	58

^a Determine the retention time of the paricalcitol peak using the *Standard solution*. Adjust the start of the gradient to be 1.0 ± 0.1 min prior to the retention time of paricalcitol and accordingly adjust the remaining gradient times.

System suitability stock solution: Prepare a 50- $\mu\text{g/mL}$ solution of paricalcitol from USP Paricalcitol Solution RS in dehydrated alcohol. Using a colorless glass container, expose the solution to ultraviolet light at 254 nm. Paricalcitol undergoes partial degradation to 7Z-paricalcitol. A degradation of at least 0.2% of paricalcitol to 7Z-paricalcitol [(7Z,22E)-19-nor-9,10-secoergosta-5,7,22-triene-1 α ,3 β ,25-triol] must be obtained, based on the corresponding peaks. If it is not obtained, expose the solution to ultraviolet light again.

System suitability solution: *System suitability stock solution* and water (1:1)

Standard stock solution: 5 $\mu\text{g/mL}$ of paricalcitol from USP Paricalcitol Solution RS in *Diluent*

Standard solution: 0.15 $\mu\text{g/mL}$ of paricalcitol from *Standard stock solution* in *Diluent*

Sensitivity solution: 0.05 $\mu\text{g/mL}$ of paricalcitol from *Standard solution* in *Diluent*

Sample stock solution: 200 $\mu\text{g/mL}$ of Paricalcitol in dehydrated alcohol

Sample solution: 100 $\mu\text{g/mL}$ of Paricalcitol from *Sample stock solution* in water

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 252 nm

Column: 4.6-mm \times 10-cm; 2.7- μm packing L1

Column temperature: 30°

Flow rate: 0.9 mL/min

Injection volume: 25 μL

System suitability

Samples: *System suitability solution*, *Standard solution*, and *Sensitivity solution*

[NOTE—The relative retention times for paricalcitol and 7Z-paricalcitol are 1.0 and 1.06, respectively.]

Suitability requirements

Resolution: NLT 1.5 between paricalcitol and 7Z-paricalcitol, *System suitability solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Paricalcitol taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of paricalcitol from the *Standard solution*

C_S = concentration of paricalcitol in the *Standard solution* ($\mu\text{g/mL}$)

C_U = concentration of Paricalcitol in the *Sample solution* ($\mu\text{g/mL}$)

F = relative response factor (see Table 2)

Acceptance criteria: See Table 2. Disregard peaks less than 0.05%.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Paricalcitol	1.0	—	—
22Z-Paricalcitol ^a	1.23	0.64	0.15
Any other individual impurity	—	1.0	0.1
Total impurities	—	—	0.5

^a (7E,22Z)-19-Nor-9,10-secoergosta-5,7,22-triene-1 α ,3 β ,25-triol.

SPECIFIC TESTS

• LOSS ON DRYING

(See *Thermal Analysis* (891).)

Sample: 8 mg of Paricalcitol

Analysis: Determine the percentage of volatile substances by thermogravimetric analysis on an appropriately calibrated instrument. Heat at a rate of 5°/min between ambient temperature and 150° in an atmosphere of nitrogen at a flow rate of 40 mL/min. Determine the accumulated loss in weight from the thermogram.

Acceptance criteria: NMT 2.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store under argon in a freezer.

• **USP REFERENCE STANDARDS (11)**

USP Paricalcitol RS

USP Paricalcitol Solution RS

Paricalcitol Injection

DEFINITION

Paricalcitol Injection is a sterile solution of Paricalcitol in a mixture of Water for Injection, Propylene Glycol, and Alcohol, or other suitable solvents. It contains NLT 90.0% and NMT 110.0% of the labeled amount of paricalcitol ($\text{C}_{27}\text{H}_{44}\text{O}_3$).

IDENTIFICATION

• **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY**• PROCEDURE**

[NOTE—Protect paricalcitol solutions from light.]

Mobile phase: Methanol and water (4:1)

Diluent: Methanol and water (1:1)

Standard solution: Dilute USP Paricalcitol Solution RS with *Diluent* to obtain a solution having a concentration of paricalcitol similar to that of the Injection.

Sample solution: Use the Injection.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 252 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 2 mL/min

Injection volume: 100–200 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of paricalcitol ($C_{27}H_{44}O_3$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of paricalcitol in the *Standard solution*, calculated on the basis of the content of paricalcitol in the USP Paricalcitol Solution RS (μg/mL)

C_U = nominal concentration of paricalcitol in the *Sample solution* (μg/mL)

Acceptance criteria: 90.0%–110.0%

OTHER COMPONENTS**• CONTENT OF PROPYLENE GLYCOL AND ALCOHOL (if present)**

Mobile phase: 0.01 N sulfuric acid solution, filtered and degassed

Alcohol stock solution: Transfer 2.0 mL of dehydrated alcohol to a 10-mL volumetric flask, and dilute with water to volume.

Propylene glycol stock solution: Transfer 3.0 mL of propylene glycol to a 10-mL volumetric flask, and dilute with water to volume.

Standard solution: Transfer 5.0 mL each of *Alcohol stock solution* and *Propylene glycol stock solution* to a 50-mL volumetric flask, and dilute with water to volume.

Sample solution: Transfer 5.0 mL of Injection to a 50-mL volumetric flask, and dilute with water to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Refractive index

Column: 7.8-mm × 30-cm; packing L17

Column temperature: 60°

Flow rate: 0.8 mL/min

Injection volume: 10 μL

System suitability

Sample: *Standard solution*

[NOTE—Elution order is propylene glycol followed by alcohol.]

Suitability requirements

Resolution: NLT 4.0 between propylene glycol and alcohol

Relative standard deviation: NMT 2.0% for each peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amounts of propylene glycol and alcohol in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of alcohol or propylene glycol from the *Sample solution*

r_S = peak response of alcohol or propylene glycol from the *Standard solution*

C_S = concentration of alcohol or propylene glycol in the *Alcohol stock solution* or *Propylene glycol stock solution* (% v/v)

C_U = nominal concentration of alcohol or propylene glycol (if present) in the Injection (% v/v)

Acceptance criteria

Alcohol: 80.0%–120.0%

Propylene glycol: 80.0%–120.0%

IMPURITIES**• ALUMINUM (206)**

Diluent: Dilute 4 mL of nitric acid with water to 2000 mL.

Matrix modifier: 1.5 mg/mL of magnesium nitrate

Standard stock solution: Proceed as directed for *Standard preparations* in the chapter, beginning with "Treat some aluminum wire" and ending with "Cool, and transfer the solution, with the aid of water, to a 100-mL volumetric flask, and dilute with water to volume". Transfer 2 mL of this solution to a second 100-mL volumetric flask, and dilute with water to volume. Transfer 2 mL of this solution to a third 100-mL volumetric flask, and dilute with water to volume. This solution contains 0.4 μg/mL of aluminum.

Standard solution A: 2.5 ng/mL of aluminum in *Diluent*, from the *Standard stock solution*

Standard solution B: 5.0 ng/mL of aluminum in *Diluent*, from the *Standard stock solution*

Standard solution C: 10 ng/mL of aluminum in *Diluent*, from the *Standard stock solution*

Standard solution D: 20 ng/mL of aluminum in *Diluent*, from the *Standard stock solution*

Standard solution E: 50 ng/mL of aluminum in *Diluent*, from the *Standard stock solution*

Sample solution: Dilute 4.0 mL of Injection with 6.0 mL of *Diluent*, or use an appropriate dilution to obtain a solution having a concentration of NMT 0.02 μg/mL of aluminum.

System suitability solution: Dilute 9.5 mL of the *Sample solution* with 0.5 mL of the *Standard stock solution*. If the resulting solution contains more than 0.04 μg/mL of aluminum, prepare an alternate dilution having a concentration of about 0.02–0.04 μg/mL of aluminum.

Instrumental conditions

(See *Atomic Absorption Spectroscopy* (852).)

Mode: Atomic absorption spectrophotometry; instrument equipped with a flameless, electrically heated furnace

Lamp: Aluminum hollow-cathode

Analytical wavelength: Aluminum emission line at 309.3 nm

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, *Standard solution D*, *Standard solution E*, *Sample solution*, and *System suitability solution*
Under typical conditions, the sample volume is 20 μL, the volume of the *Matrix modifier* is 5 μL, the injection temperature is 100°, and the oven conditions are as listed in *Table 1*. [NOTE—These conditions may be optimized for each instrument.]

Table 1

Step	Temperature
Drying 1	110°
Drying 2	130°
Drying 3	200°
Pyrrolysis	1100°
Read	2300°
Clean out	2450°

Determine the absorbances of the samples. Plot the absorbances of the *Standard solutions* versus the content of aluminum, in ng/mL, drawing a straight line best fitting the five points. The correlation coefficient is NLT 0.995, the recovery for the *System suitability solution* is 80%–120%, and the duplicate injections must agree within 0.0024 µg/mL. From the graph so obtained, determine the quantity of aluminum, C, in µg, found in each mL of the *Sample solution*. Calculate the quantity, in µg/mL, of aluminum in the portion of Injection taken:

$$\text{Result} = C \times D$$

C = measured concentration of aluminum in the *Sample solution* (µg/mL)

D = dilution factor used to prepare the *Sample solution*

Acceptance criteria: NMT 0.5 µg/mL

• ORGANIC IMPURITIES

Diluent: Acetonitrile and water (1:1)

Solution A: Acetonitrile and water (15:85)

Solution B: Acetonitrile

Mobile phase: See Table 2.

Table 2

Time (min)	Solution A (%)	Solution B (%)
0	65	35
25	5	95
45	5	95

Return to the original conditions, and re-equilibrate the system.

Standard solution: Dilute USP Paricalcitol Solution RS with *Diluent* to obtain a solution having a concentration of paricalcitol equal to 0.5% of the labeled concentration of the Injection.

Degradation stock solution: Dilute 1 mL of USP Paricalcitol Solution RS with *Diluent* to 5 mL.

Degradation solution A: Transfer 1 mL of the *Degradation stock solution* and 0.1 mL of 30% hydrogen peroxide into a 10-mL container, and allow to stand at room temperature for 1 h. Dilute with *Diluent* to 10 mL, and mix.

Degradation solution B: Mix 1 mL of the *Degradation stock solution* and 1 mL of 0.1 N hydrochloric acid, and heat at 70° for 1 h. Cool to room temperature, dilute with *Diluent* to 10 mL, and mix.

Sample solution: Use the Injection.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 252 nm

Columns

Guard: 4.6-mm × 7.5-mm; packing L1

Analytical: 4.6-mm × 25-cm; 5-µm packing L1

Flow rate: 1 mL/min

Injection volume: 100–200 µL

System suitability

Samples: *Standard solution* and *Degradation solution B*

Suitability requirements

Resolution: NLT 1.0 between the paricalcitol peak and the related compound D peak, *Degradation solution B*

Relative standard deviation: NMT 5.0%, *Standard solution*

Analysis

Samples: *Diluent*, *Degradation solution A*, *Degradation solution B*, *Standard solution*, and *Sample solution*

Identify the impurities in the *Sample solution* on the basis of the relative retention times of the components of *Degradation solution A* and *Degradation solution B* in Table 3.

Table 3

Name ^a	Degradation Solution	Relative Retention Time	Acceptance Criteria, NMT (%)
Related compound A	A	0.63	1.0
Related compound B	A	0.79	1.0
Related compound C	B	0.89	1.0
Related compound D	B	0.95	1.0
Related compound E ^b	B	1.32	1.0
Related compound F	B	1.57	1.0
Related compound G	B	1.66	1.0
Related compound H	B	1.74	1.0
Related compound I	B	1.79	1.0
Total impurities	—	—	2.0

^a Related compounds A–I are specified unidentified degradation products. No information is available about chemical structures or chemical names for these impurities.

^b This peak is very small; the signal-to-noise ratio is approximately 3–5.

Calculate the percentage of each impurity in the portion of Injection taken:

$$\text{Result} = (r_u/r_s) \times C_s \times (100/L)$$

r_u = peak response of each impurity from the *Sample solution*

r_s = peak response of paricalcitol from the *Standard solution*

C_s = concentration of paricalcitol in the *Standard solution*, calculated on the basis of the content of paricalcitol in the USP Paricalcitol Solution RS (µg/mL)

L = labeled amount of paricalcitol in the Injection (µg/mL)

Acceptance criteria: See Table 3. Disregard any peak observed in the *Diluent*.

SPECIFIC TESTS

- **BACTERIAL ENDOTOXINS TEST (85):** It contains NMT 10 USP Endotoxin Units/µg of paricalcitol.
- **PARTICULATE MATTER IN INJECTIONS (788):** Meets the requirements for small-volume injections
- **OTHER REQUIREMENTS:** It meets the requirements under *Injections and Implanted Drug Products* (1).

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose or multi-dose containers, preferably of Type I glass. Store at controlled room temperature.

- **USP REFERENCE STANDARDS** (11)
USP Endotoxin RS
USP Paricalcitol Solution RS

Paromomycin Sulfate

$C_{23}H_{45}N_5O_{14} \cdot xH_2SO_4$

D-Streptamine, [O-2-amino-2-deoxy- α -D-glucopyranosyl-(1 \rightarrow 4)-O-[O-2,6-diamino-2,6-dideoxy- β -L-idopyranosyl-(1 \rightarrow 3)- β -D-ribofuranosyl-(1 \rightarrow 5)]-2-deoxy-, sulfate (salt).
O-2,6-Diamino-2,6-dideoxy- β -L-idopyranosyl-(1 \rightarrow 3)-O- β -D-ribofuranosyl-(1 \rightarrow 5)-O-[2-amino-2-deoxy- α -D-glucopyranosyl-(1 \rightarrow 4)]-2-deoxystreptamine sulfate (salt) [1263-89-4].

Base 615.63 [59-04-1; 7542-37-2].

» Paromomycin Sulfate is the sulfate salt of an antibiotic substance or substances produced by the growth of *Streptomyces rimosus* var. *paromomycinus*, or a mixture of two or more such salts. It has a potency equivalent to not less than 675 μ g of paromomycin ($C_{23}H_{45}N_5O_{14}$) per mg, calculated on the dried basis.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Paromomycin Sulfate RS

Identification—

A: Prepare a test solution in water containing 10 mg of paromomycin per mL. Apply 25 μ L of this solution and 25 μ L of a Standard solution of USP Paromomycin Sulfate RS containing 10 mg of paromomycin per mL to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel. Allow the spots to dry, place the plate in a developing chamber, and develop the chromatogram in a solvent system consisting of a mixture of freshly prepared ammonium acetate solution (4 in 100), *n*-propyl alcohol, and ammonium hydroxide (30:10:6) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow it to air-dry for 10 minutes. Heat the plate at 105° for 1 hour, allow to cool, and spray with a solution of ninhydrin in butanol (1 in 100). Heat the plate at 105° for 5 minutes: paromomycin appears as a red spot, and the R_f value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

B: It meets the requirements of the tests for *Sulfate* (191).

Specific rotation (781S): between +50° and +55°.

Test solution: 50 mg per mL, in water.

pH (791): between 5.0 and 7.5, in a solution (3 in 100).

Loss on drying (731)—Dry about 100 mg in a capillary-stoppered bottle in vacuum at a pressure not exceeding

5 mm of mercury at 60° for 3 hours: it loses not more than 5.0% of its weight.

Residue on ignition (281): not more than 2.0%, the charred residue being moistened with 2 mL of nitric acid and 5 drops of sulfuric acid.

Assay—Proceed with Paromomycin Sulfate as directed under *Antibiotics—Microbial Assays* (81).

Paromomycin Sulfate Capsules

» Paromomycin Sulfate Capsules contain the equivalent of not less than 90.0 percent and not more than 125.0 percent of the labeled amount of paromomycin ($C_{23}H_{45}N_5O_{14}$).

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Paromomycin Sulfate RS

Identification—Mix the contents of 1 Capsule with water to obtain a solution containing the equivalent of about 20 mg of paromomycin per mL. This test solution responds to the *Identification* test under *Paromomycin Sulfate*.

Disintegration (701): 15 minutes, the use of disks being omitted.

Uniformity of dosage units (905): meet the requirements.

Loss on drying (731)—Dry about 100 mg in a capillary-stoppered bottle in vacuum at 60° for 3 hours: it loses not more than 7.0% of its weight.

Change to read:

Assay—Proceed with Capsules as directed under *Antibiotics—Microbial Assays* (81), blending not less than 5 Capsules for 5 minutes in a high-speed blender with sufficient *Buffer B.3* (CN 1-May-2017) to obtain a stock solution of convenient concentration. Dilute this stock solution quantitatively with the same buffer to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

Paromomycin Oral Solution

» Paromomycin Oral Solution contains an amount of Paromomycin Sulfate equivalent to not less than 90.0 percent and not more than 130.0 percent of the labeled amount of paromomycin ($C_{23}H_{45}N_5O_{14}$). It may contain one or more suitable buffers, colors, flavors, preservatives, and solvents.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Paromomycin Sulfate RS

Uniformity of dosage units (905)—

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

Deliverable volume (698): meets the requirements.
pH (791): between 7.5 and 8.5.

Change to read:

Assay—Proceed with Oral Solution as directed under *Antibiotics—Microbial Assays* (81), diluting an accurately measured volume of Oral Solution with **Buffer B.3** (CN 1-May-2017) to yield a stock solution of convenient concentration. Quantitatively dilute this stock solution with the same buffer to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

Paroxetine Hydrochloride

$C_{19}H_{20}FNO_3 \cdot HCl$ 365.83
 Hemihydrate 374.83
 Piperidine, 3-[(1,3-benzodioxol-5-yl)oxy)methyl]-4-(4-fluorophenyl)-, hydrochloride, (3*S*-trans)-; (-)-(3*S*,4*R*)-4-(*p*-Fluorophenyl)-3-[(3,4-methylenedioxy)phenoxy)methyl]piperidine hydrochloride [78246-49-8].

DEFINITION

Paroxetine Hydrochloride is anhydrous or contains one-half molecule of water of hydration. It contains NLT 98.5% and NMT 102.0% of paroxetine hydrochloride ($C_{19}H_{20}FNO_3 \cdot HCl$), calculated on the anhydrous and solvent-free basis.

IDENTIFICATION

- A. INFRARED ABSORPTION** (197M)
Standard: Dissolve USP Paroxetine Hydrochloride RS in a mixture of water and isopropyl alcohol (1 in 10). Heat to 70° to dissolve, recrystallize, and dry the residue under vacuum at 50° for 3 h.
Sample: Dissolve Paroxetine Hydrochloride in a mixture of water and isopropyl alcohol (1 in 10). Heat to 70° to dissolve, recrystallize, and dry the residue under vacuum at 50° for 3 h.
Acceptance criteria: Meets the requirements
- B. IDENTIFICATION TESTS—GENERAL, Chloride** (191)
Sample solution: 10 mg/mL of Paroxetine Hydrochloride in methanol and water (1:1)
Acceptance criteria: Meets the requirements

ASSAY

- PROCEDURE**
Buffer: 0.05 M ammonium acetate in water. Adjust with glacial acetic acid to a pH of 4.5.
Mobile phase: Acetonitrile, *Buffer*, and triethylamine (30:70:1). [NOTE—The ratio for acetonitrile, *Buffer*, and triethylamine may be varied between 25:75:1 and 40:70:1 to meet system suitability requirements.] Adjust with glacial acetic acid to a pH of 5.5.
System suitability solution: 0.5 mg/mL each of USP Paroxetine Hydrochloride RS and USP Paroxetine Related Compound B RS
Standard solution: 0.5 mg/mL of USP Paroxetine Hydrochloride RS
Sample solution: 0.5 mg/mL of Paroxetine Hydrochloride

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 295 nm

Column: 4.6-mm × 25-cm; packing L13

Flow rate: 1 mL/min

Injection volume: 10 µL

System suitability

Sample: *System suitability solution*

[NOTE—The approximate relative retention times for paroxetine related compound B and paroxetine are about 0.9 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between paroxetine related compound B and paroxetine

Tailing factor: NMT 2.0 for paroxetine

Relative standard deviation: NMT 2.0% for paroxetine

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of paroxetine hydrochloride ($C_{19}H_{20}FNO_3 \cdot HCl$) in the portion of Paroxetine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
 r_S = peak response from the *Standard solution*
 C_S = concentration of the *Standard solution* (mg/mL)

C_U = concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 98.5%–102.0% on the anhydrous and solvent-free basis

IMPURITIES

- RESIDUE ON IGNITION** (281): NMT 0.1%

Delete the following:

- HEAVY METALS, Method II** (231): NMT 20 ppm (Official 1-Jan-2018)

LIMIT OF PAROXETINE RELATED COMPOUND C

Mobile phase: *n*-Hexane, absolute alcohol, trifluoroacetic acid, and water (900:100:2:2)

Diluent: *n*-Hexane and absolute alcohol (1:1)

System suitability solution: 0.1 mg/mL each of Paroxetine Hydrochloride and USP Paroxetine Related Compound C RS in *Diluent*

Standard solution: 0.1 mg/mL of USP Paroxetine Related Compound C RS in *Diluent*

Sample solution: 5 mg/mL of Paroxetine Hydrochloride in *Diluent*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 295 nm

Column: 4.6-mm × 25-cm; packing L51

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 5 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for paroxetine related compound C and paroxetine are about 0.6 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between paroxetine and paroxetine related compound C, *System suitability solution*

Tailing factor: NMT 2.5 for the paroxetine related compound C peak, *System suitability solution*

Relative standard deviation: NMT 10.0% for paroxetine related compound C, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of paroxetine related compound C in the portion of Paroxetine Hydrochloride taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response from the *Sample solution*
 r_s = peak response from the *Standard solution*
 C_s = concentration of paroxetine related compound C in the *Standard solution* (mg/mL)
 C_u = concentration of Paroxetine Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 0.1% of paroxetine related compound C

• **LIMIT OF 1-METHYL-4-(p-FLUOROPHENYL)-1,2,3,6-TETRAHYDROPYRIDINE**

Solution A: Dissolve 30 g of sodium perchlorate in 900 mL of water. Add 3.5 mL of phosphoric acid and 2.4 mL of triethylamine. Dilute with water to 1000 mL. Adjust with phosphoric acid or triethylamine to a pH of 2.0.

Solution B: Acetonitrile

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	85	15
20	80	20
27	55	45
36	55	45
38	85	15
45	85	15

Diluent: Acetonitrile and water (1:4)

Standard solution: 42 ng/mL of 1-methyl-4-(p-fluorophenyl)-1,2,3,6-tetrahydropyridine, obtained from USP Paroxetine Related Compound E Mixture RS, in *Diluent*

Sample solution: 42 mg/mL of Paroxetine Hydrochloride in *Diluent*. Sonicate as needed to aid dissolution.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 242 nm

Column: 4.0-mm × 25-cm; packing L1

Column temperature: 30°

Flow rate: 1.5 mL/min

Injection volume: 75 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for 1-methyl-4-(p-fluorophenyl)-1,2,3,6-tetrahydropyridine and paroxetine are about 0.6 and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 15.0% for 1-methyl-4-(p-fluorophenyl)-1,2,3,6-tetrahydropyridine, determined from three replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of 1-methyl-4-(p-fluorophenyl)-1,2,3,6-tetrahydropyridine in the portion of Paroxetine Hydrochloride taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times I \times 100$$

r_u = peak response from the *Sample solution*
 r_s = peak response from the *Standard solution*

C_s = concentration of USP Paroxetine Related Compound E Mixture RS in the *Standard solution* (mg/mL)

C_u = concentration of paroxetine in the *Sample solution* (mg/mL)

I = fraction of 1-methyl-4-(p-fluorophenyl)-1,2,3,6-tetrahydropyridine in the USP Paroxetine Related Compound E Mixture RS

Acceptance criteria: NMT 0.0001%

• **ORGANIC IMPURITIES, PROCEDURE 1**

Perform either *Organic Impurities, Procedure 1* or *Organic Impurities, Procedure 2*, depending on the synthetic route. *Organic Impurities, Procedure 2* is recommended if paroxetine related compound F or G are potential impurities.

Solution A: Tetrahydrofuran, water, and trifluoroacetic acid (20:180:1)

Solution B: Acetonitrile, tetrahydrofuran, and trifluoroacetic acid (180:20:1)

Mobile phase: See Table 2.

Table 2

Time (min)	Solution A (%)	Solution B (%)
0	80	20
30	80	20
50	20	80
60	20	80
70	80	20

Diluent: Tetrahydrofuran and water (1:9)

System suitability solution: 1 mg/mL of USP Paroxetine System Suitability Mixture A RS in *Diluent*. Sonication may be necessary to achieve complete dissolution.

Standard solution: 0.001 mg/mL of USP Paroxetine Hydrochloride RS in *Diluent*

Sample solution: 1 mg/mL of Paroxetine Hydrochloride in *Diluent*. Sonicate to dissolve.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 285 nm

Column: 4.6-mm × 25-cm; packing L7

Column temperature: 40°

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitability

Sample: *System suitability solution*

[NOTE—Identify the peaks using the relative retention times given in Table 3.]

Suitability requirements

Resolution: NLT 2.0 between paroxetine related compound A and paroxetine related compound B

Tailing factor: 0.8–2.0 for paroxetine related compound A

Relative standard deviation: NMT 2.0% for paroxetine related compound A

Analysis

Samples: *Diluent*, *Standard solution*, and *Sample solution*

Calculate the percentage of each impurity in the portion of Paroxetine Hydrochloride taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak area of each impurity from the *Sample solution*, excluding peaks obtained from the chromatogram of the *Diluent*

r_s = peak area of paroxetine from the *Standard solution*

C_s = concentration of USP Paroxetine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = concentration of Paroxetine Hydrochloride, on the anhydrous basis, in the *Sample solution* (mg/mL)

Acceptance criteria: See Table 3.

Table 3

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Paroxetine related compound A	0.66	0.1
Paroxetine related compound B	0.73	0.3
Paroxetine	1.0	—
Any unspecified impurity	—	0.1
Total impurities	—	1.0

• ORGANIC IMPURITIES, PROCEDURE 2

Buffer: Dissolve 3.4 g of monobasic potassium phosphate and 3.4 g of tetrabutylammonium hydrogen sulfate in 1.0 L of water.

Solution A: Acetonitrile and *Buffer* (2:98)

Solution B: Acetonitrile and *Buffer* (40:60)

Mobile phase: See Table 4.

Table 4

Time (min)	Solution A (%)	Solution B (%)
0	100	0
5	100	0
70	40	60
90	0	100
95	0	100
95.1	100	0
110	100	0

Diluent: Acetonitrile and *Buffer* (10:90)

System suitability solution: 2 mg/mL of USP Paroxetine Hydrochloride RS, 0.01 mg/mL of USP Paroxetine Related Compound B RS, 0.01 mg/mL of USP Paroxetine Related Compound F RS, and 0.004 mg/mL of USP Paroxetine Related Compound G RS in *Diluent*

Standard solution: 0.004 mg/mL of USP Paroxetine Hydrochloride RS, 0.01 mg/mL of USP Paroxetine Related Compound B RS, 0.01 mg/mL of USP Paroxetine Related Compound F RS, and 0.004 mg/mL of USP Paroxetine Related Compound G RS in *Diluent*

Sample solution: 0.5 mg/mL of Paroxetine Hydrochloride in *Diluent*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 3.9-mm × 15-cm; packing L1

Flow rate: 1.0 mL/min

Injection volume: 25 µL

System suitability

Sample: *Standard solution*

[NOTE—Identify the peaks using the relative retention times given in Table 5.]

Suitability requirements

Relative standard deviation: NMT 10.0% for each of paroxetine related compound B, paroxetine related compound F, paroxetine hydrochloride, and paroxetine related compound G

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of paroxetine related compound B, paroxetine related compound F, and paroxetine related compound G in the portion of Paroxetine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of the corresponding impurity from the *Sample solution*

r_S = peak response of the corresponding impurity from the *Standard solution*

C_S = concentration of the appropriate USP Reference Standard in the *Standard solution* (mg/mL)

C_U = concentration of Paroxetine Hydrochloride, on the anhydrous basis, in the *Sample solution* (mg/mL)

Calculate the percentage of any individual unspecified impurity in the portion of Paroxetine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of any individual unspecified impurity from the *Sample solution*

r_S = peak response of paroxetine from the *Standard solution*

C_S = concentration of USP Paroxetine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = concentration of Paroxetine Hydrochloride, on the anhydrous basis, in the *Sample solution* (mg/mL)

Acceptance criteria: See Table 5.

Table 5

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Paroxetine related compound B	0.91	0.5
Paroxetine related compound F	0.96	0.2
Paroxetine	1.0	—
Paroxetine related compound G	1.34	0.2
Any unspecified impurity	—	0.1
Total impurities	—	1.0

SPECIFIC TESTS

- **WATER DETERMINATION, Method I (921):** NMT 1.5% for the anhydrous form; 2.2%–2.8% for the hemihydrate form

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve the anhydrous form in tight containers. Preserve the hemihydrate form in well-closed containers. Store at controlled room temperature.

- **LABELING:** Label the article to indicate whether it is the anhydrous form or the hemihydrate form, and label it to indicate with which impurity tests the article complies.

• USP REFERENCE STANDARDS (11)

USP Paroxetine Hydrochloride RS

USP Paroxetine Related Compound B RS

trans-4-Phenyl-3-[(3,4-methylenedioxy)phenoxy]methylpiperidine hydrochloride.

USP Paroxetine System Suitability Mixture A RS
Mixture of approximately 1% paroxetine related compound A [piperidine, 3-[(1,3-benzodioxol-5-yloxy)methyl]-4-(4-methoxyphenyl)-, hydrochloride (3*S-trans*)]; and 1% of paroxetine related compound B [piperidine, 3-[(1,3-benzodioxol-5-yloxy)methyl]-4-phenyl-, hydrochloride (3*S-trans*)] in a matrix of paroxetine hydrochloride.

Paroxetine Tablets

DEFINITION

Paroxetine Tablets contain an amount of Paroxetine Hydrochloride equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of paroxetine ($C_{19}H_{20}FNO_3$).

IDENTIFICATION

A. INFRARED ABSORPTION (197K)

Sample: Transfer a quantity of finely powdered Tablets, equivalent to 90 mg of paroxetine, to a suitable flask. Add 100 mL of 0.1 N hydrochloric acid, and stir for 1 h. Transfer the mixture to a separatory funnel, and add 1.5 mL of ammonium hydroxide to make the solution alkaline. Add 100 mL of ethyl ether to the funnel, and shake for 2 min. Transfer the organic layer into the necessary number of centrifuge tubes, and centrifuge for 10 min. Recombine the clarified extracts, add 1 drop of water and 0.5 mL of hydrochloric acid, stir, and evaporate to dryness under a stream of nitrogen. Dry the residue in an oven at 90° for 1 h.

Acceptance criteria: Meet the requirements

B. The retention time of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

PROCEDURE

Buffer: Water, phosphoric acid, and triethylamine (100:0.6:0.3)

Mobile phase: Acetonitrile and Buffer (30:70)

Standard solution: 0.1 mg/mL of USP Paroxetine Hydrochloride RS in methanol

Sample stock solution: 0.5 mg/mL of paroxetine from NLT 20 Tablets in methanol prepared as follows. Transfer an amount of finely powdered Tablets equivalent to NLT 100 mg of paroxetine to a suitable volumetric flask. Dissolve in methanol. Dilute with methanol to volume. Centrifuge a portion of the solution for 6 min. Use the supernatant.

Sample solution: Nominally 0.1 mg/mL of paroxetine in methanol, from the *Sample stock solution*

Chromatographic system

(See Chromatography (621), *System Suitability*.)

Mode: LC

Detector: UV 295 nm

Column: 4.6-mm × 3.3-cm; 3-μm packing L7

Flow rate: 2 mL/min

Injection volume: 5 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 750 theoretical plates

Tailing factor: NMT 4

Relative standard deviation: NMT 2.0% for paroxetine

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of paroxetine ($C_{19}H_{20}FNO_3$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

C_U = nominal concentration of paroxetine in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of paroxetine, 329.37

M_{r2} = molecular weight of paroxetine hydrochloride, 365.83

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

DISSOLUTION (711)

Medium: Simulated gastric fluid without enzyme; 900 mL

Apparatus 2: 60 rpm

Time: 60 min

Buffer and Mobile phase: Proceed as directed in the Assay.

Standard stock solution: 0.63 mg/mL of USP Paroxetine Hydrochloride RS in *Medium* prepared as follows. Transfer a suitable quantity of USP Paroxetine Hydrochloride RS to a suitable volumetric flask. Add 5% of the flask volume of methanol, and dissolve. Dilute with *Medium* to volume.

Sample solution: Pass the solution under test through a suitable membrane filter of 0.45-μm pore size.

Standard solution: Quantitatively dilute the *Standard stock solution* with *Medium* to a concentration near that of the *Sample solution*.

Chromatographic system

(See Chromatography (621), *System Suitability*.)

Mode: LC

Detector: UV 295 nm

Column: 4.6-mm × 3.3-cm; 3-μm packing L7

Flow rate: 2 mL/min

Injection volume: 20 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 750 theoretical plates

Tailing factor: NMT 4

Relative standard deviation: NMT 2.0% for paroxetine

Analysis

Samples: *Sample solution* and *Standard solution*

Calculate the percentage of the labeled amount of paroxetine ($C_{19}H_{20}FNO_3$) dissolved based on the peak responses obtained from the *Sample solution* and the *Standard solution*.

Tolerances: NLT 80% (Q) of the labeled amount of paroxetine ($C_{19}H_{20}FNO_3$) is dissolved.

UNIFORMITY OF DOSAGE UNITS (905)

Buffer, Mobile phase, Standard solution, Chromatographic system, and System suitability: Proceed as directed in the Assay.

Sample solution: Nominally 0.1 mg/mL of paroxetine prepared as follows. Place 1 Tablet in a suitable volumetric flask, and add a volume of a hydrochloric acid solution (7 in 1000), equivalent to about 25% of the flask volume. Allow the Tablet to disintegrate. Dilute with methanol to volume. Centrifuge a portion of the solution.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of paroxetine ($C_{19}H_{20}FNO_3$) in the Tablet taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (M_{r1}/M_{r2}) \times V$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

M_{r1} = molecular weight of paroxetine, 329.37

M_{12} = molecular weight of paroxetine hydrochloride, 365.83

V = volume of the *Sample solution* (mL)

Acceptance criteria: Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS (11)**
USP Paroxetine Hydrochloride RS

Paroxetine Extended-Release Tablets

DEFINITION

Paroxetine Extended-Release Tablets contain paroxetine hydrochloride equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of paroxetine ($C_{19}H_{20}FNO_3$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• PROCEDURE

Buffer: 3.9 g/L of ammonium acetate in water. Adjust with glacial acetic acid to a pH of 4.5.

Mobile phase: Acetonitrile, *Buffer*, and triethylamine (40:60:1). Adjust with glacial acetic acid to a pH of 5.5.

Standard solution: 0.5 mg/mL of USP Paroxetine Hydrochloride RS in methanol

System suitability solution: 0.5 mg/mL of USP Paroxetine Related Compound B RS in *Standard solution*

Sample solution: Nominally 0.5 mg/mL of paroxetine from NLT 10 Tablets prepared as follows. Transfer the required number of Tablets to a suitable volumetric flask. Add 80% of the flask volume of methanol. Sonicate for 30 min followed by stirring for 30 min. Dilute with methanol to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 295 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L13

Flow rate: 1 mL/min

Injection volume: 10 μ L

System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for paroxetine related compound B and paroxetine are 0.9 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.5 between paroxetine related compound B and paroxetine, *System suitability solution*

Tailing factor: NMT 2.0 for paroxetine, *System suitability solution*

Relative standard deviation: NMT 2.0% for paroxetine, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of paroxetine ($C_{19}H_{20}FNO_3$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{11}/M_{12}) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Paroxetine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of paroxetine in the *Sample solution* (mg/mL)

M_{11} = molecular weight of paroxetine, 329.37

M_{12} = molecular weight of paroxetine hydrochloride, 365.83

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Test 1

Acid stage medium: 0.1 N hydrochloric acid; 750 mL
Buffer stage medium: 0.05 M tris buffer prepared as follows. Dissolve 6.06 g of tris(hydroxymethyl)amino-methane in 1 L of water. Add 1.8 mL of hydrochloric acid to the resulting solution. Adjust with hydrochloric acid to a pH of 7.5; 1000 mL deaerated.

Apparatus 1: 100 rpm

Times: 2 h in *Acid stage*; 2, 4, and 12 h in *Buffer stage*
Buffer and Mobile phase: Proceed as directed in the *Assay*.

Acid stage standard stock solution: 0.33 mg/mL of paroxetine prepared as follows. Transfer a suitable amount of USP Paroxetine Hydrochloride RS to a suitable volumetric flask. Dissolve in 5% of the flask volume of methanol. Dilute with *Acid stage medium* to volume.

Acid stage standard solution: Dilute the *Acid stage standard stock solution* with *Acid stage medium* to obtain a final concentration of ($L/7500$) mg/mL, where L is the label claim in mg.

Buffer stage standard stock solution: 0.25 mg/mL of paroxetine prepared as follows. Transfer a suitable amount of USP Paroxetine Hydrochloride RS to a suitable volumetric flask. Dissolve in 5% of the flask volume of methanol. Dilute with *Buffer stage medium* to volume.

Buffer stage standard solution: Dilute the *Buffer stage standard stock solution* with *Buffer stage medium* to obtain a final concentration of ($L/1000$) mg/mL, where L is the label claim in mg.

Acid stage sample solution: Run the *Acid stage* for 2 h. Withdraw 10 mL of the solution under test and centrifuge. Use the centrifugate for analysis.

Buffer stage sample solution: Remove the *Acid stage medium* from the vessel and replace it with the *Buffer stage medium*. At the times specified, remove 10 mL of the solution under test and centrifuge. Use the centrifugate for analysis.

Chromatographic system: Proceed as directed in the *Assay*. For *Injection volume*, use 100 μ L for the *Acid stage* analysis and 10 μ L for the *Buffer stage* analysis.

System suitability

Samples: *Acid stage standard solution* and *Buffer stage standard solution*

Suitability requirements

Tailing factor: NMT 2.0, *Acid stage standard solution* and *Buffer stage standard solution*

Relative standard deviation: NMT 3.0%, *Acid stage standard solution* and *Buffer stage standard solution*

Analysis

Samples: *Acid stage standard solution*, *Buffer stage standard solution*, *Acid stage sample solution*, and *Buffer stage sample solution*

Calculate the percentage of the labeled amount of paroxetine ($C_{19}H_{20}FNO_3$) dissolved in the *Acid stage*:

$$\text{Result} = (r_U/r_S) \times C_S \times (M_{11}/M_{12}) \times V \times (1/L) \times 100$$

r_U = peak response from the *Acid stage sample solution*

r_S = peak response from the *Acid stage standard solution*

- C_5 = concentration of USP Paroxetine Hydrochloride RS in the *Acid stage standard solution* (mg/mL)
 M_{r1} = molecular weight of paroxetine, 329.37
 M_{r2} = molecular weight of paroxetine hydrochloride, 365.83
 V = volume of the *Acid stage medium* (750 mL)
 L = label claim (mg/Tablet)

Calculate the concentration (C_i) of paroxetine ($C_{19}H_{20}FNO_3$) dissolved at each time point in the *Buffer stage*:

$$\text{Result} = (r_i/r_s) \times C_5 \times (M_{r1}/M_{r2})$$

- r_i = peak response from the *Buffer stage sample solution* at each time point i
 r_s = peak response from the *Buffer stage standard solution*
 C_5 = concentration of USP Paroxetine Hydrochloride RS in the *Buffer stage standard solution* (mg/mL)
 M_{r1} = molecular weight of paroxetine, 329.37
 M_{r2} = molecular weight of paroxetine hydrochloride, 365.83

Calculate the percentage of the labeled amount (Q_i) of paroxetine ($C_{19}H_{20}FNO_3$) dissolved at each time point (i) in the *Buffer stage medium*:

$$\text{Result}_1 = C_i \times V \times (1/L) \times 100$$

$$\text{Result}_2 = \{[C_2 \times (V - V_s)] + (C_1 \times V_s)\} \times (1/L) \times 100$$

$$\text{Result}_3 = \{[C_3 \times [V - (2 \times V_s)]] + [(C_2 + C_1) \times V_s]\} \times (1/L) \times 100$$

- C_i = concentration of paroxetine in the *Buffer stage medium* in the portion of sample withdrawn at time point i (mg/mL)
 V = volume of the *Buffer stage medium*, 1000 mL
 L = label claim (mg/Tablet)
 V_s = volume of the *Sample solution* withdrawn from the *Buffer stage medium* (mL)

Tolerances

Acid stage: NMT 10% of the labeled amount of paroxetine ($C_{19}H_{20}FNO_3$) is dissolved in 2 h.

Buffer stage: See Table 1.

Table 1

Time point (h)	Time (h)	Amount Dissolved (Tablets labeled to contain 12.5 mg of paroxetine)	Amount Dissolved (Tablets labeled to contain 25 mg of paroxetine)	Amount Dissolved (Tablets labeled to contain 37.5 mg of paroxetine)
1	2	15%–35%	10%–30%	20%–45%
2	4	40%–70%	40%–70%	60%–85%
3	12	NLT 80%	NLT 80%	NLT 80%

The percentages of the labeled amount of paroxetine ($C_{19}H_{20}FNO_3$) dissolved at the times specified conform to *Dissolution* (711), *Acceptance Table 2*.

Test 2

If the product complies with this procedure, the labeling indicates that it meets USP *Dissolution Test 2*.

Acid stage medium: 0.1 N hydrochloric acid; 750 mL

Buffer stage medium: 0.05 M tris buffer prepared as follows. Dissolve 6.06 g of tris(hydroxymethyl)amino-methane in 900 mL of water. Add 40 mL of 1.0 M hydrochloric acid to the resulting solution. Adjust with either 1.0 M hydrochloric acid or 1.0 M sodium hy-

droxide to a pH of 7.5. Dilute with water to 1 L; 1000 mL deaerated.

Apparatus 2: 150 rpm with suitable sinkers

Times: 2 h in *Acid stage*; 1, 2, 4, and 6 h in *Buffer stage*

Acid stage standard stock solution: 0.04 mg/mL of USP Paroxetine Hydrochloride RS prepared as follows. Transfer a suitable amount of USP Paroxetine Hydrochloride RS to a suitable volumetric flask. Dissolve in 2 mL of methanol. Dilute with *Acid stage medium* to volume.

Acid stage standard solution: Dilute the *Acid stage standard stock solution* with *Acid stage medium* to obtain a final concentration of $(L/7500)$ mg/mL of paroxetine, where L is the label claim in mg.

Buffer stage standard solution: $(L/1000)$ mg/mL of paroxetine, where L is the label claim in mg prepared as follows. Transfer a suitable amount of USP Paroxetine Hydrochloride RS to a suitable volumetric flask. Dissolve in 2 mL of methanol. Dilute with *Buffer stage medium* to volume.

Acid stage sample solution: Run the *Acid stage* for 2 h. Withdraw 10 mL of the solution under test, and filter. Use the filtrate for analysis.

Buffer stage sample solution: Remove the Tablet and sinker from the acid stage vessel and pat them dry. Introduce the Tablet and sinker into the dissolution vessel with 1000 mL of the *Buffer stage medium*. At the times specified, remove 10 mL of the solution under test and filter. Use the filtrate for analysis.

Acid stage analysis

Buffer: Add 2.9 mL of phosphoric acid to 800 mL of water. Adjust with 1 M sodium hydroxide to a pH of 6.0. Dilute with water to 1000 mL.

Mobile phase: Acetonitrile and *Buffer* (40:60)

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 205 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Flow rate: 2 mL/min

Injection volume: 50 μ L for 12.5-mg Tablet; 20 μ L for 25- and 37.5-mg Tablets

Run time: 2 times the retention time of paroxetine

System suitability

Sample: *Acid stage standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Acid stage standard solution* and *Acid stage sample solution*

Calculate the percentage of the labeled amount of paroxetine ($C_{19}H_{20}FNO_3$) dissolved in the *Acid stage*:

$$\text{Result} = (r_u/r_s) \times C_5 \times (M_{r1}/M_{r2}) \times V \times (1/L) \times 100$$

r_u = peak response from the *Acid stage sample solution*

r_s = peak response from the *Acid stage standard solution*

C_5 = concentration of USP Paroxetine Hydrochloride RS in the *Acid stage standard solution* (mg/mL)

M_{r1} = molecular weight of paroxetine, 329.37

M_{r2} = molecular weight of paroxetine hydrochloride, 365.83

V = volume of the *Acid stage medium* (750 mL)

L = label claim (mg/Tablet)

Buffer stage analysis

Instrumental conditions

Mode: UV

Analytical wavelength: 294 nm with 340 nm for background correction

Blank: Buffer stage medium

Analysis

Samples: Buffer stage standard solution and Buffer stage sample solution

Calculate the concentration (C_i) of paroxetine ($C_{19}H_{20}FNO_3$) dissolved at each time point (i) in the Buffer stage:

$$\text{Result} = (A_i/A_s) \times C_s \times (M_{r1}/M_{r2})$$

A_i = absorbance of the Buffer stage sample solution at time point i

A_s = absorbance of the Buffer stage standard solution

C_s = concentration of USP Paroxetine Hydrochloride RS in the Buffer stage standard solution (mg/mL)

M_{r1} = molecular weight of paroxetine, 329.37

M_{r2} = molecular weight of paroxetine hydrochloride, 365.83

Calculate the percentage of the labeled amount of paroxetine ($C_{19}H_{20}FNO_3$) dissolved at each time point (i) in the Buffer stage medium:

$$\text{Result}_1 = C_i \times V \times (1/L) \times 100$$

$$\text{Result}_2 = [(C_2 \times (V - V_3)) + (C_1 \times V_3)] \times (1/L) \times 100$$

$$\text{Result}_3 = [(C_3 \times [V - (2 \times V_3)]) + [(C_2 + C_1) \times V_3]] \times (1/L) \times 100$$

$$\text{Result}_4 = [(C_4 \times [V - (3 \times V_3)]) + [(C_3 + C_2 + C_1) \times V_3]] \times (1/L) \times 100$$

C_i = concentration of paroxetine in the Buffer stage medium in the portion of sample withdrawn at time point i (mg/mL)

V = volume of the Buffer stage medium, 1000 mL

L = label claim (mg/Tablet)

V_3 = volume of the Sample solution withdrawn from the Buffer stage medium (mL)

Tolerances

Acid stage: NMT 10% of the labeled amount of paroxetine ($C_{19}H_{20}FNO_3$) is dissolved in 2 h.

Buffer stage: See Table 2.

Table 2

Time Point (i)	Time (h)	Amount Dissolved
1	1	NMT 20%
2	2	20%–45%
3	4	60%–90%
4	6	NLT 85%

The percentages of the labeled amount of paroxetine ($C_{19}H_{20}FNO_3$) dissolved at the times specified conform to Dissolution (711), Acceptance Table 2.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

Solution A: Tetrahydrofuran, water, and trifluoroacetic acid (20:180:1)

Solution B: Acetonitrile, tetrahydrofuran, and trifluoroacetic acid (180:20:1)

Mobile phase: See Table 3.

Table 3

Time (min)	Solution A (%)	Solution B (%)
0	80	20
30	80	20
50	20	80
60	20	80
70	80	20
80	80	20

System suitability solution: 1 mg/mL of USP Paroxetine Hydrochloride RS, 0.1 mg/mL of USP Paroxetine System Suitability Mixture A RS, and 1 mg/mL of USP Paroxetine Related Compound F RS in methanol.

[NOTE—Sonication may be used to aid dissolution of the individual components.]

Standard solution: 0.01 mg/mL of USP Paroxetine Hydrochloride RS in methanol

Sample solution: Nominally 1 mg/mL of paroxetine from NLT 10 Tablets prepared as follows. Transfer a suitable number of Tablets to a suitable volumetric flask. Add 50% of the flask volume of methanol. Sonicate for 30 min followed by stirring for 30 min. Dilute with methanol to volume. Mix and centrifuge. Use the clear centrifugate.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 285 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L7

Column temperature: 40°

Flow rate: 1 mL/min

Injection volume: 20 μ L

System suitability

Samples: System suitability solution and Standard solution

[NOTE—See Table 4 for the relative retention times.]

Suitability requirements

Resolution: NLT 1.5 between paroxetine related compound A and paroxetine related compound B; NLT 1.5 between paroxetine related compound F and paroxetine, System suitability solution

Tailing factor: NMT 2.0 for paroxetine, Standard solution

Relative standard deviation: NMT 5.0% for paroxetine, Standard solution

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the Sample solution

r_S = peak response from the Standard solution

C_S = concentration of USP Paroxetine Hydrochloride RS in the Standard solution (mg/mL)

C_U = nominal concentration of paroxetine in the Sample solution (mg/mL)

M_{r1} = molecular weight of paroxetine 329.37

M_{r2} = molecular weight of paroxetine hydrochloride, 365.83

Acceptance criteria: See Table 4.

Table 4

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Paroxetine related compound A ^a	0.67	—
Paroxetine related compound B ^a	0.75	—
Paroxetine related compound F ^a	0.90	—
Paroxetine	1.0	—
Ethoxyparoxetine ^b	1.2	0.2
Any unspecified degradation product	—	0.2
Total impurities	—	0.5

^a Process impurities, included for identification only. Process impurities are controlled in the drug substance and are not to be reported or included in the total impurities of the drug product.

^b (3*SR*,4*RS*)-3-(1,3-Benzodioxol-5-yloxy)methyl)-4-(4-ethoxyphenyl)piperidine.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers at controlled room temperature.
- **LABELING** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.

Change to read:

• USP REFERENCE STANDARDS (11)

USP Paroxetine Hydrochloride RS

USP Paroxetine Related Compound B RS

trans-4-Phenyl-3-[(3,4-methylenedioxy)phenoxy]methylpiperidine hydrochloride; also known as Piperidine, 3-[(1,3-benzodioxol-5-yloxy)methyl]-4-phenyl-, hydrochloride (3*S-trans*).
 $C_{19}H_{21}NO_3 \cdot HCl$ 347.84 (ERR 1-Jun-2016)

USP Paroxetine Related Compound F RS

trans(-)-1-Methyl-3-[(1,3-benzodioxol-5-yloxy)methyl]-4-(4-fluorophenyl)piperidine.
 $C_{20}H_{22}FNO_3$ 343.39

USP Paroxetine System Suitability Mixture A RS

Mixture of approximately 1% paroxetine related compound A [piperidine, 3-[(1,3-benzodioxol-5-yloxy)methyl]-4-(4-methoxyphenyl)-, hydrochloride (3*S-trans*)], and 1% paroxetine related compound B [piperidine, 3-[(1,3-benzodioxol-5-yloxy)methyl]-4-phenyl-, hydrochloride (3*S-trans*)] in a matrix of paroxetine hydrochloride.

yields NLT 74.0% of galacturonic acid ($C_6H_{10}O_7$), calculated on the dried basis.

[NOTE—Commercial pectin for the production of jellied food products is standardized to the convenient “150 jelly grade” by addition of dextrose or other sugars, and sometimes contains sodium citrate or other buffer salts. This monograph refers to the pectin to which no such additions have been made.]

IDENTIFICATION

• PROCEDURE

Sample stock solution: Transfer a quantity of Pectin, equivalent to 0.05 g on the dried basis, to a suitable container, and moisten with 250 μ L of 2-propanol. Add 50 mL of water to the container, and mix the solution using a magnetic stirrer. Use 0.5 N sodium hydroxide to adjust the pH of the solution to 12, stop the stirrer, and allow the solution to stand undisturbed at room temperature for 15 min. Adjust with 0.5 N hydrochloric acid to a pH of 7.0, and dilute with water to 100 mL.

Tris buffer solution: Transfer 6.055 g of tris(hydroxymethyl)aminomethane and 0.147 g of calcium chloride ($CaCl_2 \cdot 2H_2O$) to a 1000-mL volumetric flask containing 950 mL of water. Adjust with 1 N hydrochloric acid to a pH of 7.0, and dilute with water to volume.

Enzyme solution: Mix pectate lyase¹ with *Tris buffer solution* to make a solution (1 in 100).

Sample blank: Mix 0.5 mL of *Tris buffer solution*, 1.0 mL of *Sample stock solution*, and 1.0 mL of water in a quartz cuvette.

Enzyme blank: Mix 0.5 mL of *Tris buffer solution*, 1.5 mL of water, and 0.5 mL of *Enzyme solution* in a quartz cuvette.

Sample solution: Mix 0.5 mL of *Tris buffer solution*, 1.0 mL of *Sample stock solution*, 0.5 mL of water, and 0.5 mL of *Enzyme solution* in a quartz cuvette.

Analysis

Samples: *Sample blank*, *Enzyme blank*, and *Sample solution*

Perform the test with the *Samples* using a suitable UV/visible spectrophotometer (see *Ultraviolet-Visible Spectroscopy* (857)) and using water as a blank. Measure the absorbance at 235 nm immediately after mixing the solutions well, and record the value at time 0 for the *Enzyme blank*, A_{0-EB} ; for the *Sample blank*, A_{0-TB} ; and for the *Sample solution*, A_{0-TS} . After incubation at room temperature for 10 min, determine the absorbance again at 235 nm for the *Enzyme blank*, A_{10-EB} ; for the *Sample blank*, A_{10-TB} ; and for the *Sample solution*, A_{10-TS} . Calculate the corrected absorbance A_0 at time 0 and the corrected absorbance A_{10} at 10 min:

$$A_0 = A_{0-TS} - (A_{0-EB} + A_{0-TB})$$

$$A_{10} = A_{10-TS} - (A_{10-EB} + A_{10-TB})$$

Calculate the quantity of unsaturated product produced:

$$\text{Result} = (A_{10} - A_0) / (\epsilon_{235} \times L)$$

ϵ_{235} = molar extinction coefficient of the reaction product ($4600 \text{ M}^{-1} \cdot \text{cm}^{-1}$)

L = path length of the reaction cuvette, 1 cm

Acceptance criteria: The amount of unsaturated product is NLT $0.5 \times 10^{-5} \text{ M}$.

ASSAY

• DEGREE OF ESTERIFICATION

Sample: 5.0 g

Analysis: Transfer the *Sample* to a suitable beaker, and stir for 10 min with a mixture of 5 mL of hydrochloric acid and 100 mL of 60% alcohol. Transfer to a sintered-

¹ A suitable pure enzyme is available from Megazyme International Ireland Ltd., Bray Business Park, Bray, Co. Wicklow, Ireland (www.megazyme.com).

Pectin

Pectin [9000-69-5].

DEFINITION

Pectin is a purified carbohydrate polymer consisting mainly of a linear backbone of partially methoxylated alpha (1-4) linked D-galacturonic acid. It is obtained from the dilute acid extract of the rind of citrus fruits or from apple pomace. No organic solvents other than methanol, ethanol, and isopropanol are used during its production. Pectin

glass filter (30- to 60-mL crucible or Büchner type, coarse), and wash with six 15-mL portions of the hydrochloric acid–60% alcohol mixture, followed by 60% alcohol until the filtrate is free from chlorides. Finally wash with 20 mL of alcohol, dry for 1 h at 105°, cool, and weigh. Transfer exactly one-tenth of the total net weight of the dried *Sample* (representing 500 mg of the original unwashed *Sample*) to a 250-mL conical flask, and moisten with 2 mL of alcohol. Add 100 mL of carbon dioxide-free water, insert the stopper, and swirl occasionally until the Pectin is completely dissolved. Add 5 drops of phenolphthalein TS, and titrate with 0.1 N sodium hydroxide VS. Perform a blank determination, and make any necessary correction. Record the results as the initial titer, V_i (mL). Add 20.0 mL of 0.5 N sodium hydroxide VS, insert the stopper, shake vigorously, and allow to stand for 15 min. Add 20.0 mL of 0.5 N hydrochloric acid VS, and shake until the pink color disappears. Add phenolphthalein TS, and titrate with 0.1 N sodium hydroxide VS to a faint pink color that persists after vigorous shaking. Perform a blank determination, and make any necessary correction. Record this value as the saponification titer, V_s (mL). Calculate the degree of esterification:

$$\text{Result} = [V_s / (V_i + V_s)] \times 100$$

V_s = saponification titer (mL)

V_i = initial titer (mL)

Acceptance criteria: The value for *Degree of Esterification* is within the range stated on the label.

- **GALACTURONIC ACID:** Each mL of 0.1 N sodium hydroxide used in the total titration (the initial titer added to the saponification titer) in the *Assay for Degree of Esterification* is equivalent to 19.41 mg of $C_6H_{10}O_7$. Calculate the percentage of galacturonic acid in the portion of Pectin taken:

$$\text{Result} = 19.41 \times [(V_i + V_s) / W] \times 100$$

V_i = initial titer (mL)

V_s = saponification titer (mL)

W = weight of the original unwashed and dried Pectin taken to prepare the solution for titration (mg)

Acceptance criteria: NLT 74.0%

- **METHOXY GROUPS:** Each mL of 0.1 N sodium hydroxide used in the saponification titer in the *Assay for Degree of Esterification* is equivalent to 3.10 mg of $-OCH_3$. Calculate the percentage of methoxy groups in the portion of Pectin taken:

$$\text{Result} = 3.10 \times (V_s / W) \times 100$$

V_s = saponification titer (mL)

W = weight of the original unwashed and dried Pectin taken to prepare the solution for titration (mg)

Acceptance criteria: The percentage of methoxy groups is within the range stated on the label.

IMPURITIES

- **ARSENIC, Method II (211):** NMT 3 ppm

- **LEAD**

Standard stock solution: 1000 µg/mL of lead. [NOTE—Use a commercially available certified solution.]

Standard solution: 2 µg/mL of lead, prepared immediately before use by pipetting 0.10 mL of *Standard stock solution* into a 50-mL volumetric flask containing 30 mL of water, 4 mL of 20% hydrochloric acid, and 4 mL of 0.1 M EDTA. Dilute with water to volume, and mix.

Reference solution: 0.4 µg/mL of lead, prepared by pipetting 5.0 mL of the *Standard solution* into a 25-mL volumetric flask containing 10 mL of water, 2 mL of 20% hydrochloric acid, and 2 mL of 0.1 M EDTA. Dilute with water to volume, and mix.

Sample solution: Transfer 2.0 g of Pectin to a clean, 100-mL glass beaker, add 25 mL of 70% nitric acid, cover with a watch glass, and heat at low to moderate heat on a hot plate in a fume hood for 2 h. Remove the watch glass, and continue to heat until the sample is dry with no visible fumes. Add 0.5 mL of 70% nitric acid, and heat to dryness. Cool to room temperature, and add 2 mL of 20% hydrochloric acid and 2 mL of 0.1 M EDTA. Quantitatively transfer the solution to a 25-mL volumetric flask, dilute with water to volume, and mix.

Blank solution: Add 30 mL of water, 4 mL of 20% hydrochloric acid, and 4 mL of 0.1 M EDTA into a 50-mL volumetric flask. Dilute with water to volume, and mix.

Analysis: Lead is determined using an inductively coupled plasma–atomic emission spectrometer (ICP–AES) (see *Plasma Spectrochemistry* (730)) by measuring the emission at 220.35 nm with the settings optimized as directed by the manufacturer. Instrument performance must be verified to conform to the manufacturer's specifications for resolution and sensitivity. Before analyzing samples, the instrument must pass a suitable performance check. Calibrate the instrument with the *Blank solution* and the *Standard solution*. Then analyze the *Reference solution* and the *Sample solution*.

Acceptance criteria: The concentration in the *Sample solution* is NMT that in the *Reference solution*, corresponding to NMT 5 ppm of lead.

- **SULFUR DIOXIDE, Method V (525)**

Sample: 100 g

Analysis: Suspend the *Sample* in 500 mL of methanol, then transfer this mixture to the flask (C). Prepare a mixture of 20 mL of hydrochloric acid and 10 mL of water, and transfer it to the separatory funnel (B). Add 10 mL of hydrogen peroxide solution to the vessel (G). Perform the refluxing for 2 h before removing the vessel (G).

Acceptance criteria: NMT 50 ppm

- **SUGARS AND ORGANIC ACIDS**

Sample: 1 g

Analysis: Place the *Sample* in a 500-mL flask, moisten with 3–5 mL of alcohol, rapidly pour in 100 mL of water, shake, and allow to stand until the solution is complete. To this solution add 100 mL of alcohol containing 0.3 mL of hydrochloric acid, mix, and filter rapidly. Measure 25 mL of the filtrate into a tared dish, evaporate the liquid on a steam bath, and dry the residue in a vacuum oven at 50° for 2 h.

Acceptance criteria: The weight of the residue does not exceed 20 mg, corresponding to NMT 16% of sugars and organic acids.

- **METHANOL (METHYL ALCOHOL), ETHANOL (ALCOHOL), AND ISOPROPANOL (2-PROPANOL)**

[NOTE—Residual alcohols are volatile. They should be stored in a cool and dry place. When preparing the *Standard stock solution*, *Standard solution*, and *Internal standard stock solution* for residual alcohols, mix thoroughly and keep the solutions at 20° when diluting with water to volume.]

Internal standard stock solution: 5000 µg/mL of USP 2-Butanol RS. [NOTE—This solution can be stored at 5°–8° for 3 months.]

Standard stock solution: Use USP Methyl Alcohol RS, USP 2-Propanol RS, and alcohol to prepare a solution having known concentrations of 5000 µg/mL each for methyl alcohol, 2-propanol, and alcohol.

Standard solution: To a 250-mL volumetric flask add 2.5 mL of the *Standard stock solution* and 2.5 mL of the *Internal standard stock solution*. Dilute with water to volume, and mix. This solution contains 50 µg/mL each of methyl alcohol, 2-propanol, and alcohol. [NOTE—This solution can be stored at 5°–8° for 3 months.] Transfer 1.0 g of this solution to a 10-mL headspace vial.

Sample solution: Transfer 1.0 g of Pectin and 5 g of sucrose to a stoppered 100-mL Erlenmeyer flask con-

taining 90 mL of water, add 1.0 mL of the *Internal standard stock solution*, and dilute with water to 100 mL. Mix the solution using a magnetic stirrer. Continue stirring until all of the Pectin has been completely dissolved; typically it takes about 1–2 h. This solution contains 50 µg/mL of USP 2-Butanol RS. Transfer 1.0 g of this solution to a 10-mL headspace vial.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: Headspace GC

Detector: Flame ionization

Column: 0.32-mm × 30-m capillary column; 1.8-µm layer of phase G43. [NOTE—An alternative column such as a 0.32-mm × 25-m capillary column bonded with a 5-µm layer of phase S3 can be used as long as the system suitability requirements are met.]

Temperatures

Detector: 280°

Column: 70°

Injection port: 200°

Carrier gas: Nitrogen

Flow rate: 1.5 mL/min

Make up gas: Nitrogen

Split flow rate: 30 mL/min

Injection volume: 1 mL (the gaseous headspace)

Injection type: Split ratio 20:1

Balanced pressure automatic headspace sampler

Equilibration time: 10 min

Equilibration temperature: 70°

Agitation speed: 500 rpm

Agitation on time: 5 s

Agitation off time: 90 s

Syringe temperature: 80°

Syringe size: 2.5 mL

Fill speed: 100 µL/s

Pull-up delay: 2.0 s

GC run time: 10.5 min

[NOTE—These GC conditions should be optimized according to the instruments used.]

System suitability

Sample: *Standard solution*

[NOTE—See *Table 1* for the relative retention times.]

Table 1

Component	Relative Retention Time
Methanol	0.5
Ethanol	0.6
2-Propanol	0.7
2-Butanol	1.0

Suitability requirements

Resolution: NLT 1.5, between each pair of analytes

Relative standard deviation: NMT 10%, determined from each analyte

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of methanol, ethanol, and 2-propanol in the portion of Pectin taken:

$$\text{Result} = (R_U/R_S) \times (C_S/W) \times F \times V \times 100$$

R_U = internal standard ratio (peak response of the respective alcohol/peak response of the internal standard) from the *Sample solution*

R_S = internal standard ratio (peak response of the respective alcohol/peak response of the internal standard) from the *Standard solution*

C_S = concentration of the respective residual alcohol (methanol, ethanol, or 2-propanol) in the *Standard solution* (µg/mL)

W = weight of Pectin taken to prepare the *Sample solution* (g)

F = conversion factor (10^{-6} g/µg)

V = volume of the *Sample solution*, 100 mL

Acceptance criteria: NMT 1% for total methanol, ethanol, and isopropanol

SPECIFIC TESTS

• **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count is NMT 10^3 cfu/g, and the total combined molds and yeasts count is NMT 10^2 cfu/g.

• **LOSS ON DRYING** (731)

Analysis: Dry a sample at 105° for 3 h.

Acceptance criteria: NMT 10.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers. Store in a cool and dry place.

• **LABELING:** Label it to indicate whether it is of apple or of citrus origin. Label it to indicate the range of the degree of esterification and the range of the percentage of methoxy groups. The labeling also indicates the presence of sulfur dioxide if the residual sulfur dioxide concentration is greater than 10 ppm.

• **USP REFERENCE STANDARDS** (11)

Anhydrous [150399-23-8].

$C_{20}H_{21}N_5O_6$ 427.42

Pemetrexed (free acid) [137281-23-3].

DEFINITION

Pemetrexed Disodium contains NLT 97.5% and NMT 102.0% of pemetrexed disodium ($C_{20}H_{19}N_5Na_2O_6$), calculated on the anhydrous and solvent-free basis.

[CAUTION]—Handle pemetrexed disodium with great care as it alters genetic material and may be irritating to the eyes and skin.]

IDENTIFICATION

• **A. INFRARED ABSORPTION** (197): [NOTE—Methods described in (197K) or (197A) may be used.]

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Enantiomeric Purity* test.

• **C. IDENTIFICATION TESTS—GENERAL** (191), *Sodium*

ASSAY

• **PROCEDURE**

Buffer: 0.17% (v/v) glacial acetic acid in water. Adjust with a 50% sodium hydroxide solution to a pH of 5.3 ± 0.1.

Mobile phase: Acetonitrile and *Buffer* (11:89)

Standard solution: 0.15 mg/mL of USP Pemetrexed Disodium RS in water

Sample solution: 0.15 mg/mL of Pemetrexed Disodium in water

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 285 nm

Column: 4.6-mm × 7.5-cm; 3.5-μm packing L7

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 20 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: 0.8–1.5

Relative standard deviation: NMT 0.73%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of pemetrexed disodium ($C_{20}H_{19}N_5Na_2O_6$) in the portion of Pemetrexed Disodium taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response from the *Sample solution*

r_s = peak response from the *Standard solution*

C_s = concentration of USP Pemetrexed Disodium RS in the *Standard solution* (mg/mL)

C_u = concentration of Pemetrexed Disodium in the *Sample solution* (mg/mL)

Acceptance criteria: 97.5%–102.0% on the anhydrous and solvent-free basis

IMPURITIES

• **ORGANIC IMPURITIES**

Buffer: 1.45 g/L of ammonium formate in water. Adjust with formic acid to a pH of 3.5 ± 0.1.

Solution A: Acetonitrile and *Buffer* (5:95)

Solution B: Acetonitrile and *Buffer* (30:70)

Mobile phase: See *Table 1*. [NOTE—After each injection, re-equilibrate the chromatographic system at the initial condition for a minimum of 13 min.]

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
45	0	100
47	100	0

System suitability stock solution: Prepare 3 mg/mL of USP Pemetrexed Disodium RS in 0.1 N sodium hydroxide. Heat this solution at 70° for 40 min.

[NOTE—The preparation degrades pemetrexed and generates the pemetrexed *R*-dimer and pemetrexed *S*-dimer as follows:

Pemetrexed *R*-dimer: (2*S*,2'*S*)-2,2'-[(*R*)-2,2'-Diamino-4,4',6-trioxo-1,4,4',6,7,7'-hexahydro-1'*H*,5*H*-5,6'-bipyrolo[2,3-*d*]pyrimidine-5,5'-diyl]bis(ethylenebenzene-4,1-diylcarbonylimino))diglutamic acid.

Pemetrexed *S*-dimer: (2*S*,2'*S*)-2,2'-[(*S*)-2,2'-Diamino-4,4',6-trioxo-1,4,4',6,7,7'-hexahydro-1'*H*,5*H*-5,6'-bipyrolo[2,3-*d*]pyrimidine-5,5'-diyl]bis(ethylenebenzene-4,1-diylcarbonylimino))diglutamic acid.]

System suitability solution: Transfer 1 mL of the *System suitability stock solution* to a 10-mL volumetric flask and dilute with water to volume.

Sensitivity solution: 0.1 μg/mL of USP Pemetrexed Disodium RS in water

Sample solution: 0.2 mg/mL of Pemetrexed Disodium in water. Do not sonicate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 250 nm

Column: 4.6-mm × 15-cm; 3.5-μm packing L7

Autosampler temperature: 2°–8°

Flow rate: 1 mL/min

Injection volume: 20 μL

System suitability

Samples: *System suitability solution* and *Sensitivity solution*

[NOTE—The relative retention times for the pemetrexed *R*-dimer and pemetrexed *S*-dimer peaks are 0.87 and 0.88, respectively.]

Suitability requirements

Peak-to-valley ratio: The ratio of the height of the pemetrexed *R*-dimer peak to the height of the valley between the pemetrexed *R*-dimer and pemetrexed *S*-dimer is NLT 1.5, *System suitability solution*.

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Pemetrexed Disodium taken:

$$\text{Result} = (r_u/r_t) \times 100$$

r_u = peak area of each impurity from the *Sample solution*

r_t = total peak areas from the *Sample solution*

Acceptance criteria: See *Table 2*. Disregard any peak less than 0.05%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
<i>N</i> -Methyl pemetrexed ^a	0.82	0.15
Pemetrexed glutamide ^b	0.90	0.15
Pemetrexed	1.0	—
Any individual unspecified impurity	—	0.10
Total impurities	—	0.60

^a [4-{2-(2-Amino-1-methyl-4-oxo-4,7-dihydro-1*H*-pyrrolo[2,3-*d*]pyrimidin-5-yl)ethyl}benzoyl]-L-glutamic acid.

^b [4-{2-(2-Amino-1-methyl-4-oxo-4,7-dihydro-1*H*-pyrrolo[2,3-*d*]pyrimidin-5-yl)ethyl}benzoyl]-L-glutamic acid.

• **ENANTIOMERIC PURITY**

Buffer: Dissolve 8 g of anhydrous beta cyclodextrin in 1 L of water. Add 15 mL of triethylamine to this solution and mix. Add about 6 mL of phosphoric acid and adjust with additional phosphoric acid to a pH of 6.0.

Mobile phase: Acetonitrile and *Buffer* (5:95)

Standard solution: 0.24 mg/mL of USP Pemetrexed Disodium RS in water

Sensitivity solution: 0.12 μg/mL of USP Pemetrexed Disodium RS in water from the *Standard solution*

Sample solution: 0.24 mg/mL of Pemetrexed Disodium in water

Chromatographic system(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Temperatures

Autosampler: 2°–8°

Column: 40°

Flow rate: 1 mL/min

Injection volume: 50 μL

System suitability**Samples:** *Standard solution* and *Sensitivity solution*

[NOTE—USP Pemetrexed Disodium RS contains a small amount of pemetrexed enantiomer disodium (disodium *N*-(*p*-[2-(2-amino-4,7-dihydro-4-oxo-1*H*-pyrrolo [2,3-*d*]pyrimidin-5-yl)ethyl]benzoyl)-*D*-glutamate). The relative retention times for pemetrexed enantiomer and pemetrexed are about 0.94 and 1.0, respectively.]

Suitability requirements

Peak-to-valley ratio: The ratio of the height of the pemetrexed enantiomer peak to the height of the valley between the pemetrexed enantiomer and pemetrexed is NLT 5.0, *Standard solution*

Signal-to-noise ratio: NLT 10 for the pemetrexed peak, *Sensitivity solution*

Analysis**Sample:** *Sample solution*

Calculate the percentage of pemetrexed enantiomer in the portion of Pemetrexed Disodium taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak area of pemetrexed enantiomer from the *Sample solution*

r_T = total peak areas of pemetrexed enantiomer and pemetrexed from the *Sample solution*

Acceptance criteria: NMT 0.3%

SPECIFIC TESTS• **WATER DETERMINATION** (921), *Method I, Method Ia or**Method Ic*: 19.5%–22.1%• **PH** (791)**Sample:** 56 mg/mL in water

Acceptance criteria: 7.5–8.4

• **BACTERIAL ENDOTOXINS TEST** (85): It contains less than 0.17 USP Endotoxin Units/mg of pemetrexed.**ADDITIONAL REQUIREMENTS**• **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at room temperature.• **USP REFERENCE STANDARDS** (11)

USP Endotoxin RS

USP Pemetrexed Disodium RS

▲USP40

Add the following:**Pemetrexed for Injection****DEFINITION**

Pemetrexed for Injection is a sterile, lyophilized mixture of pemetrexed disodium and suitable added substances. It contains NLT 90.0% and NMT 110.0% of the labeled amount of pemetrexed ($C_{20}H_{21}N_5O_6$).

[CAUTION—Handle pemetrexed disodium with great care as it alters genetic material and may be irritating to the eyes and skin.]

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **PROCEDURE**

Buffer: 0.17% (v/v) glacial acetic acid in water. Adjust with a 50% sodium hydroxide solution to a pH of 5.3.

Mobile phase: Acetonitrile and *Buffer* (11:89)

Standard solution: 0.14 mg/mL of USP Pemetrexed Disodium RS in water

Sample solution: Nominally equivalent to 0.1 mg/mL of pemetrexed in water, prepared from a composite of at least three vials of Pemetrexed for Injection

Chromatographic system(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 285 nm or diode array. [NOTE—Use a diode array detector to perform *Identification B*.]

Column: 4.6-mm × 7.5-cm; 3.5-μm packing L7

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 20 μL

System suitability**Sample:** *Standard solution***Suitability requirements****Tailing factor:** NMT 2.0**Relative standard deviation:** NMT 1.5%**Analysis****Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of pemetrexed ($C_{20}H_{21}N_5O_6$) in the portion of Pemetrexed for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Pemetrexed Disodium RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of pemetrexed in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of pemetrexed, 427.42

M_{r2} = molecular weight of pemetrexed disodium, 597.49

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS• **UNIFORMITY OF DOSAGE UNITS** (905), *Weight Variation*: Meets the requirements**IMPURITIES**• **ORGANIC IMPURITIES**

Buffer: 0.17% (v/v) glacial acetic acid in water. Adjust with a 50% sodium hydroxide solution to a pH of 5.5.

Solution A: Acetonitrile and *Buffer* (3:97)

Solution B: Acetonitrile and *Buffer* (12.5: 87.5)

Mobile phase: See *Table 1*. [NOTE—After each injection, re-equilibrate the chromatographic system at the initial condition for a minimum of 8 min.]

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
40	0	100
45	0	100
47	100	0

System suitability stock solution: 2.8 mg/mL of USP Pemetrexed Disodium RS prepared as follows. Transfer USP Pemetrexed Disodium RS to a suitable volumetric flask and add a 3% hydrogen peroxide solution equivalent to 10% of the final volume. Dilute with water to volume. Mix and heat this solution at 75° for 2–5 h and allow it to come to room temperature.

[NOTE—The solution preparation forms ketopemetrexed, pemetrexed R-dimer, and pemetrexed S-dimer.

Pemetrexed R-dimer: (2*S*,2'*S*)-2,2'-[[(*R*)-2,2'-Diamino-4,4',6-trioxo-1,4,4',6,7,7'-hexahydro-1'*H*,5*H*-5,6'-bipyrolo[2,3-*d*]pyrimidine-5,5'-diyl]bis(ethylenebenzene-4,1-diylcarbonylimino)]diglutaric acid.

Pemetrexed S-dimer: (2*S*,2'*S*)-2,2'-[[(*S*)-2,2'-Diamino-4,4',6-trioxo-1,4,4',6,7,7'-hexahydro-1'*H*,5*H*-5,6'-bipyrolo[2,3-*d*]pyrimidine-5,5'-diyl]bis(ethylenebenzene-4,1-diylcarbonylimino)]diglutaric acid.]

System suitability solution: Transfer 5 mL of the System suitability stock solution to a 50-mL volumetric flask and dilute with water to volume.

Sensitivity solution: 0.14 µg/mL of USP Pemetrexed Disodium RS in water

Sample solution: Nominally equivalent to 0.2 mg/mL of pemetrexed in water, prepared from 1 vial of Pemetrexed for Injection

Chromatographic system
(See Chromatography (621), System Suitability.)

USP Pemetrexed Disodium RS

▲USP40

Penbutolol Sulfate

(C₁₈H₂₉NO₂)₂ · H₂SO₄ 680.94

2-Propanol, 1-(2-cyclopentylphenoxy)-3-[(1,1-dimethylethyl)amino]-, (*S*)-, sulfate (2:1) (salt).

(*S*)-1-(*tert*-Butylamino)-3-(*o*-cyclopentylphenoxy)-2-propanol sulfate (2:1) (salt) [38363-32-5].

» Penbutolol Sulfate contains not less than 98.0 percent and not more than 102.0 percent of (C₁₈H₂₉NO₂)₂ · H₂SO₄, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Penbutolol Sulfate RS

Identification—

A: *Infrared Absorption* (197M).

B: A solution (10 mg per mL) responds to the tests for Sulfate (191).

Loss on drying (731)—Dry it at 105° for 3 hours: it loses not more than 1.0% of its weight.

Residue on ignition (281): not more than 0.2%.

Specific rotation (781S): between –22° and –26°, determined at 20°.

Test solution: 10 mg per mL, in methanol.

Chromatographic purity—

Organic phase—Prepare a mixture of methanol and acetonitrile (610:390). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Aqueous phase—Dissolve 11 g of sodium 1-heptanesulfonate in 1000 mL of water, add 5.0 mL of triethylamine, adjust with phosphoric acid to a pH of 2.70 ± 0.05 , and filter through a filter having a porosity of 0.5 μm or finer. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Solvent mixture—Prepare a mixture of *Organic phase* and *Aqueous phase* (600:400).

Test solution—Transfer about 50 mg of Penbutolol Sulfate to a 25-mL volumetric flask, dissolve in and dilute with *Solvent mixture* to volume, and mix.

Diluted test solution—Transfer 1.0 mL of the *Test solution* to a 100-mL volumetric flask, dilute with *Solvent mixture* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 271-nm detector, a preinjection guard column that contains packing L4, and a 4.6-mm \times 25-cm analytical column that contains packing L1 and is maintained at a constant temperature between ambient and 40°, and is programmed to provide variable mixtures of *Organic phase* and *Aqueous phase*. Before each injection, the system is equilibrated with a mobile phase consisting of a mixture of 60% *Organic phase* and 40% *Aqueous phase*. After each injection, this composition of the mobile phase is maintained for 15 minutes, then the proportion of *Organic phase* is increased linearly over the next 20 minutes so that the mobile phase consists of 80% *Organic phase* and 20% *Aqueous phase*. The proportion of *Organic phase* is then decreased to 60% over 1 minute. The flow rate is about 1 mL per minute. Chromatograph the *Diluted test solution*, and record the peak responses as directed for *Procedure*: the resolution, R , between the penbutolol peak and any impurity peak is not less than 1.5, and the tailing factor is not more than 2, when calculated by the formula:

$$W_{0.1} / 2f$$

in which $W_{0.1}$ is the width of the peak at 10% of peak height.

Procedure—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 20 μL) of the *Solvent mixture*, the *Test solution*, and the *Diluted test solution* into the chromatograph, and measure the peak responses for all the peaks. Calculate the percentage of each individual impurity in the Penbutolol Sulfate taken by the formula:

$$r_i / r_D$$

in which r_i is the peak response for an individual impurity in the chromatogram of the *Test solution*, and r_D is the penbutolol peak response obtained from the *Diluted test solution*: not more than 1.2% of any impurity is found.

Assay—

Organic phase—Prepare a mixture of methanol and acetonitrile (610:390). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Aqueous phase—Dissolve 11 g of sodium 1-heptanesulfonate in 1000 mL of water, add 5.0 mL of triethylamine, adjust with phosphoric acid to a pH of 2.70 ± 0.05 , and filter through a filter having a porosity of 0.5 μm or finer. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Mobile phase—Prepare a mixture of *Organic phase* and *Aqueous phase* (650:350). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Internal standard solution—Prepare a solution of 3,4-dimethylbenzophenone in *Mobile phase* containing about 0.01 mg per mL.

Standard preparation—Transfer about 24 mg of USP Penbutolol Sulfate RS, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Internal standard solution* to volume, and mix.

Assay preparation—Transfer about 24 mg of Penbutolol Sulfate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Internal standard solution* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 271-nm detector and a 4.6-mm \times 25-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.9 for penbutolol and 1.0 for 3,4-dimethylbenzophenone, and the resolution, R , between the penbutolol peak and the 3,4-dimethylbenzophenone peak is not less than 1.5, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas of the responses for the major peaks. Calculate the quantity, in mg, of $(\text{C}_{18}\text{H}_{29}\text{NO}_2)_2 \cdot \text{H}_2\text{SO}_4$ in the portion of Penbutolol Sulfate taken by the formula:

$$100C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Penbutolol Sulfate RS in the *Standard preparation*, and R_U and R_S are the ratios of the penbutolol peak response to the internal standard peak response obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Penbutolol Sulfate Tablets

» Penbutolol Sulfate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $(\text{C}_{18}\text{H}_{29}\text{NO}_2)_2 \cdot \text{H}_2\text{SO}_4$.

Packaging and storage—Preserve in well-closed, light-resistant containers.

USP Reference standards (11)—

USP Penbutolol Sulfate RS

Identification, Ultraviolet Absorption (197U)—

Solution: Sonicate a weighed portion of ground Tablets in sufficient methanol to obtain a solution containing about 0.4 mg of penbutolol sulfate per mL. Filter this solution, and dilute a portion of the filtrate with methanol to obtain a solution containing about 0.06 mg of penbutolol sulfate per mL.

Dissolution (711)—

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Mobile phase—Dissolve 2 g of ammonium acetate in 250 mL of water, add 750 mL of acetonitrile, mix, and adjust with glacial acetic acid to a pH of 6.0. Filter and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard solution—Dissolve an accurately weighed quantity of USP Penbutolol Sulfate RS quantitatively in water to obtain a stock solution having a known concentration of about 0.018 mg per mL. Mix 10.0 mL of this solution and

10.0 mL of acetonitrile, and filter through a filter having a 0.5- μ m or finer porosity.

Test solution—Filter about 30 mL of the solution under test. Mix 10.0 mL of the filtrate and 10.0 mL of acetonitrile, and filter through a filter having a 0.5- μ m or finer porosity.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 272-nm detector, a 4.6-mm \times 15-cm column that contains 5- μ m diameter packing L10. The flow rate is about 2.5 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.5%.

Procedure—Separately inject equal volumes (about 50 μ L) of the *Standard solution* and the *Test solution* into the chromatograph, and measure the areas of the responses for the penbutolol peaks. Calculate the quantity, in mg, of $(C_{18}H_{29}NO_2)_2 \cdot H_2SO_4$ dissolved by the formula:

$$1800C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Penbutolol Sulfate RS in the *Standard solution*, and r_U and r_S are the penbutolol peak responses obtained from the *Test solution* and the *Standard solution*, respectively.

Tolerances—Not less than 75% (Q) of the labeled amount of $(C_{18}H_{29}NO_2)_2 \cdot H_2SO_4$ is dissolved in 30 minutes.

Chromatographic purity—Examine the chromatogram of the *Assay preparation* obtained in the *Assay*. If an impurity peak is observed at a retention time of 0.8 relative to that of penbutolol, calculate the percentage of that impurity by the formula:

$$100r_i / r_s$$

in which r_i is the response of the impurity peak, and r_s is the sum of the responses of all of the peaks. If the percentage exceeds 1.2%, perform the following test.

Organic phase, Aqueous phase, Solvent mixture, and Chromatographic system—Proceed as directed in the test for *Chromatographic purity* under *Penbutolol Sulfate*.

Test solution—Transfer an accurately weighed portion of powdered Tablets, equivalent to about 100 mg of penbutolol sulfate, to a 50-mL volumetric flask, dilute with *Solvent mixture* to volume, mix, and filter.

Diluted test solution—Transfer 1.0 mL of the *Test solution* to a 100-mL volumetric flask, dilute with *Solvent mixture* to volume, and mix.

Procedure—Proceed as directed for *Procedure* in the test for *Chromatographic purity* under *Penbutolol Sulfate*. Calculate the percentage of each individual impurity in the portion of Tablets taken by the formula:

$$r_i / r_D$$

in which the terms are as defined therein: not more than 1.2% of any impurity is found.

Assay—

Organic phase, Aqueous phase, and Mobile phase—Proceed as directed in the *Assay* under *Penbutolol Sulfate*.

Standard preparation—Dissolve an accurately weighed quantity of USP Penbutolol Sulfate RS quantitatively in *Mobile phase* to obtain a solution having a known concentration of about 0.2 mg per mL.

Resolution solution—Prepare a solution of 3,4-dimethylbenzophenone in *Standard preparation* containing about 0.01 mg of 3,4-dimethylbenzophenone per mL.

Assay preparation—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 20 mg of penbutolol sulfate, to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Sonicate for about 10 minutes, and filter a portion through a filter having a 0.5- μ m or finer

porosity, discarding the first 5 mL of the filtrate. Use the clear filtrate as the *Assay preparation*.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 270-nm detector and a 4.6-mm \times 15-cm column that contains 5- μ m diameter packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.7 for penbutolol and 1.0 for 3,4-dimethylbenzophenone, and the tailing factor is not more than 1.4, when calculated by the formula:

$$W_{0.1} / 2f$$

in which $W_{0.1}$ is the width of the peak at 10% of peak height, the resolution, R , between the penbutolol peak and the 3,4-dimethylbenzophenone peak is not less than 5, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 20 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $(C_{18}H_{29}NO_2)_2 \cdot H_2SO_4$ in the portion of Tablets taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Penbutolol Sulfate RS in the *Standard preparation*, and r_U and r_S are the penbutolol peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Penicillamine

$C_5H_{11}NO_2S$ 149.21

D-Valine, 3-mercaptopropanoate.

D-3-Mercaptovaline [52-67-5].

» Penicillamine contains not less than 97.0 percent and not more than 102.0 percent of $C_5H_{11}NO_2S$, calculated on the dried basis.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Penicillamine RS

USP Penicillin G Potassium RS

USP Penicillamine Disulfide RS

$C_{10}H_{20}N_2O_4S_2$

Identification—

A: Infrared Absorption (197M) (50 mg in 300 mg).

B: Dissolve 10 mg in 5 mL of water, and add 1 drop of 5 N sodium hydroxide and 20 mg of ninhydrin: a blue or violet-blue color is produced immediately.

C: Dissolve 20 mg in 4 mL of water, add 2 mL of phosphotungstic acid solution (1 in 10), and heat nearly to boiling: a deep blue color is produced immediately.

Specific rotation (781S): between -60.5° and -64.5° .

Test solution: 50 mg per mL, in 1.0 N sodium hydroxide.

pH (791): between 4.5 and 5.5, in a solution (1 in 100).

Loss on drying (731)—Dry about 100 mg, accurately weighed, in a capillary-stoppered bottle in vacuum at a

pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 0.5% of its weight.

Residue on ignition (281): not more than 0.1%, the charred residue being moistened with 2 mL of nitric acid and 5 drops of sulfuric acid.

Delete the following:

• **Heavy metals, Method II** (231): not more than 0.002%.

• (Official 1-Jan-2018)

Change to read:

Limit of penicillin activity—

pH 2.5 Buffer—Dissolve 100 g of monobasic potassium phosphate in water, add 0.2 mL of hydrochloric acid, dilute with water to 1000 mL, and mix. Adjust, if necessary, with phosphoric acid or with 10 N potassium hydroxide to a pH of 2.5.

Standard preparation—Prepare as directed for Penicillin G in Table 1 under *Antibiotics—Microbial Assays* (81), except to prepare a final stock solution containing 100 Penicillin G Units per mL and six test dilutions ranging from 0.005 Penicillin G Unit per mL to 0.2 Penicillin G Unit per mL, and to use a median dose of the Standard of 0.050 Penicillin G Unit per mL.

Test preparation—Dissolve 1.0 g in water to make 18.0 mL, transfer 9.0 mL of this solution to a separator, add 20 mL of amyl acetate and 1 mL of pH 2.5 Buffer, and shake. Allow the layers to separate, and draw off the aqueous layer into a second separator, retaining the amyl acetate extract in the first separator. Check the pH of the aqueous layer, and if it is greater than 3.0 adjust it with hydrochloric acid to a pH of 2.5, and extract with 20 mL of amyl acetate. Discard the aqueous layer, and add the amyl acetate extract to the first separator. Wash the combined amyl acetate extracts with 10 mL of diluted pH 2.5 Buffer (1 in 10), and discard the aqueous layer. Extract the amyl acetate with 10.0 mL of Buffer B.1 (see *Antibiotics—Microbial Assays* (81), *Media and Solutions, Solutions, Buffers*). • (CN 1-May-2017) Use a portion of the buffer extract as *Test solution A*. To a 5-mL portion of the extract add 0.1 mL of penicillinase solution, and incubate at 36° to 37.5° for 60 minutes (*Test solution B*).

Preparation of inoculum—Prepare as directed under *Antibiotics—Microbial Assays* (81), using *Micrococcus luteus* (ATCC 9341) as the test organism, and an inoculum that gives clear sharp zones of inhibition 17 mm to 21 mm in diameter with the median dose level of the Standard.

Procedure—Proceed as directed for the *Cylinder-Plate Method* under *Antibiotics—Microbial Assays* (81), using 10 mL of Medium 1 for the base layer and 4 mL of inoculated Medium 4 for the seed layer, and incubating the plates at 29° to 31°, except on each test plate to fill 2 cylinders with *Test solution A*, 2 cylinders with *Test solution B*, and 2 cylinders with the median dose of the Standard. If *Test solution A* yields no zone of inhibition, the test is negative for penicillin. If *Test solution A* yields a zone of inhibition and *Test solution B* does not, penicillin is present. Determine its level from the standard curve: not more than 0.01 Penicillin G Unit is found in each mL of *Test solution A* (0.2 Penicillin G Unit per g).

Mercury—

NOTE—Mercuric dithizonate is light-sensitive. Perform this test in subdued light.

Dithizone stock solution—Dissolve 40 mg of dithizone in 1000 mL of chloroform.

Dithizone titrant—Dilute 30.0 mL of *Dithizone stock solution* with chloroform to 100.0 mL. This solution contains approximately 12 mg of dithizone per L.

Standard solution—Transfer 135.4 mg of mercuric chloride to a 100-mL volumetric flask, add 0.25 N sulfuric acid to

volume, and mix. This solution contains the equivalent of 100 µg of Hg in 100 mL.

Diluted standard solution—Pipet 2 mL of *Standard solution* into a 100-mL volumetric flask, add 0.25 N sulfuric acid to volume, and mix. Each mL of this solution contains the equivalent of 20 µg of Hg.

Standardization—Pipet 1 mL of *Diluted standard solution* into a 250-mL separator, and add 100 mL of 0.25 N sulfuric acid, 90 mL of water, and 10 mL of hydroxylamine hydrochloride solution (1 in 5). Then add 1 mL of edetate disodium solution (1 in 50), 1 mL of glacial acetic acid, and 5 mL of chloroform, shake for 1 minute, allow to separate, and discard the chloroform layer. To the solution add *Dithizone titrant*, in portions of 0.3 mL to 0.5 mL, from a 10-mL buret. After each addition, shake the mixture 20 times, and allow the chloroform layer to separate and discard it. Continue until an addition of *Dithizone titrant* remains green after the shaking. Calculate the quantity, in µg, of mercury equivalent to 1 mL of *Dithizone titrant* by dividing 20 by the number of mL of *Dithizone titrant* added.

Procedure—Transfer 500 mg of Penicillamine to a 650-mL Kjeldahl flask containing a few glass beads, incline the flask at an angle of about 45°, and add 2.5 mL of nitric acid through a small funnel placed in the mouth of the flask. Allow the mixture to stand at room temperature until nitrous oxide fumes are evolved and vigorous reaction subsides (5 to 30 minutes). Add 2.5 mL of sulfuric acid through the funnel, and heat, gently at first and then to the production of fumes of sulfur trioxide, then cool. Cautiously add 2.5 mL of nitric acid, again heat to the production of sulfur trioxide fumes, and cool. Repeat the treatment with nitric acid and heat, then cool, and cautiously add 50 mL of water, rinsing the funnel and collecting the rinsings in the flask. Remove the funnel, boil the solution down to approximately half its volume (about 25 mL), and cool to room temperature. Transfer to a 250-mL separator with the aid of water, and add water to make about 50 mL. Add 1 mL of edetate disodium solution (1 in 50) and 1 mL of glacial acetic acid, and extract with small portions of chloroform until the last chloroform extract remains colorless. Discard the chloroform extract, and add 50 mL of 0.25 N sulfuric acid, 90 mL of water, and 10 mL of hydroxylamine hydrochloride solution (1 in 5). Add *Dithizone titrant*, in portions of 0.3 mL to 0.5 mL, from a 10-mL buret. After each addition, shake the mixture 20 times, and allow the chloroform layer to separate and discard it. Continue until an addition of *Dithizone titrant* remains green after the shaking. Calculate the amount of mercury present: the limit is 10 µg (0.002%).

Limit of penicillamine disulfide—

Diluent, Mobile phase, and Resolution solution—Prepare as directed in the Assay.

Standard preparation—Dissolve an accurately weighed quantity of USP Penicillamine Disulfide RS in *Diluent* to obtain a solution having a known concentration of about 0.025 mg per mL.

Test preparation—Use the Assay preparation.

Chromatographic system—Proceed as directed in the Assay. Chromatograph the *Standard preparation*, and record the penicillamine disulfide peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the responses for the penicillamine disulfide peaks. Calculate the percentage of penicillamine disulfide ($C_{10}H_{20}N_2O_4S_2$) in the Penicillamine taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which C_S is the concentration, in mg per mL, of USP Penicillamine Disulfide RS in the *Standard preparation*, C_U is

the concentration, in mg per mL, of Penicillamine in the *Test preparation*, and r_U and r_S are the penicillamine disulfide peak responses obtained from the *Test preparation* and the *Standard preparation*, respectively: not more than 1.0% of penicillamine disulfide is found.

Assay—

Diluent—Dissolve 1.0 g of edetate disodium in water to make 1000 mL of solution.

Mobile phase—Dissolve 6.9 g of monobasic sodium phosphate and 0.20 g of sodium 1-hexanesulfonate in water to make 1000 mL of solution. Adjust with phosphoric acid to a pH of 3.0 ± 0.1 , and filter through a suitable filter of 1 μ m or finer porosity. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Resolution solution—Prepare a solution in *Diluent* containing about 1 mg of USP Penicillamine RS and 0.1 mg of USP Penicillamine Disulfide RS per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Penicillamine RS in *Diluent* to obtain a solution having a concentration of about 1.25 mg per mL.

Assay preparation—Transfer about 125 mg of Penicillamine, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 210-nm detector and a 3.9-mm \times 30-cm column containing packing L1. The flow rate is about 1.6 mL per minute. Chromatograph the *Resolution solution*, and record the responses as directed for *Procedure*: the relative retention times are about 0.7 for penicillamine and 1.0 for penicillamine disulfide, and the resolution, R , between the penicillamine peak and the penicillamine disulfide peak is not less than 3.0. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 20 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of penicillamine ($C_5H_{11}NO_2S$) in the portion of Penicillamine taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Penicillamine RS in the *Standard preparation*, and r_U and r_S are the penicillamine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Penicillamine Capsules

» Penicillamine Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_5H_{11}NO_2S$.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Penicillamine RS
USP Penicillamine Disulfide RS
 $C_{10}H_{20}N_2O_4S_2$

Identification—The contents of the Capsules respond to *Identification* test A under *Penicillamine Tablets* and to *Identification* test C under *Penicillamine*.

Dissolution (711)—

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 1: 100 rpm.

Time: 30 minutes.

PROCEDURE FOR A POOLED SAMPLE—

Dilute hydrochloric acid—Dilute 37 mL of hydrochloric acid with water to 1 L.

Ammonium sulfamate reagent—Dissolve 250 mg of ammonium sulfamate in 100 mL of *Dilute hydrochloric acid*.

***N*-(1-Naphthyl)ethylenediamine dihydrochloride reagent**—Dissolve 100 mg of *N*-(1-naphthyl)ethylenediamine dihydrochloride in 100 mL of *Dilute hydrochloric acid*.

Sulfanilamide-mercuric chloride reagent—Dissolve 100 mg of sulfanilamide and 100 mg of mercuric chloride in 100 mL of *Dilute hydrochloric acid*.

Sodium nitrite reagent—Dissolve 200 mg of sodium nitrite in 100 mL of dilute sulfuric acid (1 in 50). Prepare fresh.

Standard solution—Dissolve an accurately weighed quantity of USP Penicillamine RS in 0.1 N hydrochloric acid to obtain a solution having a known concentration of about 250 μ g per mL.

Procedure—Pipet an aliquot of the filtered test solution, estimated to contain about 278 μ g of penicillamine, into a 100-mL volumetric flask. Into a similar flask pipet an equivalent volume of 0.1 N hydrochloric acid to provide a reagent blank, and into a third 100-mL volumetric flask pipet 1 mL of *Standard solution*. Treat each flask as follows. Add by pipet 3 mL of *Sodium nitrite reagent*, and mix by swirling occasionally. After 5 minutes, add 10 mL of *Ammonium sulfamate reagent*, swirl, and allow to stand for an additional 5 minutes. Add 5 mL of *Sulfanilamide-mercuric chloride reagent*, swirl, and immediately add 10 mL of *N*-(1-Naphthyl)ethylenediamine dihydrochloride reagent. Dilute with water to volume, and mix. Determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 540 nm, with a suitable spectrophotometer, against the reagent blank. Calculate the percentage dissolution of the Capsule taken by the formula:

$$90(C/WV)(A_U / A_S)$$

in which C is the concentration, in μ g per mL, of USP Penicillamine RS in the *Standard solution*; W is the labeled quantity, in mg, of penicillamine in the Capsule; V is the volume, in mL, of the aliquot of test solution used; and A_U and A_S are the absorbances of the solutions from the test solution and the *Standard solution*, respectively.

Tolerances—Not less than 80% (Q) of the labeled amount of $C_5H_{11}NO_2S$ is dissolved in 30 minutes.

PROCEDURE FOR A UNIT SAMPLE —

Buffer solution—Prepare a 50-mM solution of monobasic potassium phosphate buffer, pH 3.0.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and methanol (97:3). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard solution—Prepare a solution of USP Penicillamine RS in 0.1 N hydrochloric acid having a known concentration corresponding to the content of 1 Capsule dissolved in 900 mL of *Medium*.

Resolution solution—Prepare a solution of USP Penicillamine Disulfide RS in 0.1 N hydrochloric acid having a known concentration of about 0.002 mg per mL.

Test solution—Proceed as directed for *Procedure* for *Capsules*, *Uncoated Tablets*, and *Plain Coated Tablets* under *Dissolution* (711). After 30 minutes, withdraw about 10 mL of solution from each vessel, and immediately pass each aliquot through a 0.45- μ m polyvinylidene difluoride filter paper. Discard the first 2 mL of filtered solution, and chromatograph the remaining filtrate.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 15-cm column that contains 5-μm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution, R , between penicillamine and penicillamine disulfide is not less than 2.0.

Procedure—Separately inject equal volumes (about 30 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount, in percentage, of $C_5H_{11}NO_2S$ released by the formula:

$$\frac{r_U \times C_S \times 900 \times 100}{r_S \times LC}$$

in which r_U and r_S are the peak areas obtained from the *Test solution* and the *Standard solution*, respectively; C_S is the concentration, in mg per mL, of the *Standard solution*; 900 is the volume, in mL, of *Medium*; 100 is the conversion factor to percentage; and LC is the label claim, in mg, for each Capsule.

Tolerances—Not less than 80% (Q) of the labeled amount of $C_5H_{11}NO_2S$ is dissolved in 30 minutes.

Uniformity of dosage units (905): meet the requirements.

Loss on drying (731)—Dry about 100 mg of Capsule contents, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 1.0% of its weight.

Limit of penicillamine disulfide—

Diluent, Mobile phase, and Resolution solution—Proceed as directed in the *Assay* under *Penicillamine*.

Standard preparation—Dissolve an accurately weighed quantity of USP Penicillamine Disulfide RS in *Diluent* to obtain a solution having a known concentration of about 0.025 mg per mL.

Test preparation—Use the *Assay preparation*.

Chromatographic system—Proceed as directed in the *Assay* under *Penicillamine*. Chromatograph the *Standard preparation*, and record the penicillamine disulfide peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the responses for the penicillamine disulfide peaks. Calculate the percentage of penicillamine disulfide ($C_{10}H_{20}N_2O_4S_2$) in the Capsules taken by the formula:

$$100(C/L)(V/N)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Penicillamine Disulfide RS in the *Standard preparation*; L is the quantity, in mg, of penicillamine in each Capsule based on the labeled amount; V is the volume, in mL, of the volumetric flask used to prepare the *Assay preparation* in the *Assay*; N is the number of Capsules used to prepare the *Assay preparation* in the *Assay*; and r_U and r_S are the penicillamine disulfide peak responses obtained from the *Test preparation* and the *Standard preparation*, respectively: not more than 2.0% of penicillamine disulfide is found.

Assay—

Diluent, Mobile phase, Resolution solution, Standard preparation, and Chromatographic system—Proceed as directed in the *Assay* under *Penicillamine*.

Assay preparation—Carefully open and transfer the contents of not fewer than 10 Capsules, accurately counted, to a suitable volumetric flask of such volume that when treated as described below, a solution is obtained that contains about 1.25 mg of penicillamine per mL. Add the empty Capsule shells to the flask, and add sufficient *Diluent* to the flask to fill it to about three-fourths of its capacity. Shake for 1 minute, and allow the mixture to stand for 90 minutes. Dilute with *Diluent* to volume, and mix. Filter a portion of this solution through a suitable filter of 1 μm or finer porosity, and use the clear filtrate as the *Assay preparation*.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Penicillamine*. Calculate the quantity, in mg, of penicillamine ($C_5H_{11}NO_2S$) in each Capsule taken by the formula:

$$C(V/N)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Penicillamine RS in the *Standard preparation*; V is the volume, in mL, of the volumetric flask used to prepare the *Assay preparation*; N is the number of Capsules used to prepare the *Assay preparation*; and r_U and r_S are the penicillamine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Penicillamine Tablets

» Penicillamine Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_5H_{11}NO_2S$.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Penicillamine RS

USP Penicillamine Disulfide RS

Identification—

A: Transfer a portion of finely powdered Tablets, equivalent to about 100 mg of penicillamine, to a 10-mL volumetric flask, dilute with methanol to volume, add 2 drops of 3 N hydrochloric acid, mix, and filter. Use the filtrate as the test solution. Prepare a *Standard solution* by dissolving 100 mg of USP Penicillamine RS in 10 mL of methanol, adding 2 drops of 3 N hydrochloric acid, and mixing. Separately apply 10-μL portions of the test solution and the *Standard solution* to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture, heated at 105° for 30 minutes, and allowed to cool before use. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of butyl alcohol, glacial acetic acid, and water (8:2:2) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate, mark the solvent front, allow the solvent to evaporate, and place the plate in an atmosphere of iodine vapors. After a few minutes, spray the plate with a 1 in 300 solution of ninhydrin in dehydrated alcohol, heat it at 105° for about 10 minutes, allow it to cool, and examine it: the R_f values, colors, and intensities of the principal spots obtained from the test solution correspond to those obtained from the *Standard solution*.

B: A portion of powdered Tablets responds to *Identification test C* under *Penicillamine*.

Dissolution (711)—

Medium: 0.5% edetate disodium and 0.05% sodium lauryl sulfate solution; 900 mL.

Apparatus 1: 100 rpm.

Time: 60 minutes.

Mobile phase—Prepare a filtered and degassed solution of 0.01 M dibasic sodium phosphate and 0.01 M monobasic potassium phosphate (60:40). If necessary, adjust the solution by the addition of 0.01 M dibasic sodium phosphate or 0.01 M monobasic potassium phosphate to a pH of 7.0 ± 0.1 .

Standard solution—Prepare a solution of USP Penicillamine RS in 0.5% edetate disodium and 0.05% sodium lauryl sulfate solution having an accurately known concentration of about 0.28 mg per mL.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm \times 30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph replicate injections of the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 2.0%, and the resolution factor between the solvent peak and penicillamine is not less than 1.5.

Procedure—Separately inject equal volumes (about 80 μ L) of the *Standard solution* and a filtered portion of the solution under test into the chromatograph, record the chromatograms, measure the responses for the major peaks, and calculate the amount of $C_5H_{11}NO_2S$ dissolved per Tablet.

Tolerances—Not less than 80% (Q) of the labeled amount of $C_5H_{11}NO_2S$ is dissolved in 60 minutes.

Uniformity of dosage units (905): meet the requirements.

Loss on drying (731)—Dry about 100 mg of finely ground Tablets, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 3.0% of its weight.

Penicillamine disulfide—

Diluent—Prepare as directed in the *Assay*.

Mobile phase, Resolution solution, and Chromatographic system—Proceed as directed in the *Assay* under *Penicillamine*.

Standard preparation—Dissolve an accurately weighed quantity of USP Penicillamine Disulfide RS in *Diluent* to obtain a solution having a known concentration of about 0.025 mg per mL.

Test preparation—Use the *Assay preparation*.

Chromatographic system—Proceed as directed in the *Assay* under *Penicillamine*. Chromatograph the *Standard preparation*, and record the penicillamine disulfide peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 20 μ L) of the *Standard preparation* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the responses for the penicillamine disulfide peaks. Calculate the percentage of penicillamine disulfide ($C_{10}H_{20}N_2O_4S_2$) in the portion of Tablets taken by the formula:

$$20,000(C/L)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Penicillamine Disulfide RS in the *Standard preparation*, L is the quantity, in mg, of penicillamine in each Tablet based on the labeled amount, and r_U and r_S are the penicillamine disulfide peak responses obtained from the *Test preparation* and the *Standard preparation*, respectively: not more than 3.0% of penicillamine disulfide is found.

Assay—

Diluent—Dissolve 5.0 g of edetate disodium in water to make 1000 mL of solution.

Mobile phase, Resolution solution, and Chromatographic system—Proceed as directed in the *Assay* under *Penicillamine*.

Standard preparation—Dissolve an accurately weighed quantity of USP Penicillamine RS in *Diluent* to obtain a solution having a known concentration of about 1.25 mg per mL.

Assay preparation—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 250 mg of penicillamine, to a 200-mL volumetric flask, add about 150 mL of *Diluent*, shake for 5 minutes, and allow the mixture to stand for 90 minutes. Dilute with *Diluent* to volume, and mix. Filter a portion of this solution through a suitable filter of 1 μ m or finer porosity, and use the clear filtrate as the *Assay preparation*.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Penicillamine*. Calculate the quantity, in mg, of penicillamine ($C_5H_{11}NO_2S$) in the portion of Tablets taken by the formula:

$$200C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Penicillamine RS in the *Standard preparation*, and r_U and r_S are the penicillamine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Penicillin G, Neomycin, Polymyxin B, Hydrocortisone Acetate, and Hydrocortisone Sodium Succinate Topical Suspension

» Penicillin G, Neomycin, Polymyxin B, Hydrocortisone Acetate, and Hydrocortisone Sodium Succinate Topical Suspension is a suspension of Penicillin G Procaine, Neomycin Sulfate, Polymyxin B Sulfate, Hydrocortisone Acetate, and Hydrocortisone Sodium Succinate in a suitable vehicle. It contains not less than 90.0 percent and not more than 140.0 percent of the labeled amounts of neomycin, penicillin G, and polymyxin B, and not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of hydrocortisone acetate ($C_{23}H_{32}O_6$) and hydrocortisone sodium succinate ($C_{25}H_{33}NaO_8$).

Packaging and storage—Preserve in well-closed containers.

Labeling—Label Topical Suspension to indicate that it is for veterinary use only.

USP Reference standards (11)—

USP Hydrocortisone Acetate RS
USP Hydrocortisone Hemisuccinate RS
USP Neomycin Sulfate RS
USP Penicillin G Potassium RS
USP Polymyxin B Sulfate RS

Identification—

A: Shake a quantity of Topical Suspension, equivalent to about 50,000 USP Polymyxin B Units, with 20 mL of chloroform, add 5 mL of 0.1 N hydrochloric acid, shake vigorously, centrifuge, and use the clear supernatant liquid as the *Sample solution*. Apply separately 10 μ L of the *Sample solution* and 10 μ L of a *Standard solution* of USP Polymyxin B Sulfate RS in 0.1 N hydrochloric acid containing 10,000 USP Polymyxin B Units per mL to a suitable thin-layer chromatographic plate.

graphic plate coated with a 0.25-mm layer of dimethylsilanized chromatographic silica gel mixture (see *Chromatography* (621)). Place the plate in a suitable chromatographic chamber, and develop the chromatogram in a solvent system consisting of a mixture of isopropyl alcohol, water, and ammonium hydroxide (24:17:3) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, and dry at 105° for 5 minutes. Spray the plate with a 1 in 200 solution of ninhydrin in butyl alcohol, and heat the plate at 105° for 15 minutes: the R_f value of the principal spot in the chromatogram obtained from the *Sample solution* corresponds to that of the principal spot in the chromatogram obtained from the *Standard solution*.

B: It responds to the Identification test under *Penicillin G Procaine Intramammary Infusion*.

C: The chromatogram of the *Assay preparation* obtained as directed in the *Assay for hydrocortisone acetate and hydrocortisone sodium succinate* exhibits major peaks for hydrocortisone acetate and hydrocortisone sodium succinate, the retention times of which, relative to that of the internal standard, correspond to those for hydrocortisone acetate and hydrocortisone hemisuccinate exhibited in the chromatogram of the *Standard preparation* obtained as directed in the *Assay for hydrocortisone acetate and hydrocortisone sodium succinate*.

Water Determination, Method I (921): not more than 1.0%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

Assay for penicillin G—Proceed with the Topical Suspension as directed in the *Assay for penicillin G under Penicillin G Procaine, Neomycin and Polymyxin B Sulfates, and Hydrocortisone Acetate Topical Suspension*.

Assay for neomycin—Proceed with the Topical Suspension as directed in the *Assay for neomycin under Penicillin G Procaine, Neomycin and Polymyxin B Sulfates, and Hydrocortisone Acetate Topical Suspension*.

Assay for polymyxin B—Proceed with the Topical Suspension as directed in the *Assay for polymyxin B under Penicillin G Procaine, Neomycin and Polymyxin B Sulfates, and Hydrocortisone Acetate Topical Suspension*.

Assay for hydrocortisone acetate and hydrocortisone sodium succinate—

Mobile phase—Prepare a filtered and degassed mixture of butyl chloride, water-saturated butyl chloride, tetrahydrofuran, methanol, and glacial acetic acid (544:544:58:29:25). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Extraction solution—Prepare a mixture of chloroform and glacial acetic acid (1000:30).

Internal standard solution—Prepare a solution in tetrahydrofuran containing about 1.4 mg of methylprednisolone per mL.

Standard preparation—Transfer about 7.5 mg of USP Hydrocortisone Acetate RS, accurately weighed, and 7.5J mg of USP Hydrocortisone Hemisuccinate RS, accurately weighed, to a conical flask, J being the ratio of the labeled amount, in mg, of hydrocortisone sodium succinate to the labeled amount, in mg, of hydrocortisone acetate in the Topical Suspension. Add 5.0 mL of *Internal standard solution* and about 95 mL of *Extraction solution*, and mix.

Resolution solution—Dissolve about 3.7 mg of penicillin G procaine in 10 mL of *Standard preparation*.

Assay preparation—Transfer an accurately measured portion of well-mixed Topical Suspension, equivalent to about 7.5 mg of hydrocortisone acetate, to a conical flask. Add 5.0 mL of *Internal standard solution* and about 95 mL of *Extraction solution*, and shake by mechanical means for about 15 minutes. Centrifuge a portion of this mixture, and use the clear supernatant as the *Assay preparation*.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm de-

tector, a guard column containing packing L3, and a 3.9-mm × 30-cm analytical column that contains packing L3. The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution*, and measure the peak responses as directed for *Procedure*: the relative retention times for penicillin G procaine, hydrocortisone acetate, hydrocortisone hemisuccinate, and methylprednisone are about 0.3, 0.4, 0.7, and 1.0, respectively, and the resolution, R_s , between penicillin G procaine and hydrocortisone acetate is not less than 1.5. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation of the ratios of the hydrocortisone acetate peak to the internal standard peak and the hydrocortisone sodium succinate peak to the internal standard peak is not more than 2%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of hydrocortisone acetate in the portion of Topical Suspension taken by the formula:

$$W(R_U / R_S)$$

in which W is the quantity, in mg, of USP Hydrocortisone Acetate RS taken to prepare the *Standard preparation*, and R_U and R_S are the ratios of the hydrocortisone acetate peak response to the internal standard peak response obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the quantity, in mg, of hydrocortisone sodium succinate in the portion of Topical Suspension taken by the formula:

$$(484.52 / 462.54)(W)(R_U / R_S)$$

in which 484.52 and 462.54 are the molecular weights of hydrocortisone sodium succinate and anhydrous hydrocortisone hemisuccinate, respectively, W is the quantity, in mg, of USP Hydrocortisone Hemisuccinate RS taken to prepare the *Standard preparation*, and R_U and R_S are the ratios of the hydrocortisone hemisuccinate peak response to the internal standard peak response obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Penicillin G Benzathine

($C_{16}H_{18}N_2O_4S$)₂ · $C_{16}H_{20}N_2$ · 4H₂O 981.18
4-Thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, 3,3-dimethyl-7-oxo-6-[(phenylacetyl)amino]-, 2[5-(2α,5α,6β)-, compd. with *N,N'*-bis(phenylmethyl)-1,2-ethanediamine (2:1), tetrahydrate.
(2*S*,5*R*,6*R*)-3,3-Dimethyl-7-oxo-6-(2-phenylacetamido)-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid compound with *N,N'*-dibenzylethylenediamine (2:1), tetrahydrate [41372-02-5].
Anhydrous 909.15 [1538-09-6].

» Penicillin G Benzathine has a potency of not less than 1090 Penicillin G Units and not more than 1272 Penicillin G Units per mg.

Packaging and storage—Preserve in tight containers.

Labeling—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must

be subjected to further processing during the preparation of injectable dosage forms.

USP Reference standards (11)—

USP Endotoxin RS
USP Penicillin G Benzathine RS
USP Penicillin G Potassium RS

Identification, *Ultraviolet Absorption* (197U)—

Solution: 500 µg per mL.

Medium: methanol.

Absorptivity at 263 nm is between 85.0% and 110.0% of that of USP Penicillin G Benzathine RS.

Crystallinity (695): meets the requirements.

Bacterial Endotoxins Test (85)—Where the label states that Penicillin G Benzathine is sterile or that it must be subjected to further processing during the preparation of injectable dosage forms it contains not more than 0.01 USP Endotoxin Unit per 100 Penicillin G Units.

Sterility Tests (71)—Where the label states that Penicillin G Benzathine is sterile it meets the requirements when tested as directed in the section *Direct Inoculation of the Culture Medium under Test for Sterility of the Product to be Examined*, except to use Fluid Thioglycollate Medium and Soybean-Casein Digest Medium containing polysorbate 80 solution (1 in 200) and an amount of sterile penicillinase sufficient to inactivate the penicillin G in each tube, and to shake the vessels once daily.

pH (791): between 4.0 and 6.5, in a solution prepared by dissolving 50 mg in 50 mL of dehydrated alcohol, adding 50 mL of water, and mixing.

Water Determination, *Method I* (921): between 5.0% and 8.0%.

Benzathine content—To about 1 g of Penicillin G Benzathine, accurately weighed, add 30 mL of a saturated solution of sodium chloride and 10 mL of 5 N sodium hydroxide, and extract with four 50-mL portions of ether. Wash the combined ether extracts with three 10-mL portions of water. Extract the combined water washings with 25 mL of ether, and add the ether extract to the water-washed combined ether extracts. Evaporate this combined ether solution to a volume of about 5 mL, add 2 mL of dehydrated alcohol, and evaporate to dryness. Dissolve the residue in 50 mL of glacial acetic acid, add 1 mL of *p*-naphtholbenzene TS, and titrate with 0.1 N perchloric acid VS to a green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 12.02 mg of benzathine ($C_{16}H_{20}N_2$): between 24.0% and 27.0% of benzathine in Penicillin G Benzathine, calculated on the anhydrous basis, is found.

Assay—

0.05 M phosphate buffer, pH 6.0—Dissolve 6.8 g of monobasic potassium phosphate in 900 mL of water, adjust with 1 N sodium hydroxide to a pH of 6.0, dilute with water to 1000 mL, and mix.

Mobile phase—Prepare a mixture of *0.05 M phosphate buffer, pH 6.0* and acetonitrile (4:1), pass through a membrane filter having a 5-µm or finer porosity, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Transfer about 40 mg of USP Penicillin G Potassium RS, accurately weighed, to a 50-mL volumetric flask, add 10 mL of acetonitrile and 5 mL of methanol, and swirl to dissolve. Without delay, dilute with *0.05 M phosphate buffer, pH 6.0* to volume, and mix.

System suitability preparation—Prepare a solution of penicillin V potassium in *Mobile phase* containing about 1 mg per mL. Mix equal volumes of this solution and the *Standard preparation*.

Assay preparation—Transfer about 53 mg of Penicillin G Benzathine, accurately weighed, to a 50-mL volumetric flask, add 10 mL of acetonitrile and 5 mL of methanol, and swirl

to dissolve. Without delay, dilute with *0.05 M phosphate buffer, pH 6.0* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 225-nm detector and a 4-mm × 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation* and the *System suitability preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.7 for penicillin G and 1.0 for penicillin V; the resolution, *R*, between penicillin G and penicillin V is not less than 2.0; the column efficiency determined from the analyte peak is not less than 600 theoretical plates; and the relative standard deviation for replicate injections of the *Standard preparation* is not more than 1.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the potency, in Penicillin G Units per mg, of the Penicillin G Benzathine taken by the formula:

$$50(CP/W)(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of USP Penicillin G Potassium RS in the *Standard preparation*; *P* is the stated potency, in Penicillin G Units per mg, of USP Penicillin G Potassium RS; *W* is the quantity, in mg, of Penicillin G Benzathine taken to prepare the *Assay preparation*; and *r_U* and *r_S* are the penicillin G peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Penicillin G Benzathine Injectable Suspension

» Penicillin G Benzathine Injectable Suspension is a sterile suspension of Penicillin G Benzathine in Water for Injection with one or more suitable buffers, dispersants, preservatives, and suspending agents. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of penicillin.

Packaging and storage—Preserve in single-dose or multiple-dose containers, preferably of Type I or Type II glass, in a refrigerator.

USP Reference standards (11)—

USP Endotoxin RS
USP Penicillin G Benzathine RS
USP Penicillin G Potassium RS

Identification—It responds to the *Identification* test under *Penicillin G Benzathine Oral Suspension*.

Bacterial Endotoxins Test (85)—It contains not more than 0.01 Endotoxin Unit per 100 Penicillin G Units.

Sterility Tests (71)—It meets the requirements when tested as directed for *Direct Inoculation of the Culture Medium under Test for Sterility of the Product to be Examined*, except to use Fluid Thioglycollate Medium and Soybean-Casein Digest Medium containing polysorbate 80 solution (1 in 200) and an amount of sterile penicillinase sufficient to inactivate the penicillin G in each vessel, and to shake the vessels once daily.

pH (791): between 5.0 and 7.5.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Change to read:**Assay—**

Standard preparation—Using USP Penicillin G Potassium RS, prepare as directed for *Standard preparation* under *Iodometric Assay—Antibiotics* (425).

Assay preparation—Using a suitable hypodermic needle and syringe, withdraw an accurately measured volume of Injectable Suspension, equivalent to about 300,000 Penicillin G Units, and dilute quantitatively with 1.0 N sodium hydroxide to obtain an *Assay preparation* containing about 2000 Penicillin G Units per mL. Pipet 2.0 mL of this solution into a glass-stoppered, 125-mL conical flask.

Blank preparation—Using a suitable hypodermic needle and syringe, withdraw an accurately measured volume of Injectable Suspension, equivalent to about 300,000 Penicillin G Units, and quantitatively dilute with *Buffer B.1* (CN 1-May-2017) to obtain a suspension containing about 2000 Penicillin G Units per mL. Pipet 2 mL of this solution into a glass-stoppered, 125-mL conical flask.

Procedure—Proceed as directed for *Procedure* under *Iodometric Assay—Antibiotics* (425), except in performing the *In-activation and Titration* to omit the addition of 1.0 N sodium hydroxide to the *Assay preparation*, and in performing the *Blank Determination* to use the *Blank preparation* in place of the *Assay preparation*. Calculate the quantity, in Penicillin G Units, in each mL of the Injectable Suspension taken by the formula:

$$(L / 2D)(F(B - I))$$

in which *L* is the labeled quantity, in Penicillin G Units per mL, in the Injectable Suspension taken, and *D* is the concentration, in Penicillin G Units per mL, in the *Assay preparation* on the basis of the labeled quantity in the Injectable Suspension and the extent of dilution, and the other terms are as defined therein.

Penicillin G Benzathine Oral Suspension

» Penicillin G Benzathine Oral Suspension contains not less than 90.0 percent and not more than 120.0 percent of the labeled amount of penicillin G. It contains one or more suitable buffers, colors, dispersants, flavors, and preservatives.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Penicillin G Benzathine RS
USP Penicillin G Potassium RS

Identification—Mix a portion of it with methanol to obtain a solution containing about 3000 Penicillin G Units per mL. Apply 20 μ L of this test solution and 20 μ L of a Standard solution of USP Penicillin G Benzathine RS in methanol containing 2.5 mg per mL to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel, and allow the spots to dry. Using an unlined developing chamber, develop the chromatogram in a solvent system consisting of a mixture of methanol, acetonitrile, and ammonium hydroxide (70:30:3) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, and allow to air-dry. Spray the plate uniformly with a spray reagent prepared as follows. Dissolve 20 g of tartaric acid and 1.7 g of bismuth subnitrate in 80 mL of water. Add 2.5 mL of this solution, 2.5 mL of potassium iodide solution (4 in 10), and 10 g of tartaric

acid to 50 mL of water, and mix. Examine the chromatograms: the principal spot obtained from the test solution corresponds in *R_f* value to that obtained from the Standard solution.

Uniformity of dosage units (905)—

FOR SUSPENSION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

Deliverable volume (698): meets the requirements.

pH (791): between 6.0 and 7.0.

Change to read:**Assay—**

Standard preparation—Using Penicillin G Potassium RS, prepare as directed for *Standard preparation* under *Iodometric Assay—Antibiotics* (425).

Assay preparation—Dilute an accurately measured volume of Oral Suspension, freshly mixed and free from air bubbles, quantitatively with 1.0 N sodium hydroxide to obtain a solution having a concentration of about 2000 Penicillin G Units per mL. Pipet 2 mL of this solution into a glass-stoppered, 125-mL conical flask.

Blank preparation—Dilute an accurately measured volume of Oral Suspension, freshly mixed and free from air bubbles, quantitatively with *Buffer B.1* (CN 1-May-2017) to obtain a suspension containing about 2000 Penicillin G Units per mL. Pipet 2 mL of this solution into a glass-stoppered, 125-mL conical flask.

Procedure—Proceed as directed for *Procedure* under *Iodometric Assay—Antibiotics* (425), except in performing the *In-activation and titration* to omit the addition of 1.0 N sodium hydroxide to the *Assay preparation*, and in performing the *Blank determination* to use the *Blank preparation* in place of the *Assay preparation*. Calculate the quantity, in Penicillin G Units, in each mL of the Oral Suspension taken by the formula:

$$(L / 2D)(F(B - I))$$

in which *L* is the labeled quantity, in Penicillin G Units per mL, in the Oral Suspension taken, and *D* is the concentration, in Penicillin G Units per mL, of the *Assay preparation* on the basis of the labeled quantity in the Oral Suspension and the extent of dilution.

Penicillin G Benzathine Tablets

» Penicillin G Benzathine Tablets contain not less than 90.0 percent and not more than 120.0 percent of the labeled amount of penicillin G.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Penicillin G Benzathine RS
USP Penicillin G Potassium RS

Identification—Shake a suitable quantity of finely powdered Tablets with methanol to obtain a solution containing about 3000 Penicillin G Units per mL, and filter: the filtrate so obtained responds to the *Identification* test under *Penicillin G Benzathine Oral Suspension*.

Disintegration (701): 60 minutes, simulated gastric fluid TS being used in place of water as the test medium.

Uniformity of dosage units (905): meet the requirements.

Water Determination, Method I (921): not more than 8.0%.

Change to read:**Assay—**

Standard preparation—Using Penicillin G Potassium RS, prepare as directed for *Standard preparation* under *Iodometric Assay—Antibiotics* (425).

Assay preparation—Weigh and finely powder not less than 20 Tablets. Transfer a portion of the powder, accurately weighed, equivalent to about 200,000 Penicillin G Units, to a 100-mL volumetric flask, add 10 mL of 1.0 N sodium hydroxide, and mix. Allow to stand for 15 minutes, add 10 mL of 1.2 N hydrochloric acid, dilute with water to volume, and mix. Pipet 2 mL of this solution into a glass-stoppered, 125-mL conical flask.

Blank preparation—Transfer an accurately weighed portion of the powdered Tablets remaining from the preparation of the *Assay preparation*, equivalent to about 200,000 Penicillin G Units, to a 100-mL volumetric flask, dilute with **Buffer B.1** (CN 1-May-2017) to volume, and mix. Pipet 2 mL of this solution into a glass-stoppered, 125-mL conical flask.

Procedure—Proceed as directed for *Procedure* under *Iodometric Assay—Antibiotics* (425), except in performing the *Inactivation and titration* to omit the addition of 1.0 N sodium hydroxide and 1.2 N hydrochloric acid, and in the *Blank determination* to use the *Blank preparation* in place of the *Assay preparation*. Calculate the quantity, in Penicillin G Units, in the portion of Tablets taken by the formula:

$$(T/2D)(F(B - I))$$

in which *T* is the labeled quantity, in Penicillin G Units, in each Tablet, and *D* is the concentration, in Penicillin G Units per mL, of the *Assay preparation* on the basis of the labeled quantity in each Tablet and the extent of dilution.

Penicillin G Benzathine and Penicillin G Procaine Injectable Suspension

» Penicillin G Benzathine and Penicillin G Procaine Injectable Suspension is a sterile suspension of Penicillin G Benzathine and Penicillin G Procaine or, when labeled for veterinary use only, of Penicillin G Benzathine and penicillin G procaine, in Water for Injection. It may contain one or more suitable buffers, preservatives, and suspending agents. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amounts of penicillin G benzathine and penicillin G procaine.

Packaging and storage—Preserve in single-dose or multiple-dose containers, preferably of Type I or Type III glass.

Labeling—Where it is intended for veterinary use only, it is so labeled.

USP Reference standards (11)—

USP Endotoxin RS
USP Penicillin G Benzathine RS
USP Penicillin G Potassium RS
USP Procaine Hydrochloride RS

Identification—

A: It responds to the *Identification* test under *Penicillin G Benzathine Oral Suspension*: the spot obtained from the test solution, corresponding in *R_f* value to that obtained from the Standard solution, is completely resolved from a second spot, produced by penicillin G procaine.

B: It responds to the *Identification* test under *Penicillin G Procaine*.

Crystallinity (695) (where it is prepared from penicillin G procaine and is labeled as intended for veterinary use only)—Dilute a portion of the Injectable Suspension, equivalent to about 300,000 Penicillin G Units, with water to obtain a volume of 10 mL, and centrifuge. Remove and discard the supernatant fluid. Resuspend the residue in 10 mL of water, and centrifuge. Remove and discard the supernatant fluid. Dry the residue in a vacuum desiccator. The dried residue meets the requirements.

pH (791): between 5.0 and 7.5.

Limit of soluble penicillin G and procaine (where it is prepared from penicillin G procaine and is labeled for veterinary use only)—

Mobile phase—Dissolve 4 g of sodium 1-hexanesulfonate and 5.44 g of monobasic potassium phosphate in 760 mL of water, adjust with phosphoric acid to a pH of 2.5, dilute with acetonitrile to 1000 mL, and mix. Pass through a filter having a 0.5-μm or finer porosity, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

pH 6.0 Phosphate buffer—Dissolve 16 g of monobasic potassium phosphate and 4 g of dibasic sodium phosphate in water, dilute with water to 200 mL, adjust with phosphoric acid or 1 N sodium hydroxide to a pH of 6.0.

Diluent—Transfer 60 mL of butyl alcohol, 100 mL of acetonitrile, and 10 mL of pH 6.0 Phosphate buffer to a 500-mL volumetric flask, dilute with water to volume, and mix.

Standard solution—Transfer about 24 mg of USP Penicillin G Potassium RS, accurately weighed, and about 8 mg of USP Procaine Hydrochloride RS, accurately weighed, to a 100-mL volumetric flask, add 12 mL of butyl alcohol and 20 mL of acetonitrile, and shake to dissolve. Add 2 mL of pH 6.0 Phosphate buffer and mix and bring to volume with water.

Test solution—Centrifuge about 20 mL of the Suspension. Remove the supernatant fluid, and pass it through a filter having a 5-μm or finer porosity. Transfer 5.0 mL of the clear filtrate to a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 204-nm detector and a 4-mm × 15-cm column that contains 5-μm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 0.3%.

Procedure—Separately inject equal volumes (about 5 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of penicillin G (C₁₆H₁₈N₂O₄S) in the *Test solution* by the formula:

$$(334.40 / 372.48)(C)(r_U / r_S)$$

in which 334.40 and 372.48 are the molecular weights of penicillin G and penicillin G potassium respectively; *C* is the concentration, in mg per mL, of USP Penicillin G Potassium RS in the *Standard solution*; and *r_U* and *r_S* are the responses of the penicillin G peaks in the chromatograms of the *Test solution* and the *Standard solution*, respectively: not more than 1% is found. Calculate the percentage of procaine (C₁₃H₂₀N₂O₂) in the *Test solution* by the formula:

$$(236.32 / 272.78)(C)(r_U / r_S)$$

in which 236.32 and 272.78 are the molecular weights of procaine and procaine hydrochloride, respectively; *C* is the concentration, in mg per mL, of USP Procaine Hydrochloride RS in the *Standard solution*; and *r_U* and *r_S* are the responses of the procaine peaks in the chromatograms of the *Test so-*

lution and the *Standard solution*, respectively: not more than 1% is found.

Other requirements—It meets the requirements for *Bacterial endotoxins and Sterility* under *Penicillin G Procaine Injectable Suspension*. It meets also the requirements under *Injections and Implanted Drug Products* (1).

Assay for penicillin G procaine—

Standard preparations—Transfer about 14k mg of USP Procaine Hydrochloride RS, accurately weighed, to a 500-mL volumetric flask, and dissolve in 2 mL of 0.5 N sodium hydroxide, *k* being the ratio of the labeled number of Penicillin G Procaine Units to the labeled number of Penicillin G Benzathine Units in the Injectable Suspension. After 15 minutes, add 1 mL of 1.2 N hydrochloric acid, dilute with water to volume, and mix. This stock solution contains about 28k µg of USP Procaine Hydrochloride RS per mL. Transfer 1.0, 2.0, 3.0, 4.0, and 5.0 mL, respectively, of this stock solution to each of five 25-mL volumetric flasks. Transfer 4.0, 3.0, 2.0, and 1.0 mL of water to the first four flasks, respectively.

Assay preparation—Where the Injectable Suspension is represented as being in a single-dose container, withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe. Where the label states the quantities of penicillin G benzathine and penicillin G procaine in a given volume of Injectable Suspension, remove an accurately measured volume of the Injectable Suspension. For each 300,000 Penicillin G Benzathine Units in the specimen of Injectable Suspension taken, add 20 mL of 0.5 N sodium hydroxide, and mix. After 15 minutes, add 0.5 mL of 1.2 N hydrochloric acid for each mL of 0.5 N sodium hydroxide used, and dilute quantitatively with water to obtain a solution containing 36 Penicillin G Procaine Units per mL. Transfer 5.0 mL of this solution to a 50-mL volumetric flask.

Procedure—To each of the flasks containing the *Standard preparations* and the *Assay preparation*, and to a seventh 50-mL volumetric flask containing 5.0 mL of water to provide the blank, add 0.5 mL of 4 N hydrochloric acid, 1.0 mL of sodium nitrite solution (1 in 1000), 1.0 mL of ammonium sulfamate solution (1 in 200), and 1.0 mL of N-(1-naphthyl)ethylenediamine dihydrochloride solution (1 in 1000), mixing and allowing 2 minutes to elapse after each addition. Dilute the contents of each flask with water to volume, and mix. Concomitantly determine the absorbances of the solutions from the *Standard preparations* and the *Assay preparation* at the wavelength of maximum absorbance at about 550 nm, with a suitable spectrophotometer, using the blank to set the instrument at zero. Plot the absorbance values of solutions from the *Standard preparations* versus concentration, in mg per mL, of procaine hydrochloride in the solutions from the *Standard preparations*, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration (*C*), in mg per mL, of procaine hydrochloride in the solution from the *Assay preparation*. Calculate the quantity, in Penicillin G Procaine Units in each container or in each mL of the Injectable Suspension taken by the formula:

$$(588.73 / 272.78)(1009.1)(CL / D)$$

in which 588.73 and 272.78 are the molecular weights of penicillin G procaine monohydrate and procaine hydrochloride, respectively; 1009.1 is the theoretical potency, in Penicillin G Units, in each mg of penicillin G procaine; *L* is the labeled amount, in Penicillin G Procaine Units in each container or in each mL of Injectable Suspension taken; and *D* is the concentration, in Penicillin G Procaine Units per mL, of the solution from the *Assay preparation*, on the basis of the labeled amount in each container or in each mL of Injectable Suspension taken and the extent of dilution.

Change to read:

Assay for penicillin G benzathine—

Standard preparation—Using USP Penicillin G Potassium RS, prepare as directed for *Standard preparation* under *Iodometric Assay—Antibiotics* (425).

Assay preparation—Where the Injectable Suspension is represented as being in a single-dose container, withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe. Where the label states the quantities of penicillin G benzathine and penicillin G procaine in a given volume of Injectable Suspension, remove an accurately measured volume of Injectable Suspension, freshly mixed but free from air bubbles. Dilute the specimen of Injectable Suspension taken quantitatively with 1 N sodium hydroxide to obtain a solution containing about 2000 Penicillin G Units per mL. Pipet 2 mL of this solution into each of two glass-stoppered, 125-mL conical flasks.

Blank preparation—Prepare as directed for *Assay preparation*, except to use *Buffer B.1* (CN 1-May-2017) instead of 1.0 N sodium hydroxide.

Procedure—Proceed as directed for *Procedure* under *Iodometric Assay—Antibiotics* (425), except in performing the *Inactivation and Titration* to omit the addition of 1.0 N sodium hydroxide to the *Assay preparation*, and in performing the *Blank Determination* to use the *Blank preparation* in place of the *Assay preparation*. Calculate the total quantity, *T*, in Penicillin G Units, in each mL of the Injectable Suspension taken by the formula:

$$(L / 2D)(F)(B - I)$$

in which *L* is the labeled quantity, in Penicillin G Units in each container, or per mL, in the Injectable Suspension taken; and *D* is the concentration, in Penicillin G Units per mL, in the *Assay preparation* on the basis of the labeled quantity in the Injectable Suspension and the extent of dilution. Calculate the quantity, in Penicillin G Benzathine Units, in each container, or in each mL, of the Injectable Suspension taken by the formula:

$$T - P$$

in which *P* is the quantity, in Penicillin G Procaine Units, in each container, or in each mL, of Injectable Suspension taken, as determined in the *Assay for penicillin G procaine*.

Penicillin G Potassium

$C_{16}H_{17}KN_2O_4S$ 372.48
4-Thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, 3,3-dimethyl-7-oxo-6-[(phenylacetyl)amino]-, monopotassium salt, [2S-(2 α ,5 α ,6 β)]-;
Monopotassium (2S,5R,6R)-3,3-dimethyl-7-oxo-6-(2-phenylacetamido)-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate [113-98-4].

DEFINITION

Penicillin G Potassium has a potency of NLT 1440 and NMT 1680 Penicillin G Units/mg.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**
 - **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
 - **C.**
 - Diluent:** Glycerin and water (25:14)
 - Solution A:** 106 mg/mL of sodium carbonate in water
 - Solution B:** 120 mg/mL of sodium sulfide in *Diluent*, prepared as follows. Dissolve sodium sulfide in *Diluent*, using about 45% of the final volume and heat. Allow to cool, and dilute with *Diluent* to the final volume.
 - Solution C:** 150 mg/mL of tartaric acid in water
 - Sample solution:** 0.1 g of Penicillin G Potassium in 2 mL of water
- Analysis**
- Part 1:** Add 1 mL of *Solution A* to the *Sample solution* and heat.
- Part 2:** To the hot solution from *Part 1* add 0.05 mL of *Solution B*.
- Part 3:** Cool the mixture from *Part 2* in iced water and add 2 mL of *Solution C*. Allow to stand.
- Acceptance criteria:** Meets the requirements for *Parts 1, 2, and 3*
- Part 1:** No precipitate is formed.
- Part 2:** No precipitate is formed.
- Part 3:** A white precipitate is formed.

ASSAY• **PROCEDURE**

Solution A: 0.01 M monobasic potassium phosphate

Mobile phase: Methanol and *Solution A* (40:60)

System suitability solution: 0.1 mg/mL each of USP Penicillin G Potassium RS and 2-phenylacetamide in water

Standard solution: 0.1 mg/mL of USP Penicillin G Potassium RS in water. This solution contains about 160 Penicillin G Units/mL. Shake as needed to dissolve.

Sample solution: 0.1 mg/mL of Penicillin G Potassium in water. Shake as needed to dissolve.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 10-cm; 5-μm packing L1

Flow rate: 1 mL/min

Injection volume: 10 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for 2-phenylacetamide and penicillin G are about 0.8 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between 2-phenylacetamide and penicillin G, *System suitability solution*

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the potency of penicillin G potassium, in Penicillin G Units/mg, in the portion of Penicillin G Potassium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P$$

r_U = peak response of penicillin G from the *Sample solution*

r_S = peak response of penicillin G from the *Standard solution*

C_S = concentration of USP Penicillin G Potassium RS in the *Standard solution* (mg/mL)

C_U = concentration of Penicillin G Potassium in the *Sample solution* (mg/mL)

P = potency of USP Penicillin G Potassium RS (Penicillin G Units/mg)

Acceptance criteria: 1440–1680 Penicillin G Units/mg

SPECIFIC TESTS

- **CRYSTALLINITY (695):** Meets the requirements
- **pH (791)**
 - Sample solution:** 60 mg/mL of Penicillin G Potassium in water
 - Acceptance criteria:** 5.0–7.5
- **LOSS ON DRYING (731)**
 - Sample:** 100 mg of Penicillin G Potassium
 - Analysis:** Dry the *Sample* in a capillary-stoppered bottle under vacuum at 60° for 3 h.
 - Acceptance criteria:** NMT 1.5%
- **BACTERIAL ENDOTOXINS TEST (85):** Where the label states that Penicillin G Potassium is sterile or it must be subjected to further processing during the preparation of injectable dosage forms, it has NMT 0.01 USP Endotoxin Units/100 Penicillin G Units.
- **STERILITY TESTS (71):** Where the label states that Penicillin G Potassium is sterile, it meets the requirements.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.
- **USP REFERENCE STANDARDS (11)**
 - USP Endotoxin RS
 - USP Penicillin G Potassium RS

Penicillin G Potassium Injection**DEFINITION**

Penicillin G Potassium Injection is a sterile isoosmotic solution of Penicillin G Potassium in Water for Injection. It contains one or more suitable buffers and a tonicity-adjusting agent. It contains NLT 90.0% and NMT 115.0% of the labeled number of Penicillin G Units.

IDENTIFICATION

- **A.** The retention time of the penicillin G peak of *Sample solution 1* or *Sample solution 2* corresponds to that of *Standard solution 2*, as obtained in the *Assay*.

ASSAY• **PROCEDURE**

Buffer A: Dissolve 0.8 g of sodium citrate dihydrate in 150 mL of water. Adjust with 0.1 N hydrochloric acid to a pH of 6.8, and dilute with water to 200 mL.

Buffer B: Dissolve 10 g of monobasic potassium phosphate in 900 mL of water, adjust with phosphoric acid to a pH of 4.15, and dilute with water to 1000 mL.

Mobile phase: Methanol and *Buffer B* (450:550)

Standard stock solution: 2000 Penicillin G Units/mL from USP Penicillin G Potassium RS in *Buffer A*

Standard solution 1: 100 Penicillin G Units/mL from *Standard stock solution* in water

Standard solution 2: 200 Penicillin G Units/mL from *Standard stock solution* in water

Standard solution 3: 300 Penicillin G Units/mL from *Standard stock solution* in water

Sample solution 1 (where it is represented as being in a single-dose container): Allow 1 container of Injection to thaw, and mix. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and dilute with water to obtain a solution containing nominally about 200 Penicillin G Units/mL.

Sample solution 2 (where the label states the quantity of penicillin G in a given volume of Injection): Allow 1

container of Injection to thaw, and mix. Dilute a suitable aliquot of the Injection with water to obtain a solution containing nominally about 200 Penicillin G Units/mL.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 4.6-mm × 10-cm; 5-μm packing L1

Flow rate: 1 mL/min

Injection volume: 10 μL

System suitability

Sample: *Standard solution 2*

Suitability requirements

Tailing factor: NMT 2

Relative standard deviation: NMT 2%

Analysis

Samples: *Standard solution 1*, *Standard solution 2*, *Standard solution 3*, and *Sample solution 1* or *Sample solution 2*

Plot the peak responses from the *Standard solutions* versus concentration in Penicillin G Units/mL and draw the straight line best fitting the three plotted points. Calculate the percentage of the labeled number of Penicillin G Units in the portion of Injection taken:

$$\text{Result} = [(N \times D)/L] \times 100$$

- N* = concentration of *Sample solution 1* or *Sample solution 2* determined from the graph (Penicillin G Units/mL)
- D* = dilution factor for *Sample solution 1* or *Sample solution 2* (mL/mL)
- L* = labeled number of Penicillin G Units in Injection (Penicillin G Units/mL)

Acceptance criteria: 90.0%–115.0%

SPECIFIC TESTS

- **BACTERIAL ENDOTOXINS TEST** (85): It contains NMT 0.01 USP Endotoxin Units/100 Penicillin G Units.
- **STERILITY TESTS** (71): It meets the requirements when tested as directed in *Test for Sterility of the Product to Be Examined, Membrane Filtration*.
- **pH** (791): 5.5–8.0
- **PARTICULATE MATTER IN INJECTIONS** (788): Meets the requirements for small-volume injections

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose containers, as described in *Packaging and Storage Requirements* (659). Maintain in the frozen state.
- **LABELING:** It meets the requirements in *Labeling* (7), *Labels and Labeling for Injectable Products*. The label states that it is to be thawed just before use, describes conditions for proper storage of the resultant solution, and directs that the solution is not to be refrozen.
- **USP REFERENCE STANDARDS** (11)
 - USP Endotoxin RS
 - USP Penicillin G Potassium RS

Penicillin G Potassium for Injection

DEFINITION

Penicillin G Potassium for Injection is sterile Penicillin G Potassium or a sterile, dry mixture of Penicillin G Potassium with NLT 4.0% and NMT 5.0% of Sodium Citrate, of which NMT 0.15% may be replaced by Citric Acid. It has a potency of NLT 90.0% and NMT 120.0% of the labeled number of Penicillin G Units. In addition, where it contains Sodium Citrate it has a potency of NLT 1335 and NMT 1595 Penicillin G Units/mg.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHY

Solution A: Acetone, 0.1 M citric acid, and 0.1 M sodium citrate (2:1:1)

Standard solution: Prepare a solution containing the equivalent of 12,000 Penicillin G Units/mL from USP Penicillin G Potassium RS in *Solution A*.

Sample solution: Nominally 12,000 Penicillin G Units/mL from Penicillin G Potassium for Injection in *Solution A*

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 20 μL

Developing solvent system: Toluene, dioxane, and glacial acetic acid (90:25:4)

Spray reagent 1: Starch TS

Spray reagent 2: Iodine TS diluted 1 in 10 with water

Analysis

Samples: *Standard solution* and *Sample solution*

Place the plate in a suitable chromatographic chamber. Develop the chromatogram in the *Developing solvent system* until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow to air-dry. Spray the plate with *Spray reagent 1* followed by *Spray reagent 2*. Penicillin G appears as a white spot on a purple background.

Acceptance criteria: The *R_f* value of the penicillin G spot of the *Sample solution* corresponds to that of the *Standard solution*.

ASSAY

• PROCEDURE

Solution A: 0.01 M monobasic potassium phosphate

Mobile phase: Methanol and *Solution A* (40:60)

System suitability solution: 0.1 mg/mL each of USP Penicillin G Potassium RS and 2-phenylacetamide in water

Standard solution: 0.1 mg/mL of USP Penicillin G Potassium RS in water. This solution contains about 160 Penicillin G Units/mL. Shake as needed to dissolve.

Sample solution 1 (where it is represented as being in a single-dose container): Constitute Penicillin G Potassium for Injection as directed in the labeling. Withdraw all of the withdrawable contents, using a hypodermic needle and syringe, and dilute with water to obtain a solution containing nominally 160 Penicillin G Units/mL.

Sample solution 2 (where the label states the quantity of penicillin G in a given volume of constituted solution): Constitute Penicillin G Potassium for Injection as directed in the labeling. Dilute a suitable aliquot of the constituted solution with water to obtain a solution containing nominally 160 Penicillin G Units/mL.

Sample solution 3 (where it contains sodium citrate): Transfer about 50 mg of the Penicillin G Potassium for Injection to a 500-mL volumetric flask. Add 400 mL of water, and shake to dissolve. Dilute with water to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 10-cm; 5-μm packing L1

Flow rate: 1 mL/min

Injection volume: 10 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for 2-phenylacetamide and penicillin G are about 0.8 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between 2-phenylacetamide and penicillin G, *System suitability solution*

Column efficiency: NLT 1000 theoretical plates, *Standard solution*

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution 1*, *Sample solution 2*, or *Sample solution 3*

Perform the Assay on 10 containers where it is represented as being in a single-dose container and, if necessary, on 10 containers where the label states the quantity of penicillin G in a given volume of constituted solution. Use the individual results to determine the *Uniformity of Dosage Units* and the average of the results as the Assay value.

Calculate the percentage of the labeled number of Penicillin G Units in the container or in the portion of constituted solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times 100$$

r_U = peak response from *Sample solution 1* or *Sample solution 2*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Penicillin G Potassium RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of *Sample solution 1* or *Sample solution 2* (Penicillin G Units/mL)

P = potency of penicillin G in USP Penicillin G Potassium RS (Penicillin G Units/mg)

Calculate the potency, in Penicillin G Units/mg, of the Penicillin G Potassium for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P$$

r_U = peak response from *Sample solution 3*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Penicillin G Potassium RS in the *Standard solution* (mg/mL)

C_U = concentration of Penicillin G Potassium for Injection in *Sample solution 3* (mg/mL)

P = potency of penicillin G in USP Penicillin G Potassium RS (Penicillin G Units/mg)

Acceptance criteria: 90.0%–120.0% of the labeled number of Penicillin G Units. Where Penicillin G Potassium for Injection contains sodium citrate it has a potency of NLT 1335 and NMT 1595 Penicillin G Units/mg.

PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS (905):** Meets the requirements. Perform the Assay on 10 containers where it is represented as being in a single-dose container and, if necessary, on 10 containers where the label states the quantity of penicillin G in a given volume of constituted solution. Use the individual results to determine the *Uniformity of Dosage Units* and the average of the results as the Assay value.

SPECIFIC TESTS

- **INJECTIONS AND IMPLANTED DRUG PRODUCTS (1), Specific Tests, Completeness and clarity of solutions:** At the time of use, it meets the requirements.
- **BACTERIAL ENDOTOXINS TEST (85):** It contains NMT 0.01 USP Endotoxin Units/100 Penicillin G Units.
- **STERILITY TESTS (71):** It meets the requirements when tested as directed in *Test for Sterility of the Product to Be Examined, Membrane Filtration*.
- **CRYSTALLINITY (695):** Meets the requirements
- **PH (791)**

Sample solution: A solution containing 60 mg/mL. Where packaged for dispensing, use the solution constituted as directed in the labeling.

Acceptance criteria: 5.0–7.5. Where it is labeled as containing sodium citrate, the pH is between 6.0 and 8.5.

- **LOSS ON DRYING (731)**

Sample: 100 mg of Penicillin G Potassium for Injection
Analysis: Dry the *Sample* in a capillary-stoppered bottle under vacuum at 60° for 3 h.

Acceptance criteria: NMT 1.5%

- **PARTICULATE MATTER IN INJECTIONS (788):** Meets the requirements for small-volume injections

- **OTHER REQUIREMENTS:** It meets the requirements in *Labeling (7)*, *Labels and Labeling for Injectable Products*.

ADDITIONAL REQUIREMENTS**Change to read:**

- **PACKAGING AND STORAGE:** Preserve as described in *Packaging and Storage Requirements (659)*, *Injection Packaging, Packaging for constitution* (CN 1-May-2017).
- **USP REFERENCE STANDARDS (11)**
USP Endotoxin RS
USP Penicillin G Potassium RS

Penicillin G Potassium for Oral Solution**DEFINITION**

Penicillin G Potassium for Oral Solution is a dry mixture of Penicillin G Potassium and one or more suitable buffers, colors, diluents, flavors, and preservatives. It contains NLT 90.0% and NMT 130.0% of the labeled number of Penicillin G Units when constituted as directed in the labeling.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHY**

Solution A: Acetone, 0.1 M citric acid, and 0.1 M sodium citrate (2:1:1)

Standard solution: Prepare a solution containing the equivalent of 12,000 Penicillin G Units/mL from USP Penicillin G Potassium RS in *Solution A*

Sample solution: Shake a portion of it, containing nominally 100,000 Penicillin G Units, with 8 mL of *Solution A*

Chromatographic system

(See *Chromatography (621)*, *Thin-Layer Chromatography*.)

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 20 µL

Developing solvent system: Toluene, dioxane, and glacial acetic acid (90:25:4)

Spray reagent 1: Starch TS

Spray reagent 2: Iodine TS diluted 1 in 10 with water

Analysis

Samples: *Standard solution* and *Sample solution*

Place the plate in a suitable chromatographic chamber. Develop the chromatogram in the *Developing solvent system* until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow to air-dry. Spray the plate with *Spray reagent 1* followed by *Spray reagent 2*. Penicillin G appears as a white spot on a purple background.

Acceptance criteria: The R_f value of the penicillin G spot of the *Sample solution* corresponds to that of the *Standard solution*.

ASSAY**• PROCEDURE**

Standard solution: Prepare as directed in *Iodometric Assay—Antibiotics* (425), *Standard Preparation*, using USP Penicillin G Potassium RS.

Sample solution: Constitute Penicillin G Potassium for Oral Solution as directed in the labeling using *Buffer B.1* (see *Antibiotics—Microbial Assay* (81), *Media and Solutions, Solutions*). Dilute a suitable aliquot to obtain a solution containing nominally 2000 Penicillin G Units/mL.

Analysis

Samples: *Standard solution* and *Sample solution*

Pipet 2 mL of the *Sample solution* into each of two glass-stoppered, 125-mL conical flasks. Proceed as directed in *Iodometric Assay—Antibiotics* (425), *Procedure*, using one of the flasks to perform the *Blank Determination*.

Calculate the percentage of the labeled number of Penicillin G Units in the portion of Penicillin G Potassium for Oral Solution taken:

$$\text{Result} = (B - I) \times F \times [1/(D \times V)] \times 100$$

B = volume of 0.01 N sodium thiosulfate consumed in the *Blank Determination* (mL)

I = volume of 0.01 N sodium thiosulfate consumed in the *Inactivation and Titration* (mL)

F = equivalency factor as calculated in the chapter (Penicillin G Unit/mL of 0.01 N sodium thiosulfate consumed by the *Standard solution*)

D = nominal concentration of penicillin G in the *Sample solution* (Penicillin G Units/mL)

V = volume of *Sample solution* used for the *Inactivation and Titration* (mL)

Acceptance criteria: 90.0%–130.0%

Penicillin G Potassium Tablets**DEFINITION**

Penicillin G Potassium Tablets contain NLT 90.0% and NMT 120.0% of the labeled number of Penicillin G Units.

IDENTIFICATION**• A. THIN-LAYER CHROMATOGRAPHY**

Diluent: Acetone, 0.1 M citric acid, and 0.1 M sodium citrate (2:1:1)

Standard solution: 12,000 Penicillin G Units/mL from USP Penicillin G Potassium RS in *Diluent*

Sample solution: Nominally 12,500 Penicillin G Units/mL from Tablets in *Diluent*. Pass through a suitable filter.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 20 µL

Developing solvent system: Toluene, dioxane, and glacial acetic acid (90:25:4)

Spray reagent 1: Starch TS

Spray reagent 2: Iodine TS diluted 1 in 10 with water

Analysis

Samples: *Standard solution* and *Sample solution*

Apply the *Sample solution* and the *Standard solution* to the plate, place in a suitable chromatographic chamber, and develop the chromatogram, using the *Developing solvent system*, until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow to air-dry. Spray the plate with *Spray reagent 1* followed by *Spray reagent 2*. Penicillin G appears as a white spot on a purple background.

Acceptance criteria: The *R_f* value of the penicillin G spot from the *Sample solution* corresponds to that from the *Standard solution*.

ASSAY**Change to read:****• PROCEDURE**

Standard solution: Prepare as directed in *Iodometric Assay—Antibiotics* (425), *Standard Preparation*, using USP Penicillin G Potassium RS.

Sample solution: Nominally 2000 Penicillin G Units/mL, prepared as follows. Place NLT 5 Tablets in a high-speed glass blender jar containing a measured volume of *Buffer B.1* (CN 1-May-2017), and blend for 4 ± 1 min.

Dilute a suitable aliquot with *Buffer B.1* (CN 1-May-2017).

Analysis: Proceed as directed in *Iodometric Assay—Antibiotics* (425), *Procedure*, using glass-stoppered, 125-mL conical flasks.

Calculate the percentage of the labeled number of Penicillin G Units in the portion of Tablets taken:

$$\text{Result} = (B - I) \times (F/2) \times (1/C_u) \times 100$$

B = volume of 0.01 N sodium thiosulfate consumed in *Blank Determination* (mL)

I = volume of 0.01 N sodium thiosulfate consumed in *Inactivation and Titration* of the *Sample solution* (mL)

F = factor as calculated in *Iodometric Assay—Antibiotics* (425), *Calculations*

C_u = nominal concentration of penicillin G in the *Sample solution* (Penicillin G Units/mL)

Acceptance criteria: 90.0%–120.0%

PERFORMANCE TESTS**• DISSOLUTION (711)**

Medium: pH 6.0 phosphate buffer (see *Reagents, Indicators, and Solutions—Buffer Solutions*); 900 mL

Apparatus 2: 75 rpm

Time: 60 min

Standard solution: 400 Penicillin G Units/mL from USP Penicillin G Potassium RS in *Medium*

Sample solution: Use a filtered portion of the solution under test.

Solution A: A 1-in-1000 solution of polyoxyethylene (23) lauryl ether in water

Solution B: Dissolve 20 g of hydroxylamine hydrochloride in 5 mL of *Solution A*, and add water to make 1000 mL.

Buffer: 26 mg/mL of sodium hydroxide and 3.1 mg/mL of sodium acetate in water

Ferric nitrate solution: Suspend 233 g of ferric nitrate in about 600 mL of water, add 2.8 mL of sulfuric acid, stir until the ferric nitrate is dissolved, add 1 mL of polyoxyethylene (23) lauryl ether, dilute with water to 1000 mL, and mix.

Apparatus: Automatic analyzer (Figure 1) consisting of (1) a liquid sampler, (2) a proportioning pump, (3) suitable spectrophotometers equipped with matched flow cells and analysis capability at 480 nm, (4) a means of recording spectrophotometric readings and/or a computer for data retrieval and calculation, and (5) a manifold consisting of the components illustrated in the figure.

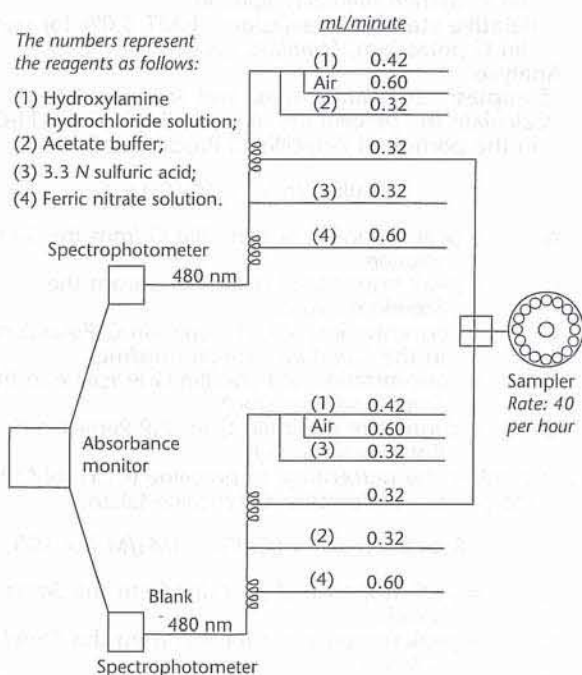

Figure 1

Analysis: With the sample line pumping water, the other lines pumping their respective reagents, and the spectrophotometer set at 480 nm, standardize the system until a steady absorbance baseline has been established. Transfer portions of the *Standard solution* and the *Sample solution* to sampler cups, and place in the sampler. Start the sampler, and conduct determinations of the *Standard solution* and the *Sample solution*, typically at the rate of 40 per h, using a ratio of about 2:1 for sample and wash time.

Calculate the percentage of the labeled amount of Penicillin G Units dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times (1/L) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Penicillin G Potassium RS in the *Standard solution* (Penicillin G Units/mL)

V = volume of *Medium*, 900 mL

L = label claim (Penicillin G Units/Tablet)

Tolerances: NLT 70% (Q) of the labeled amount of Penicillin G Units is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS (11)**
USP Penicillin G Potassium RS

Penicillin G Procaine

Change to read:

$C_{16}H_{18}N_2O_4S \cdot C_{13}H_{20}N_2O_2 \cdot H_2O$ 588.72

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 20 μ L

Developing solvent system: Toluene, dioxane, and glacial acetic acid (90:25:4)

Spray reagent 1: Starch TS

Spray reagent 2: Iodine TS diluted 1 in 10 with water

Spray reagent 3: 50 mg/mL of *p*-dimethylaminobenzaldehyde in methanol

Analysis

Samples: *Standard solution 1*, *Standard solution 2*, and *Sample solution*

Proceed as directed in the chapter. Develop the chromatogram until the solvent has moved three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow to air-dry. Examine the plate under short- and long-wavelength UV light, noting the positions of the spots. Spray the plate with *Spray reagent 1* followed by *Spray reagent 2*. Penicillin G appears as a white spot on a purple background. Spray the location of the spots visualized with UV light with *Spray reagent 3*. Procaine appears as a bright yellow spot.

Acceptance criteria: The R_f value of the penicillin G spot from the *Sample solution* corresponds to that from *Standard solution 1*. The R_f value of the procaine spot from the *Sample solution* corresponds to that from *Standard solution 2*.

ASSAY

Change to read:

• PROCEDURE

Standard solution: Prepare as directed in *Iodometric Assay—Antibiotics* (425), *Standard Preparation*, using USP Penicillin G Potassium RS.

Sample solution: Prepare as directed in *Iodometric Assay—Antibiotics* (425), *Assay Preparation*, except dissolve 100 mg of Penicillin G Procaine in 2.0 mL of methanol, and dilute with *Buffer B.1* (see *Antibiotics—Microbial Assays* (81))^{▲USP40} to obtain a solution containing 2000 Penicillin G Units/mL.

Analysis: Pipet 2 mL of the *Sample solution* into each of two glass-stoppered, 125-mL conical flasks. Use one of these to perform the *Blank Determination*. Proceed as directed in *Iodometric Assay—Antibiotics* (425), *Procedure*.

Calculate the potency, in Penicillin G Units/mg, of the Penicillin G Procaine taken:

$$\text{Result} = (B - I) \times F \times 1/(D \times V) \times 100$$

B = volume of 0.01 N sodium thiosulfate consumed in the *Blank Determination* (mL)

I = volume of 0.01 N sodium thiosulfate consumed in the *Inactivation and Titration* (mL)

F = equivalency factor as calculated in *Procedure* in the chapter (Penicillin G Units/mL of 0.01 N sodium thiosulfate consumed by the *Standard solution*)

D = nominal concentration of Penicillin G in the *Sample solution* (Penicillin G Units/mL)

V = volume of the *Sample solution* used for the *Inactivation and Titration* (mL)

Acceptance criteria: 900–1050 Penicillin G Units/mg

SPECIFIC TESTS

Change to read:

• CONTENT OF PENICILLIN G AND PROCAINE

Solution A: [▲]Phosphoric acid diluted 1 in 10 with water^{▲USP40}

Mobile phase: Dissolve 14 g of monobasic potassium phosphate and 6.5 g of [▲]tetrabutylammonium hydroxide, 40% in water, [▲]USP40 in 700 mL of water. Adjust with 1 N potassium hydroxide to a pH of 7.0, and dilute with water to 1000 mL. Mix 500 mL of this solution, 250 mL of acetonitrile, and 250 mL of water. Adjust with 1 N potassium hydroxide or *Solution A* to a pH of 7.5 ± 0.05 , and pass through a suitable filter.

Standard solution: 0.8 mg/mL of USP Penicillin G Potassium RS and 0.54 mg/mL of USP Procaine Hydrochloride RS in *Mobile phase*

System suitability solution: 2.4 mg/mL of [▲]USP Penicillin V Potassium RS^{▲USP40} in *Mobile phase*. Mix the resultant solution with *Standard solution* (1:3).

Sample solution: Transfer 70 mg of Penicillin G Procaine to a 50-mL volumetric flask. Add 30 mL of *Mobile phase*, sonicate to dissolve, and dilute with *Mobile phase* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 235 nm

Column: [▲]3.9-mm^{▲USP40} × 30-cm; 10-μm packing L1

Flow rate: 1 mL/min

Injection volume: 10 μL

System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—[▲]The relative retention times for procaine, penicillin G, and penicillin V are about 0.4, 1.0, and 1.5, respectively.^{▲USP40}]

Suitability requirements

Resolution: NLT 2.0 between penicillin G and penicillin V, *System suitability solution*

Relative standard deviation: NMT 3.0% for penicillin G potassium, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of penicillin G (C₁₆H₁₈N₂O₄S) in the portion of Penicillin G Procaine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times G_S$$

r_U = peak response of penicillin G from the *Sample solution*

r_S = peak response of penicillin G from the *Standard solution*

C_S = concentration of USP Penicillin G Potassium RS in the *Standard solution* (mg/mL)

C_U = concentration of Penicillin G Procaine in the *Sample solution* (mg)

G_S = content of penicillin G in USP Penicillin G Potassium RS (%)

Calculate the percentage of procaine (C₁₃H₂₀N₂O₂) in the portion of Penicillin G Procaine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of procaine from the *Sample solution*

r_S = peak response of procaine from the *Standard solution*

C_S = concentration of USP Procaine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = concentration of Penicillin G Procaine in the *Sample solution* (mg)

M_{r1} = molecular weight of procaine, 236.32

M_{r2} = molecular weight of procaine hydrochloride, 272.78

Acceptance criteria: See *Table 1*.

Table 1

Penicillin G	51.0%–59.6%
Procaine	37.5%–43.0%

- **BACTERIAL ENDOTOXINS TEST (85):** Where the label states that Penicillin G Procaine is sterile or that it must be subjected to further processing during the preparation of injectable dosage forms, it contains NMT 0.01 USP Endotoxin Unit/100 Penicillin G Units.

Change to read:

- **STERILITY TESTS (71):** Where the label states that Penicillin G Procaine is sterile, it meets the requirements. [▲]If the test for *Membrane Filtration* is used, perform the procedure as directed in the chapter with the following exceptions. Use *Fluid A* to which has been added sufficient sterile penicillinase to inactivate the penicillin G, and swirl the vessel until solution is complete before filtering.^{▲USP40}

- **CRYSTALLINITY** (695): Meets the requirements

Change to read:

- **pH** (791)
Sample solution: A saturated ^{▲USP40} solution containing about 300 mg/mL of Penicillin G Procaine in water
Acceptance criteria: 5.0–7.5

USP Endotoxin RS
USP Penicillin G Potassium RS
[▲]USP Penicillin V Potassium RS ^{▲USP40}
USP Procaine Hydrochloride RS

Penicillin G Procaine Intramammary Infusion

» Penicillin G Procaine Intramammary Infusion is a suspension of Penicillin G Procaine in a suitable vegetable oil vehicle. It may contain one or more buffers, dispersants, preservatives, and thickening agents. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of penicillin G.

Packaging and storage—Preserve in well-closed disposable syringes.

Labeling—Label it to indicate that it is for veterinary use only.

USP Reference standards (11)—
USP Penicillin G Potassium RS
USP Penicillin G Procaine RS

Identification—Transfer a portion of it, equivalent to about 100,000 Penicillin G Units, to a test tube, add 25 mL of methanol, and shake. Allow to separate, and use the methanol layer as the test solution. Prepare a Standard solution of USP Penicillin G Procaine RS in methanol containing about 4.5 mg per mL. Apply separately 10 μ L of each solution to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of butanol, isopropyl alcohol, acetone, and water (4:4:2:2) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Expose the plate to iodine vapors in a closed chamber for about 15 minutes, and locate the spots: the R_f values and colors of the two principal spots

obtained from the test solution correspond to those obtained from the Standard solution.

Water Determination, Method I (921): not more than 1.4%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

Change to read:

Assay—Proceed as directed under *Antibiotics—Microbial Assays* (81), expelling the contents of 1 syringe of Intramammary Infusion into a high-speed glass blender jar containing 499.0 mL of [•]Buffer B.1 [•](CN 1-May-2017) and 1.0 mL of polysorbate 80, and blending for 3 to 5 minutes. Allow to stand for about 10 minutes, and dilute an accurately measured volume of the aqueous phase quantitatively and stepwise with [•]Buffer B.1 [•](CN 1-May-2017) to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

Penicillin G Procaine Injectable Suspension

» Penicillin G Procaine Injectable Suspension is a sterile suspension of Penicillin G, Procaine or, where labeled for veterinary use only of sterile penicillin G procaine, in Water for Injection and contains one or more suitable buffers dispersants, or suspending agents, and a suitable preservative. It may contain procaine hydrochloride in a concentration not exceeding 2.0 percent, and may contain one or more suitable stabilizers. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of penicillin G, the labeled amount being not less than 300,000 Penicillin G Units per mL or per container.

Packaging and storage—Preserve in single-dose or multiple-dose containers, preferably of Type I or Type III glass, in a refrigerator.

Labeling—Where it is intended for veterinary use only, the label so states.

USP Reference standards (11)—
USP Endotoxin RS
USP Penicillin G Potassium RS
USP Procaine Hydrochloride RS

Identification—It responds to the *Identification* test under *Penicillin G Procaine*.

Crystallinity (695) (where it is prepared from penicillin G procaine and is labeled for veterinary use only): meets the requirements, the dried residue prepared as directed in the test for *Penicillin G and procaine contents* being used.

Bacterial Endotoxins Test (85)—It contains not more than 0.01 USP Endotoxin Unit per 100 Penicillin G Units.

Sterility Tests (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*, except to use a portion of specimen from each container equivalent to 300,000 Penicillin G Units, instead of the minimum volume specified in the *Table 2, Minimum Quantity to be Used for Each Medium*, and to use *Fluid A* to which has been added sufficient sterile penicillinase to inactivate the penicillin G and to swirl the vessel until solution is complete before filtering. If the Injectable Suspension contains lecithin, use *Fluid D*. If it contains carboxymethylcellulose sodium, add sufficient sterile carboxymethylcellulase to *Fluid A* or *Fluid D* to dissolve the

carboxymethylcellulose sodium before filtering. If it does not dissolve completely, proceed as directed for *Direct Inoculation of the Culture Medium* under *Test for Sterility of the Product to be Examined*, except to use Fluid Thioglycollate Medium and Soybean-Casein Digest Medium containing an amount of sterile penicillinase sufficient to inactivate the penicillin G in each vessel.

pH (791): between 5.0 and 7.5.

Penicillin G and procaine contents (where it is prepared from penicillin G procaine and is labeled for veterinary use only)—Dilute a portion of it, equivalent to about 300,000 Penicillin G Units, with water to obtain a volume of 10 mL, centrifuge, and remove and discard the supernatant. Resuspend the sediment in 10 mL of water, centrifuge, and remove and discard the supernatant. Dry the sediment in a vacuum desiccator containing silica gel for 18 hours at a temperature not exceeding 25°. The dried material meets the requirements of the test for *Penicillin G and procaine contents* under *Penicillin G Procaine*. [NOTE—Reserve a portion of the dried material for the test for *Crystallinity*.]

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Change to read:

Assay—

Standard preparation—Using USP Penicillin G Potassium RS, prepare as directed for *Standard preparation* under *Iodometric Assay—Antibiotics* (425).

Assay preparation 1 (where it is represented as being in a single-dose container)—Withdraw all of the withdrawable contents of the Injectable Suspension, using a suitable hypodermic needle and syringe, and dilute quantitatively with **Buffer B.1** (CN 1-May-2017) to obtain a solution containing about 2000 Penicillin G Units per mL. Pipet 2 mL of this solution into each of two glass-stoppered, 125-mL conical flasks.

Assay preparation 2 (where the label states the quantity of penicillin G procaine in a given volume of Injectable Suspension)—Dilute an accurately measured volume of Injectable Suspension quantitatively with **Buffer B.1** (CN 1-May-2017) to obtain a solution containing about 2000 Penicillin G Units per mL. Pipet 2.0 mL of this solution into each of two glass-stoppered, 125-mL conical flasks.

Procedure—Proceed as directed for *Procedure* under *Iodometric Assay—Antibiotics* (425). Calculate the quantity, in Penicillin G Units, in the container, or in the portion of Injectable Suspension taken, by the formula:

$$(L / 2D)(F)(B - I)$$

in which *L* is the labeled quantity in Penicillin G Units, in the container, or in the volume of Injectable Suspension taken; and *D* is the concentration, in Penicillin G Units per mL, of *Assay preparation 1*, or of *Assay preparation 2*, on the basis of the labeled quantity in the container, or in the portion of Injectable Suspension taken, respectively, and the extent of dilution.

Penicillin G Procaine for Injectable Suspension

» Penicillin G Procaine for Injectable Suspension is a sterile mixture of Penicillin G Procaine and

one or more suitable buffers, dispersants, or suspending agents, and preservatives. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of penicillin G, the labeled amount being not less than 300,000 Penicillin G Units per container or per mL of constituted Suspension.

Packaging and storage—Preserve in single-dose or multiple-dose containers, preferably of Type I or Type III glass.

USP Reference standards (11)—

USP Endotoxin RS

USP Penicillin G Potassium RS

USP Procaine Hydrochloride RS

Identification—It responds to the *Identification* test under *Penicillin G Procaine*.

pH (791): between 5.0 and 7.5, when constituted as directed in the labeling.

Water Determination, Method I (921): between 2.8% and 4.2%.

Other requirements—It meets the requirements for *Bacterial endotoxins* and *Sterility* under *Penicillin G Procaine Injectable Suspension*. It meets also the requirements under *Injections and Implanted Drug Products* (1) and *Uniformity of Dosage Units* (905).

Change to read:

Assay—

Standard preparation—Using USP Penicillin G Potassium RS, prepare as directed for *Standard preparation* under *Iodometric Assay—Antibiotics* (425).

Assay preparation 1 (where it is represented as being in a single-dose container)—Constitute Penicillin G Procaine for Injectable Suspension as directed in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and dilute quantitatively with **Buffer B.1** (CN 1-May-2017) to obtain a solution containing about 2000 Penicillin G Units per mL. Pipet 2 mL of this solution into each of two glass-stoppered, 125-mL conical flasks.

Assay preparation 2 (where the label states the quantity of penicillin G procaine in a given volume of constituted suspension)—Constitute Penicillin G Procaine for Injectable Suspension as directed in the labeling. Dilute an accurately measured volume of the constituted injectable suspension quantitatively with **Buffer B.1** (CN 1-May-2017) to obtain a solution containing about 2000 Penicillin G Units per mL. Pipet 2 mL of this solution into each of two glass-stoppered, 125-mL conical flasks.

Procedure—Proceed as directed for *Procedure* under *Iodometric Assay—Antibiotics* (425). Calculate the quantity, in Penicillin G Units, in the container, or in the portion of constituted injectable suspension taken by the formula:

$$(L / 2D)(F)(B - I)$$

in which *L* is the labeled quantity, in Penicillin G Units, in the container, or in the volume of constituted injectable suspension taken, and *D* is the concentration, in Penicillin G Units per mL, of *Assay preparation 1* or of *Assay preparation 2* on the basis of the labeled quantity in the container or in the portion of constituted injectable suspension taken, respectively, and the extent of dilution.

Penicillin G Procaine and Dihydrostreptomycin Sulfate Intramammary Infusion

» Penicillin G Procaine and Dihydrostreptomycin Sulfate Intramammary Infusion is a suspension of Penicillin G Procaine and Dihydrostreptomycin Sulfate in a suitable vegetable oil vehicle. It may contain suitable gelling and thickening agents. It contains not less than 90.0 percent and not more than 120.0 percent of the labeled amounts of Penicillin G Units and of dihydrostreptomycin ($C_{21}H_{41}N_7O_{12}$).

Packaging and storage—Preserve in well-closed, disposable syringes.

Labeling—Label it to indicate that it is intended for veterinary use only.

USP Reference standards (11)—
USP Dihydrostreptomycin Sulfate RS
USP Penicillin G Potassium RS
USP Penicillin G Procaine RS

Identification—

A: It responds to the *Identification* test under *Penicillin G Procaine Intramammary Infusion*.

B: Place a portion of it, equivalent to about 100 mg of dihydrostreptomycin, in a separator, add 20 mL of chloroform and 20 mL of water, and shake by mechanical means for 15 minutes. Allow to separate, and discard the lower chloroform layer. Repeat the extraction with a 20-mL portion of chloroform, discarding the chloroform layer. Use the aqueous layer as the test solution. Prepare a Standard solution of USP Dihydrostreptomycin Sulfate RS in water containing 6.5 mg per mL. Apply separately 30 μ L of each solution to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of *n*-propyl alcohol, water, pyridine, and glacial acetic acid (15:12:10:2) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Spray the plate with a reagent prepared by dissolving 2 g of ninhydrin in 100 mL of alcohol and adding 20 mL of glacial acetic acid, heat the plate at 110° for 10 minutes, and examine the chromatograms: the R_f value and color of the principal spot obtained from the test solution correspond to those obtained from the Standard solution.

Water Determination, *Method I* (921): not more than 1.4%, 20 mL of a mixture of toluene and methanol (7:3) being used in the titration vessel in place of methanol.

Assay for penicillin G—

Standard preparation—Using USP Penicillin G Potassium RS, prepare as directed for *Standard preparation* under *Iodometric Assay—Antibiotics* (425).

Assay preparation—Dilute an accurately measured volume of Injectable Suspension quantitatively with **Buffer B.1** (CN 1, May-2017) to obtain a solution containing about 2000 Penicillin G Units per mL. Pipet 2 mL of this solution into each of two glass-stoppered, 125-mL conical flasks.

Procedure—Proceed as directed for *Procedure* under *Iodometric Assay—Antibiotics* (425), except in the *Blank Determination* to add 0.1 mL of 1.2 N hydrochloric acid immediately before the 10.0 mL of 0.01 N iodine VS. Calculate the quantity, in Penicillin G Units, in the portion of Injectable Suspension taken by the formula:

$$(L / 2D)(F)(B - I)$$

in which *L* is the labeled quantity, in Penicillin G Units, in the volume of Injectable Suspension taken, and *D* is the concentration, in Penicillin G Units per mL, of the *Assay preparation*, on the basis of the labeled quantity in the portion of Injectable Suspension taken and the extent of dilution, and the other terms are as defined therein.

Assay for dihydrostreptomycin—Proceed as directed for the turbidimetric assay for dihydrostreptomycin under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of Injectable Suspension diluted quantitatively with water to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

Penicillin G Procaine, Dihydrostreptomycin Sulfate, Chlorpheniramine Maleate, and Dexamethasone Injectable Suspension

» Penicillin G Procaine, Dihydrostreptomycin Sulfate, Chlorpheniramine Maleate, and Dexamethasone Injectable Suspension is a sterile suspension of Penicillin G Procaine and Dexamethasone in a solution of Sterile Dihydrostreptomycin Sulfate and Chlorpheniramine Maleate in Water for Injection. It contains one or more suitable buffers, preservatives, and dispersing or suspending agents. It may contain Procaine Hydrochloride in a concentration not exceeding 2.0 percent, and it may contain one or more suitable stabilizers. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amounts of Penicillin G Units and of dihydrostreptomycin ($C_{21}H_{41}N_7O_{12}$), and not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of chlorpheniramine maleate ($C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$) and of dexamethasone ($C_{22}H_{29}FO_5$).

Packaging and storage—Preserve in single-dose or multiple-dose, tight containers, in a cool place.

Labeling—Label it to indicate that it is intended for veterinary use only.

USP Reference standards (11)—

USP Chlorpheniramine Maleate RS
USP Dexamethasone RS
USP Dihydrostreptomycin Sulfate RS
USP Endotoxin RS
USP Penicillin G Potassium RS
USP Penicillin G Procaine RS

Identification—

A: Transfer, with the aid of water, a portion of the Injectable Suspension, freshly mixed and free from air bubbles, equivalent to about 400,000 Penicillin G Units, to a separator, add 50 mL of chloroform, and shake by mechanical means for 15 minutes. Allow to separate, and filter the lower chloroform layer through about 4 g of anhydrous sodium sulfate supported on a pledget of glass wool, collecting the filtrate in a 100-mL volumetric flask. Repeat the extraction with two 25-mL portions of chloroform, combining the filtrates in the 100-mL volumetric flask. Dilute with chloroform to volume, and mix. [NOTE—Retain the aqueous phase for *Identification test B.*] Prepare a Standard solution of USP Penicillin G Procaine RS in chloroform containing about 4.5 mg per mL. Apply separately 10 μ L of each solution to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of butanol, isopropyl alcohol, acetone, and water (4:4:2:2) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Expose the plate to iodine vapors in a closed chamber for about 15 minutes, and locate the spots: the *R_F* values and colors of the two principal spots obtained from the test solution correspond to those obtained from the Standard solution.

B: Dilute the aqueous phase retained from *Identification test A* with water to obtain a test solution containing about 5 mg of dihydrostreptomycin per mL. Prepare a Standard solution of USP Dihydrostreptomycin Sulfate RS in water containing 6.5 mg per mL. Apply separately 30 μ L of each solution to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of *n*-propyl alcohol, water, pyridine, and glacial acetic acid (15:12:10:2) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Spray the plate with a reagent prepared by dissolving 2 g of ninhydrin in 100 mL of alcohol and adding 20 mL of glacial acetic acid, heat the plate at 110° for 10 minutes, and examine the chromatograms: the *R_F* value and color of the principal spot obtained from the test solution correspond to those obtained from the Standard solution.

C: The chromatogram of the *Assay preparation* obtained as directed in the *Assay for chlorpheniramine maleate* exhibits a major peak for chlorpheniramine, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation* similarly determined, both relative to the internal standard.

D: The chromatogram of the *Assay preparation* obtained as directed in the *Assay for dexamethasone* exhibits a major peak for dexamethasone, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation* similarly determined, both relative to the internal standard.

Bacterial Endotoxins Test (85)—It contains not more than 0.01 Endotoxin Unit per 100 Penicillin G Units.

pH (791): between 5.0 and 6.0.

Other requirements—It meets the requirements of the test for *Sterility* under *Penicillin G Procaine and Dihydrostreptomycin Sulfate Injectable Suspension*, and the requirements under *Injections and Implanted Drug Products* (1).

Change to read:

Assay for penicillin G—

Standard preparation—Using USP Penicillin G Potassium RS, prepare as directed for *Standard preparation* under *Iodometric Assay—Antibiotics* (425).

Assay preparation—Dilute an accurately measured volume of Injectable Suspension, freshly mixed and free from air bubbles, quantitatively with **Buffer B.1** (CN 1-May-2017) to yield a solution containing about 2000 Penicillin G Units per mL. Pipet 2 mL of this solution into each of two glass-stoppered, 125-mL conical flasks.

Procedure—Proceed as directed for *Procedure* under *Iodometric Assay—Antibiotics* (425), except in the *Blank Determination* to add 0.1 mL of 1.2 N hydrochloric acid immediately before the 10.0 mL of 0.01 N iodine VS. Calculate the quantity, in Penicillin G Units, in the portion of Injectable Suspension taken by the formula:

$$(L / 2D)(F(B - I))$$

in which *L* is the labeled quantity, in Penicillin G Units, in the volume of Injectable Suspension taken, and *D* is the concentration, in Penicillin G Units per mL, of the *Assay preparation*, on the basis of the labeled quantity in the portion of Injectable Suspension taken and the extent of dilution, and the other terms are as defined therein.

Assay for dihydrostreptomycin—Proceed as directed for the turbidimetric assay for dihydrostreptomycin under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of Injectable Suspension, freshly mixed and free from air bubbles, diluted quantitatively with water to yield a *Test Dilution* having a concentration of dihydrostreptomycin assumed to be equal to the median dose level of the *Standard*.

Assay for chlorpheniramine maleate—

Internal standard solution—Prepare a solution of brompheniramine maleate in water having a concentration of about 7 mg per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Chlorpheniramine Maleate RS in water to obtain a stock solution having a known concentration of about 6 mg per mL. Transfer 5.0 mL of this solution to a 50-mL centrifuge tube. Add 5.0 mL of *Internal standard solution*, and adjust with sodium hydroxide solution (1 in 20) to a pH of about 10. Add 25.0 mL of hexanes, place the cap on the tube, shake for about 2 minutes, and centrifuge. Use the upper hexanes layer as the *Standard preparation*.

Assay preparation—Transfer an accurately measured volume of Injectable Suspension, freshly mixed and free from air bubbles, equivalent to about 30 mg of chlorpheniramine maleate, to a 50-mL centrifuge tube. Proceed as directed under *Standard preparation*, beginning with "Add 5.0 mL of *Internal standard solution*." Use the upper hexanes layer as the *Assay preparation*.

Chromatographic system (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector, and contains a 4-mm × 1.8-m glass column packed with 1.2% liquid phase G16 and 0.5% potassium hydroxide on 100- to 120-mesh support S1A. The column is maintained isothermally at about 180°, and the injection port and the detector block are maintained at about 200°. Dry nitrogen is used as the carrier gas at a flow rate of about 50 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Proce-*

cedure: the resolution, *R*, between the analyte and internal standard peaks is not less than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 1.5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.75 for chlorpheniramine and 1.0 for brompheniramine. Calculate the quantity, in mg, of chlorpheniramine maleate (C₁₆H₁₉ClN₂ · C₄H₄O₄) in each mL of the Injectable Suspension taken by the formula:

$$5(C / V)(R_u / R_s)$$

in which *C* is the concentration of USP Chlorpheniramine Maleate RS in the stock solution used to prepare the *Standard preparation*, *V* is the volume, in mL, of Injectable Suspension taken, and *R_u* and *R_s* are the peak response ratios of the chlorpheniramine maleate peak to the internal standard peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Assay for dexamethasone—

Mobile phase—Prepare a suitable filtered mixture of water and acetonitrile (2:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Internal standard solution—Dissolve about 30 mg of beclomethasone in 2 mL of methanol in a 50-mL volumetric flask, dilute with methylene chloride to volume, and mix.

Standard preparation—Transfer about 25 mg of USP Dexamethasone RS, accurately weighed, to a 50-mL volumetric flask. Add about 1 mL of methanol, swirl to dissolve, dilute with methylene chloride to volume, and mix. Transfer 5.0 mL of this solution to a suitable flask, and add 5.0 mL of *Internal standard solution*. Heat the flask on a steam bath, and evaporate under a stream of nitrogen just to dryness. Add 10.0 mL of methanol to the flask, and swirl to dissolve the residue. This *Standard preparation* contains about 0.25 mg of USP Dexamethasone RS and 0.3 mg of beclomethasone per mL.

Assay preparation—Transfer an accurately measured volume of Injectable Suspension, freshly mixed and free from air bubbles, equivalent to about 2.5 mg of dexamethasone, to a separator containing 50 mL of 0.1 N hydrochloric acid, add 5.0 mL of *Internal standard solution*, and extract with four 25-mL portions of methylene chloride, combining the extracts in a second separator. Wash the combined extracts with 50 mL of sodium bicarbonate solution (1 in 20), filtering the lower methylene chloride layer through about 4 g of anhydrous sodium sulfate supported on a cotton pledget previously washed with methylene chloride, and collecting the filtrate in a suitable flask. Wash the aqueous layer with 25 mL of methylene chloride, and filter the lower methylene chloride layer through the same filter, collecting the filtrate in the same flask. Heat the flask on a steam bath, and evaporate under a stream of nitrogen just to dryness. Add 10.0 mL of methanol, and swirl to dissolve the residue.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains packing L1. The flow rate is about 1.2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution, *R*, of the analyte and the internal standard peaks is not less than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.8 for dexamethasone and 1.0 for beclomethasone. Calculate the quantity, in mg, of dex-

amethasone ($C_{22}H_{29}FO_5$) in each mL of the Injectable Suspension taken by the formula:

$$10(C/V)(R_U/R_S)$$

in which C is the concentration, in mg per mL, of USP Dexamethasone RS in the *Standard preparation*, V is the volume, in mL, of Injectable Suspension taken, and R_U and R_S are the peak response ratios of the dexamethasone peak to the internal standard peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Penicillin G Procaine, Dihydrostreptomycin Sulfate, and Prednisolone Injectable Suspension

» Penicillin G Procaine, Dihydrostreptomycin Sulfate, and Prednisolone Injectable Suspension is a sterile suspension of Penicillin G Procaine and Prednisolone in a solution of Dihydrostreptomycin Sulfate in Water for Injection. It contains one or more suitable buffers, dispersants, preservatives, and suspending agents. It may contain not more than 2.0 percent of procaine hydrochloride, and one or more suitable stabilizing agents. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled number of Penicillin G Units, not less than 90.0 percent and not more than 115.0 percent of the labeled amount of dihydrostreptomycin ($C_{21}H_{41}N_7O_{12}$), and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of prednisolone ($C_{21}H_{28}O_5$).

Packaging and storage—Preserve in single-dose or multiple-dose, tight containers.

Labeling—Label it to indicate that it is intended for veterinary use only, and is not to be used in animals to be slaughtered for human consumption.

USP Reference standards (11)—
USP Dihydrostreptomycin Sulfate RS
USP Endotoxin RS
USP Penicillin G Potassium RS
USP Prednisolone RS

Identification—It responds to *Identification tests A and B* under *Penicillin G Procaine, Dihydrostreptomycin Sulfate, Chlorpheniramine Maleate, and Dexamethasone Injectable Suspension*.

Bacterial Endotoxins Test (85)—It contains not more than 0.01 Endotoxin Unit per 100 Penicillin G Units.

Other requirements—It meets the requirements of the test for *Sterility*, and for *pH* under *Penicillin G Procaine and Dihydrostreptomycin Sulfate Injectable Suspension*.

Change to read:

Assay for penicillin G—

Standard preparation—Using USP Penicillin G Potassium RS, prepare as directed for *Standard preparation* under *Iodometric Assay—Antibiotics* (425).

Assay preparation—Dilute an accurately measured volume of Injectable Suspension quantitatively with *Buffer B.1* (CN.1. May-2017) to obtain a solution containing about 2000 Penicillin G Units per mL. Pipet 2 mL of this solution into each of two glass-stoppered, 125-mL conical flasks.

Procedure—Proceed as directed for *Procedure* under *Iodometric Assay—Antibiotics* (425), except in the *Blank Determination* to add 0.1 mL of 1.2 N hydrochloric acid immediately before the 10.0 mL of 0.01 N iodine VS. Calculate the quantity, in Penicillin G Units, in the portion of Injectable Suspension taken by the formula:

$$(L/2D)(F(B-I))$$

in which L is the labeled quantity, in Penicillin G Units, in the volume of Injectable Suspension taken, D is the concentration, in Penicillin G Units per mL, of the *Assay preparation*, on the basis of the labeled quantity in the portion of Injectable Suspension taken and the extent of dilution, and the other terms are as defined therein.

Assay for dihydrostreptomycin—Proceed as directed for the turbidimetric assay for dihydrostreptomycin as directed under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of Injectable Suspension diluted quantitatively with water to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

Assay for prednisolone—

Standard preparation—Prepare as directed for *Standard Preparation* under *Single-steroid Assay* (511), using USP Prednisolone RS.

Assay preparation—Transfer to a separator an accurately measured volume of Injectable Suspension, and add 15 mL of water. Extract with three 25-mL portions and finally with one 20-mL portion of chloroform, filtering each portion through chloroform-washed cotton into a 100-mL volumetric flask. Add chloroform to volume, and mix. Pipet 20 mL of this solution into a suitable glass-stoppered flask or tube, evaporate the chloroform on a steam bath just to dryness, cool, and dissolve the residue in 2.0 mL, accurately measured, of a mixture of equal volumes of chloroform and alcohol.

Procedure—Proceed as directed for *Single-Steroid Assay* (511), using *Solvent A* to develop the chromatogram. Calculate the quantity, in mg, of prednisolone ($C_{21}H_{28}O_5$) in each mL of the Injectable Suspension taken by the formula:

$$0.01(C/V)(A_U/A_S)$$

in which the terms are as defined therein.

Penicillin G Procaine, Neomycin and Polymyxin B Sulfates, and Hydrocortisone Acetate Topical Suspension

» Penicillin G Procaine, Neomycin and Polymyxin B Sulfates, and Hydrocortisone Acetate Topical Suspension is a suspension of Penicillin G Procaine, Neomycin Sulfate, Polymyxin B Sulfate and Hydrocortisone Acetate in Peanut Oil or Sesame Oil. It may contain one or more suitable dispersing and suspending agents. It contains not less than 90.0 percent and not more than 140.0 percent of the labeled amounts of Penicillin G Units, of neomycin, and of polymyxin B Units, and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hydrocortisone acetate ($C_{23}H_{32}O_6$).

Packaging and storage—Preserve in well-closed containers.

Labeling—Label it to indicate that it is intended for veterinary use only.

USP Reference standards (11)—

USP Hydrocortisone Acetate RS
USP Neomycin Sulfate RS
USP Penicillin G Potassium RS
USP Polymyxin B Sulfate RS

Water Determination, Method I (921): not more than 1.0%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

Change to read:

Assay for penicillin G—Proceed as directed for penicillin G under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of Topical Suspension blended for 2 minutes in a high-speed glass blender jar with 499.0 mL of *Buffer B.1* (CN 1-May-2017) and 1.0 mL of polysorbate 80. Allow to stand for 10 minutes, and dilute an accurately measured volume of the aqueous phase quantitatively and stepwise with *Buffer B.1* (CN 1-May-2017) to obtain a *Test Dilution* having a concentration of penicillin G assumed to be equal to the median dose level of the Standard.

Change to read:

Assay for neomycin—Proceed as directed for neomycin under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of Topical Suspension shaken in a separator with about 50 mL of ether, and extracted with four 20-mL portions of *Buffer B.3* (CN 1-May-2017). Combine the aqueous extracts, and dilute with *Buffer B.3* (CN 1-May-2017) to an appropriate volume to obtain a stock solution. To an accurately measured volume of this stock solution add an accurately measured volume of penicillinase sufficient to inactivate the penicillin G therein, heat at 37° for 30 minutes, and dilute quantitatively and stepwise with *Buffer B.3* (CN 1-May-2017) to obtain a *Test Dilution* having a concentration of neomycin assumed to be equal to the median dose level of the Standard.

Change to read:

Assay for polymyxin B—Proceed as directed for polymyxin B under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of Topical Suspension blended for 2 minutes in a high-speed glass blender jar containing 499.0 mL of *Buffer B.6* (CN 1-May-2017) and 1.0 mL of polysorbate 80. Allow to stand for 10 minutes, and to an accurately measured volume of the aqueous phase add an accurately measured volume of penicillinase sufficient to inactivate the penicillin G therein. Heat the solution at 37° for 30 minutes, and dilute quantitatively and stepwise with *Buffer B.6* (CN 1-May-2017) to obtain a *Test Dilution* having a concentration of polymyxin assumed to be equal to the median dose level of the Standard. Add to each test dilution of the Standard a quantity of USP Neomycin Sulfate RS dissolved in *Buffer B.6* (CN 1-May-2017) to obtain the same concentration of neomycin present in the *Test Dilution*.

Assay for hydrocortisone acetate—Using an accurately measured volume of Topical Suspension, proceed as directed in the Assay under *Hydrocortisone Acetate Lotion*.

Penicillin G Procaine and Novobiocin Sodium Intramammary Infusion

» Penicillin G Procaine and Novobiocin Sodium Intramammary Infusion is a suspension of Penicillin G Procaine and Novobiocin Sodium in a suitable vegetable oil vehicle. It contains a suitable preservative and suspending agent. It contains not less than 90.0 percent and not more than 125.0 percent of the labeled amounts of Penicillin G Units and novobiocin ($C_{31}H_{36}N_2O_{11}$).

Packaging and storage—Preserve in disposable syringes that are well-closed containers.

Labeling—Label it to indicate that it is for veterinary use only.

USP Reference standards (11)—

USP Novobiocin RS
USP Penicillin G Potassium RS

Water Determination, Method I (921): not more than 1.0%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

Change to read:

Assay for penicillin G—Proceed as directed for penicillin G under *Antibiotics—Microbial Assays* (81), except to use *Staphylococcus aureus* ATCC No. 12692 as the test organism. Prepare the inoculum by growing the organism at 32° to 35° for 24 hours on Medium 1 to which has been added a solution of novobiocin sodium, containing the equivalent of 2.5 mg of novobiocin per mL that has been filtered through a membrane filter having a 0.2-μm porosity, so that the medium contains the equivalent of 10 μg of novobiocin per mL. Use an inoculum composition of about 5 mL of stock suspension in each 100 mL of Medium 1. Expel the contents of a syringe of Intramammary Infusion into a high-speed glass blender jar containing 1.0 mL of polysorbate 80 and 499.0 mL of *Buffer B.1* (CN 1-May-2017), and blend for 3 to 5 minutes. Allow to stand for 10 minutes, and dilute an accurately measured volume of the aqueous phase quantitatively and stepwise with *Buffer B.1* (CN 1-May-2017) to obtain a *Test Dilution* having a concentration of penicillin G assumed to be equal to the median dose level of the Standard.

Change to read:

Assay for novobiocin—Proceed as directed for novobiocin under *Antibiotics—Microbial Assays* (81), expelling the contents of a syringe of Intramammary Infusion into a high-speed blender jar containing 1.0 mL of polysorbate 80 and 499.0 mL of *Buffer B.3* (CN 1-May-2017), and blend for 3 to 5 minutes. Allow to stand for 10 minutes. To an accurately measured volume of the aqueous phase add sufficient penicillinase to inactivate the penicillin G therein, and dilute quantitatively and stepwise with *Buffer B.6* (CN 1-May-2017) to obtain a *Test Dilution* having a concentration of novobiocin assumed to be equal to the median dose level of the Standard. [NOTE—Store this *Test Dilution* at 37° for 30 minutes and allow to cool before using it to fill the cylinders on the plates.]

Penicillin G Sodium

$C_{16}H_{17}N_2NaO_4S$ 356.7
 4-Thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, 3,3-dimethyl-7-oxo-6-[(phenylacetyl)amino]-, [2S-(2 α ,5 α ,6 β)], monosodium salt;
 Monosodium (2S,5R,6R)-3,3-dimethyl-7-oxo-6-(2-phenylacetamido)-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate [69-57-8].

DEFINITION

Penicillin G Sodium has a potency of NLT 1500 and NMT 1750 Penicillin G Units/mg.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B. IDENTIFICATION TESTS—GENERAL** (191), *Sodium*: Meets the requirements

ASSAY

• PROCEDURE

Solution A: 0.01 M monobasic potassium phosphate

Mobile phase: Methanol and *Solution A* (40:60)

System suitability solution: 0.1 mg/mL each of USP Penicillin G Potassium RS and 2-phenylacetamide in water

Standard solution: 0.1 mg/mL of USP Penicillin G Potassium RS in water. Shake as needed to dissolve. This solution contains about 160 Penicillin G Units/mL.

Sample solution: 0.1 mg/mL of Penicillin G Sodium in water

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm \times 10-cm; 5- μ m packing L1

Flow rate: 1 mL/min

Injection volume: 10 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for 2-phenylacetamide and penicillin G are about 0.8 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between 2-phenylacetamide and penicillin G, *System suitability solution*

Column efficiency: NLT 1000 theoretical plates, *Standard solution*

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the potency of penicillin G sodium, in Penicillin G Units/mg, in the portion of Penicillin G Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P$$

r_U = peak response of penicillin G from the *Sample solution*

r_S = peak response of penicillin G from the *Standard solution*

C_S = concentration of USP Penicillin G Potassium RS in the *Standard solution* (mg/mL)

C_U = concentration of Penicillin G Sodium in the *Sample solution* (mg/mL)

P = potency of penicillin G in USP Penicillin G Potassium RS (Penicillin G Units/mg)

Acceptance criteria: 1500–1750 Penicillin G Units/mg

SPECIFIC TESTS

- **CRYSTALLINITY** (695): Meets the requirements
- **PH** (791)
Sample solution: 60 mg/mL of Penicillin G Sodium in water
Acceptance criteria: 5.0–7.5
- **LOSS ON DRYING** (731)
Sample: 100 mg of Penicillin G Sodium
Analysis: Dry the *Sample* in a capillary-stoppered bottle under a vacuum at a pressure NMT 5 mm of mercury at 60° for 3 h.
Acceptance criteria: NMT 1.5%
- **STERILITY TESTS** (71): Where the label states that Penicillin G Sodium is sterile, it meets the requirements when tested as directed in *Test for Sterility of the Product to Be Examined*, *Membrane Filtration*.
- **BACTERIAL ENDOTOXINS TEST** (85): Where the label states that Penicillin G Sodium is sterile or it must be subjected to further processing during the preparation of injectable dosage forms, it contains NMT 0.01 USP Endotoxin Units/100 Penicillin G Units.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.
- **USP REFERENCE STANDARDS** (11)
 USP Endotoxin RS
 USP Penicillin G Potassium RS
 USP Penicillin G Sodium RS

Penicillin G Sodium for Injection

DEFINITION

Penicillin G Sodium for Injection is sterile Penicillin G Sodium or a sterile mixture of Penicillin G Sodium and NLT 4.0% and NMT 5.0% of Sodium Citrate, of which NMT 0.15% may be replaced by Citric Acid. It contains NLT 90.0% and NMT 120.0% of the labeled amount of penicillin G. In addition, where it contains Sodium Citrate, it has a potency of NLT 1420 and NMT 1667 Penicillin G Units/mg.

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHY

Solution A: Acetone, 0.1 M citric acid, and 0.1 M sodium citrate (2:1:1)

Standard solution: Prepare a solution containing the equivalent of 12,000 Penicillin G Units/mL from USP Penicillin G Potassium RS in *Solution A*.

Sample solution: Nominally 12,000 Penicillin G Units/mL from Penicillin G Sodium for Injection in *Solution A*

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 20 μ L

Developing solvent system: Toluene, dioxane, and glacial acetic acid (90:25:4)

Spray reagent 1: Starch TS

Spray reagent 2: Iodine TS diluted 1 in 10 with water

Analysis

Samples: *Standard solution* and *Sample solution*

Place the plate in a suitable chromatographic chamber. Develop the chromatogram using the *Developing sol-*

vent system until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow to air-dry. Spray the plate with *Spray reagent 1* followed by *Spray reagent 2*. Penicillin G appears as a white spot on a purple background.

Acceptance criteria: The R_f value of the penicillin G spot from the *Sample solution* corresponds to that from the *Standard solution*.

ASSAY

• PROCEDURE

Solution A: 0.01 M monobasic potassium phosphate

Mobile phase: Methanol and *Solution A* (40:60)

System suitability solution: 0.1 mg/mL each of USP Penicillin G Potassium RS and 2-phenylacetamide in water

Standard solution: 0.1 mg/mL of USP Penicillin G Potassium RS in water. Shake as needed to dissolve. This solution contains about 160 Penicillin G Units/mL.

Sample solution 1 (where it is represented as being in a single-dose container): Constitute Penicillin G Sodium for Injection as directed in the labeling. Withdraw all of the withdrawable contents, using a hypodermic needle and syringe, and dilute with water to obtain a solution containing nominally 160 Penicillin G Units/mL.

Sample solution 2 (where the label states the quantity of penicillin G in a given volume of constituted solution): Constitute Penicillin G Sodium for Injection as directed in the labeling. Dilute a suitable aliquot of the constituted solution with water to obtain a solution containing nominally 160 Penicillin G Units/mL.

Sample solution 3 (where it contains sodium citrate): Transfer about 50 mg of the Penicillin G Sodium for Injection to a 500-mL volumetric flask, add about 400 mL of water, and shake to dissolve. Dilute with water to volume, and mix.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 10-cm; 5-μm packing L1

Flow rate: 1 mL/min

Injection volume: 10 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for 2-phenylacetamide and penicillin G are about 0.8 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between 2-phenylacetamide and penicillin G, *System suitability solution*

Column efficiency: NLT 1000 theoretical plates, *Standard solution*

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution 1*, *Sample solution 2*, or *Sample solution 3*

Perform the Assay on 10 containers where it is represented as being in a single-dose container and, if necessary, on 10 containers where the label states the quantity of penicillin G in a given volume of constituted solution. Use the individual results to determine the *Uniformity of Dosage Units* and the average of the results as the Assay value.

Calculate the percentage of the labeled amount of penicillin G in the container or in the portion of constituted solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times 100$$

- r_U = peak response from *Sample solution 1* or *Sample solution 2*
 r_S = peak response from the *Standard solution*
 C_S = concentration of USP Penicillin G Potassium RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of *Sample solution 1* or *Sample solution 2* (Penicillin G Units/mL)
 P = potency of penicillin G in USP Penicillin G Potassium RS (Penicillin G Units/mg)

Calculate the potency, in Penicillin G Units/mg, in the portion of Penicillin G Sodium for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P$$

- r_U = peak response from *Sample solution 3*
 r_S = peak response from the *Standard solution*
 C_S = concentration of USP Penicillin G Potassium RS in the *Standard solution* (mg/mL)
 C_U = concentration of Penicillin G Sodium for Injection in *Sample solution 3* (mg/mL)
 P = potency of penicillin G in USP Penicillin G Potassium RS (Penicillin G Units/mg)

Acceptance criteria: 90.0%–120.0% of the labeled amount of penicillin G. Where Penicillin G Sodium for Injection contains sodium citrate, it has a potency of NLT 1420 and NMT 1667 Penicillin G Units/mg.

PERFORMANCE TESTS

- UNIFORMITY OF DOSAGE UNITS (905):** Meets the requirements. Perform the Assay on 10 containers where it is represented as being in a single-dose container and, if necessary, on 10 containers where the label states the quantity of penicillin G in a given volume of constituted solution. Use the individual results to determine the *Uniformity of Dosage Units* and the average of the results as the Assay value.

SPECIFIC TESTS

- INJECTIONS AND IMPLANTED DRUG PRODUCTS (1), Specific Tests, Completeness and clarity of solutions:** At the time of use, it meets the requirements.
- CRYSTALLINITY (695):** Meets the requirements
- STERILITY TESTS (71):** It meets the requirements when tested as directed in *Test for Sterility of the Product to Be Examined, Membrane Filtration*.
- BACTERIAL ENDOTOXINS TEST (85):** It contains NMT 0.01 USP Endotoxin Units/100 Penicillin G Units.
- PH (791)**
Sample solution: A solution containing 60 mg/mL
Acceptance criteria: 5.0–7.5. Where it is labeled as containing sodium citrate, the pH is between 6.0 and 7.5.
- LOSS ON DRYING (731)**
Sample: 100 mg of Penicillin G Sodium for Injection
Analysis: Dry the *Sample* in a capillary-stoppered bottle under vacuum at a pressure NMT 5 mm of mercury at 60° for 3 h.
Acceptance criteria: NMT 1.5%
- PARTICULATE MATTER IN INJECTIONS (788):** Meets the requirements for small-volume injections
- LABELING (7), Labels and Labeling for Injectable Products:** Meets the requirements

ADDITIONAL REQUIREMENTS

Change to read:

- PACKAGING AND STORAGE:** Preserve as described in *Packaging and Storage Requirements* (659), *Injection Packaging, Packaging for constitution* (CN 1-May-2017).

• **USP REFERENCE STANDARDS (11)**

- USP Endotoxin RS

System suitability

Samples: System suitability solution and Standard solution

[NOTE—The relative retention times for *p*-hydroxyphenicillin V, penicillin G, and penicillin V are about 0.4, 0.8, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 3.0 between penicillin G and penicillin V, System suitability solution

Column efficiency: NLT 1800 theoretical plates, System suitability solution

Relative standard deviation: NMT 1.0% for penicillin V potassium, Standard solution

Analysis

Samples: Standard solution and Sample solution

Calculate the potency of penicillin V potassium, in Penicillin V Units/mg, in the portion of Penicillin V taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times P$$

r_u = sum of the peak responses of *p*-hydroxyphenicillin V and penicillin V from the Sample solution

r_s = sum of the peak responses of *p*-hydroxyphenicillin V and penicillin V from the Standard solution

C_s = concentration of USP Penicillin V Potassium RS in the Standard solution (mg/mL)

C_u = concentration of Penicillin V in the Sample solution (mg/mL)

P = potency of penicillin V in USP Penicillin V Potassium RS (Penicillin V Units/mg)

Acceptance criteria: 1525–1780 Penicillin V Units/mg

IMPURITIES

• **LIMIT OF PHENOXYACETIC ACID**

Mobile phase: Acetonitrile, glacial acetic acid, and water (35:1:65)

Diluent: pH 6.6 phosphate buffer (see Reagents, Indicators, and Solutions—Buffer Solutions)

Standard solution: 0.1 mg/mL of phenoxyacetic acid in Diluent

Sample solution: 20.0 mg/mL of Penicillin V in Diluent. Use this solution on the day prepared.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Flow rate: 1 mL/min

Injection volume: 20 μ L

System suitability

Sample: Standard solution

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of phenoxyacetic acid in the portion of Penicillin V taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak area of phenoxyacetic acid from the Sample solution

r_s = peak area of phenoxyacetic acid from the Standard solution

C_s = concentration of phenoxyacetic acid in the Standard solution (mg/mL)

C_u = concentration of Penicillin V in the Sample solution (mg/mL)

Acceptance criteria: NMT 0.5%

• **LIMIT OF *p*-HYDROXYPENICILLIN V**

Mobile phase, System suitability solution, Standard solution, Sample solution, Chromatographic system and System suitability: Proceed as directed in the Assay.

Analysis

Sample: Sample solution

Calculate the percentage of *p*-hydroxyphenicillin V in the portion of Penicillin V taken:

$$\text{Result} = (r_u/r_T) \times 100$$

r_u = peak response of *p*-hydroxyphenicillin V from the Sample solution

r_T = sum of the peak responses of *p*-hydroxyphenicillin V and penicillin V

Acceptance criteria: NMT 5.0%

SPECIFIC TESTS

- **CRYSTALLINITY (695):** Meets the requirements

- **PH (791)**

Sample solution: Prepare a suspension containing 30 mg/mL of Penicillin V in water

Acceptance criteria: 2.5–4.0

- **WATER DETERMINATION** (921), *Method I*: NMT 2.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in tight containers.
- **LABELING**: Label it to indicate that it is to be used in the manufacture of nonparenteral drugs only.
- **USP REFERENCE STANDARDS** (11)
 - USP Penicillin G Potassium RS
 - USP Penicillin V RS
 - USP Penicillin V Potassium RS

Penicillin V for Oral Suspension

DEFINITION

Penicillin V for Oral Suspension is a dry mixture of Penicillin V with or without one or more suitable buffers, colors, flavors, and suspending agents. It contains NLT 90.0% and NMT 120.0% of the labeled number of Penicillin V Units when constituted as directed.

IDENTIFICATION

- **A.** The retention time of the penicillin V peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• PROCEDURE

Mobile phase: Acetonitrile, glacial acetic acid, and water (350: 5.75: 650)

System suitability solution: 2.5 mg/mL each of USP Penicillin G Potassium RS and USP Penicillin V Potassium RS in *Mobile phase*

Standard solution: 2.5 mg/mL of USP Penicillin V Potassium RS in *Mobile phase*

Sample solution: Constitute Penicillin V for Oral Suspension as directed in the labeling. Transfer a suitable aliquot, freshly mixed and free from air bubbles, and containing about 400,000 Penicillin V Units to a suitable volumetric flask. Dilute with *Mobile phase* to volume, and mix to obtain a solution containing nominally about 4000 Penicillin V Units/mL. Pass a portion of this solution through a suitable filter of 0.5- μ m or finer pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4-mm \times 30-cm; packing L1

Flow rate: 1 mL/min

Injection volume: 10 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for *p*-hydroxypenicillin V, penicillin G, and penicillin V are about 0.4, 0.8, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 3.0 between penicillin G and penicillin V, *System suitability solution*

Column efficiency: NLT 1800 theoretical plates for penicillin V, *System suitability solution*

Relative standard deviation: NMT 1.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled number of Penicillin V Units in the portion of Penicillin V for Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times 100$$

r_U = sum of the peak responses of *p*-hydroxypenicillin V and penicillin V from the *Sample solution*

r_S = sum of the peak responses of *p*-hydroxypenicillin V and penicillin V from the *Standard solution*

C_S = concentration of USP Penicillin V Potassium RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of penicillin V in the *Sample solution* (Penicillin V Units/mL)

P = potency of penicillin V in USP Penicillin V Potassium RS (Penicillin V Units/mg)

Acceptance criteria: 90.0%–120.0%

PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS** (905)

For solids packaged in single-unit containers: Meets the requirements

- **DELIVERABLE VOLUME** (698): Meets the requirements

SPECIFIC TESTS

- **PH** (791)

Sample solution: Constitute as directed in the labeling.

Acceptance criteria: 2.0–4.0

- **WATER DETERMINATION** (921), *Method I*: NMT 1.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in tight containers.
- **LABELING**: It may be labeled in terms of the weight of penicillin V contained therein, in addition to or instead of Units, on the basis that 1600 Penicillin V Units are equivalent to 1 mg of penicillin V.
- **USP REFERENCE STANDARDS** (11)
 - USP Penicillin G Potassium RS
 - USP Penicillin V RS
 - USP Penicillin V Potassium RS

Penicillin V Tablets

DEFINITION

Penicillin V Tablets contain NLT 90.0% and NMT 120.0% of the labeled number of Penicillin V Units.

IDENTIFICATION

- **A.** The retention time of the penicillin V peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• PROCEDURE

Mobile phase: Acetonitrile, glacial acetic acid, and water (350: 5.75: 650)

System suitability solution: 2.5 mg/mL each of USP Penicillin G Potassium RS and USP Penicillin V Potassium RS in *Mobile phase*

Standard solution: 2.5 mg/mL of USP Penicillin V Potassium RS in *Mobile phase*

Sample solution: Nominally 4000 Penicillin V Units/mL, in *Mobile phase* dissolved from finely powdered Tablets (NLT 20). Shake for about 5 min. Pass a portion of the solution through a suitable filter of 0.5- μ m or finer pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4-mm \times 30-cm; packing L1

Flow rate: 1 mL/min

Injection volume: 10 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for *p*-hydroxypenicillin V, penicillin G, and penicillin V are about 0.4, 0.8, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 3.0 between penicillin G and penicillin V, *System suitability solution*

Column efficiency: NLT 1800 theoretical plates, *System suitability solution*

Relative standard deviation: NMT 1.0% for penicillin V potassium, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled number of Penicillin V Units in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times P \times 100$$

r_u = sum of the peak responses of *p*-hydroxypenicillin V and penicillin V from the *Sample solution*

r_s = sum of the peak responses of *p*-hydroxypenicillin V and penicillin V from the *Standard solution*

C_s = concentration of USP Penicillin V Potassium RS in the *Standard solution* (mg/mL)

C_u = nominal concentration of penicillin V in the *Sample solution* (Penicillin V Units/mL)

P = potency of penicillin V in USP Penicillin V Potassium RS (Penicillin V Units/mg)

Acceptance criteria: 90.0%–120.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Time: 45 min

Standard solution: USP Penicillin V Potassium RS in *Medium*

Sample solution: Sample per *Dissolution* (711). Dilute with *Medium*, if necessary, to a concentration that is similar to the *Standard solution*.

Tolerances: NLT 75% (Q) of the labeled amount of penicillin V ($C_{16}H_{18}N_2O_5S$) is dissolved.

• UNIFORMITY OF DOSAGE UNITS (905):

Meet the requirements

SPECIFIC TESTS

• WATER DETERMINATION (921), *Method I*: NMT 3.0%

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE:

Preserve in tight containers.

• LABELING:

The Tablets may be labeled in terms of the weight of penicillin V contained therein, in addition to or instead of Units, on the basis that 1600 Penicillin V Units are equivalent to 1 mg of penicillin V.

• USP REFERENCE STANDARDS (11)

USP Penicillin G Potassium RS

USP Penicillin V RS

USP Penicillin V Potassium RS

6 β], compd. with *N,N'*-bis(phenylmethyl)-1,2-ethanediamine (2:1).

(2*S*,5*R*,6*R*)-3,3-Dimethyl-7-oxo-6-(2-phenoxyacetamido)-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid compound with *N,N'*-dibenzylethylenediamine (2:1) [5928-84-7].

Tetrahedrate 1013.21 [63690-57-3].

» Penicillin V Benzathine has a potency of not less than 1060 and not more than 1240 Penicillin V Units per mg.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Penicillin V Potassium RS

Crystallinity (695): meets the requirements.

pH (791): between 4.0 and 6.5, in a suspension containing about 30 mg per mL.

Water Determination, Method I (921): between 5.0% and 8.0%.

Penicillin V content—Transfer about 40 mg, accurately weighed, to a 100-mL volumetric flask, add methanol to volume, and mix. Concomitantly determine the absorbances of this solution and of a similarly prepared Standard solution prepared with about 30 mg of USP Penicillin V Potassium RS at the wavelength of maximum absorbance at about 276 nm. Determine the percentage of penicillin V taken by the formula:

$$P(a_u / a_s)$$

in which P is the percentage content of penicillin V in the USP Penicillin V Potassium RS, and a_u and a_s are the absorptivities of the solution of the specimen and the Standard solution, respectively: between 62.3% and 72.5% is found.

Assay—

Standard preparation—Prepare as directed for *Standard preparation* under *Iodometric Assay—Antibiotics* (425), using USP Penicillin V Potassium RS.

Assay preparations—Dissolve a quantity of Penicillin V Benzathine in 1.0 N sodium hydroxide to obtain a solution containing 2000 Penicillin V Units per mL. Pipet 2 mL of this solution into a glass-stoppered, 125-mL conical flask, and use as the *Assay preparation* for *Inactivation and titration*. Dilute a quantity of Penicillin V Benzathine quantitatively with water to obtain a suspension containing 2000 Penicillin V Units per mL. Pipet 2 mL of this suspension into a glass-stoppered, 125-mL conical flask, and use as the *Assay preparation* for the *Blank determination*.

Procedure—Proceed as directed for *Procedure* under *Iodometric Assay—Antibiotics* (425), except in the *Inactivation and titration* of the specimen to omit the addition of 2.0 mL of 1.0 N sodium hydroxide. Calculate the potency, in Penicillin V Units per mg, in the Penicillin V Benzathine taken by the formula:

$$(F)(B - I) / (2D)$$

in which D is the concentration, in mg per mL, of the *Assay preparation* for *Inactivation and titration* on the basis of the weight of Penicillin V Benzathine taken and the extent of dilution.

Penicillin V Benzathine

$(C_{16}H_{18}N_2O_5S)_2 \cdot C_{16}H_{20}N_2$ 941.12

4-Thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, 3,3-dimethyl-7-oxo-6-[(2-phenoxyacetyl)amino]-, [2*S*-(2 α ,5 α ,

Penicillin V Benzathine Oral Suspension

» Penicillin V Benzathine Oral Suspension contains not less than 90.0 percent and not more than 120.0 percent of the labeled number of

Penicillin V Units per mL. It contains one or more suitable buffers, colors, dispersants, flavors, and preservatives.

Packaging and storage—Preserve in tight containers, and store in a refrigerator.

Labeling—It may be labeled in terms of the weight of penicillin V contained therein, in addition to or instead of Units, on the basis that 1600 Penicillin V Units are equivalent to 1 mg of penicillin V.

USP Reference standards (11)—

USP Penicillin V Potassium RS

Uniformity of dosage units (905)—

FOR SUSPENSION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

Deliverable volume (698): meets the requirements.

pH (791): between 6.0 and 7.0.

Assay—

Standard preparation—Prepare as directed for *Standard preparation under Iodometric Assay—Antibiotics* (425), using USP Penicillin V Potassium RS.

Assay preparations—Dilute an accurately measured volume of Oral Suspension, freshly mixed and free from air bubbles, quantitatively with 1.0 N sodium hydroxide to obtain a solution containing 2000 Penicillin V Units per mL. Pipet 2 mL of this solution into a glass-stoppered, 125-mL conical flask, and use as the *Assay preparation for Inactivation and titration*. Dilute an accurately measured volume of Oral Suspension quantitatively with water to obtain a suspension containing 2000 Penicillin V Units per mL. Pipet 2 mL of this suspension into a glass-stoppered, 125-mL conical flask, and use as the *Assay preparation for the Blank determination*.

Procedure—Proceed as directed for *Procedure under Iodometric Assay—Antibiotics* (425), except in the *Inactivation and titration* to omit the addition of 2.0 mL of 1.0 N sodium hydroxide. Calculate the quantity, in Penicillin V Units, in each mL of the Oral Suspension taken by the formula:

$$(T/2D)(B - I)$$

in which *T* is the labeled quantity, in Penicillin V Units per mL, in the Oral Suspension, and *D* is the concentration, in Penicillin V Units per mL, in the *Assay preparation for Inactivation and titration* on the basis of the volume of Oral Suspension taken and the extent of dilution.

Penicillin V Potassium

$C_{16}H_{17}KN_2O_5S$ 388.48
4-Thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, 3,3-dimethyl-7-oxo-6-[(phenoxymethyl)amino]-, monopotassium salt, [2S-(2 α ,5 α ,6 β)]-;
Monopotassium (2S,5R,6R)-3,3-dimethyl-7-oxo-6-(2-phenoxymethylamino)-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate [132-98-9].

DEFINITION

Penicillin V Potassium has a potency of NLT 1380 and NMT 1610 Penicillin V Units/mg.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the penicillin V peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.
- **C.**

Diluent: Glycerin and water (25:14)

Solution A: 106 mg/mL of sodium carbonate in water

Solution B: 120 mg/mL of sodium sulfide in *Diluent*, prepared as follows. Dissolve sodium sulfide in *Diluent*, using about 45% of the final volume and heat. Allow to cool, and dilute with *Diluent* to the final volume.

Solution C: 150 mg/mL of tartaric acid in water

Sample solution: 0.1 g of Penicillin V Potassium in 2 mL of water

Analysis

Part 1: Add 1 mL of *Solution A* to the *Sample solution* and heat.

Part 2: To the hot solution from *Part 1* add 0.05 mL of *Solution B*.

Part 3: Cool the mixture from *Part 2* in iced water and add 2 mL of *Solution C*. Allow to stand.

Acceptance criteria: Meets the requirements for *Parts 1, 2, and 3*

Part 1: No precipitate is formed.

Part 2: No precipitate is formed.

Part 3: A white precipitate is formed.

Sample solution: Sample per *Dissolution* (711). Dilute with *Medium* to a concentration that is similar to the *Standard solution*.

Analysis: Determine the percentage of the labeled number of Penicillin V Units dissolved by a suitable validated spectrophotometric analysis of a filtered portion of the solution under test.

Tolerances: NLT 75% (Q) of the labeled number of Penicillin V Units is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

SPECIFIC TESTS• **LOSS ON DRYING** (731)

Sample: 100 mg

Analysis: Dry the *Sample* in a capillary-stoppered bottle under vacuum at 60° for 3 h.

Acceptance criteria: NMT 1.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in tight containers.
- **LABELING**: Label the chewable Tablets to indicate that they are to be chewed before swallowing. The Tablets may be labeled in terms of the weight of penicillin V contained therein, in addition to or instead of Units, on the basis that 1600 Penicillin V Units are equivalent to 1 mg of penicillin V.

Pentamidine Isethionate

$C_{19}H_{24}N_4O_2 \cdot (C_2H_6O_4S)_2$ 592.68
Ethanesulfonic acid, 2-hydroxy-, compd. with 4,4'-[1,5-pentanediyldis(oxy)]bis[benzenecarboximidamide]; 4,4'-(Pentane-1,5-diylbis(oxy))dibenzimidamide bis(2-hydroxyethanesulfonate) [140-64-7].

DEFINITION

Pentamidine Isethionate contains NLT 98.5% and NMT 101.5% of $C_{19}H_{24}N_4O_2 \cdot (C_2H_6O_4S)_2$, calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**
- **B. OXYGEN-FLASK COMBUSTION (471)**
Barium chloride solution: 60 mg/mL of barium chloride in water
Analysis: Burn 150 mg, using 10 mL of 3% hydrogen peroxide as the absorbing liquid. When the process is complete, acidify with 1 mL of diluted hydrochloric acid, and add 1 mL of the Barium chloride solution. Acceptance criteria: A white precipitate is formed.
- **C.** The retention time of the pentamidine isethionate peak of the Sample solution corresponds to that of the Standard solution, as obtained in the test for Organic Impurities.

ASSAY

- **PROCEDURE**
Sample solution: 5 mg/mL in dimethylformamide. Add 0.25 mL of thymol blue TS.
Analysis: Titrate under a stream of nitrogen with 0.1 M tetrabutylammonium hydroxide VS, determining the endpoint until the color changes to intense blue. Perform a blank determination, and make any necessary correction (see *Titrimetry* (541)). Each mL of 0.1 M tetrabutylammonium hydroxide is equivalent to 29.63 mg of $C_{19}H_{24}N_4O_2 \cdot (C_2H_6O_4S)_2$.
Acceptance criteria: 98.5%–101.5% on the dried basis

RESIDUE ON IGNITION (281)

Acceptance criteria: NMT 0.1% on a 1-g sample

Organic Impurities

PROCEDURE

Buffer: 30 mg/mL of ammonium acetate in water, adjusted with triethylamine to a pH of 7.5
Mobile phase: Methanol and Buffer (65:35)
System suitability solution: Prepare 40.0 mL of a 2.5 mg/mL solution of USP Pentamidine Isethionate RS in water. Adjust with 0.2 M sodium hydroxide to a pH of 10.5, and boil under reflux for 20 min. Cool, and dilute with water to 50.0 mL. Transfer quantitatively 1 mL of this solution to a 50-mL volumetric flask, and dilute with Mobile phase to volume.

Standard solution: 2 µg/mL of USP Pentamidine Isethionate RS in Mobile phase

Sample solution: 1.0 mg/mL of Pentamidine Isethionate in Mobile phase. [NOTE—It must be demonstrated that the final product does not contain a detectable amount of alkyl 2-hydroxyethanesulphonates, a potential in-process impurity.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 265 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Flow rate: 1 mL/min

Injection size: 10 µL

Run time: 3.5 times the retention time of pentamidine

System suitability

Sample: System suitability solution

Suitability requirements

Resolution: NLT 2 between the two major peaks.

[NOTE—The chromatogram shows two major peaks.]

Analysis

Samples: Standard solution and Sample solution

Acceptance criteria

Individual impurities: NMT 0.4%. [NOTE—Exclude any other peak producing a response of less than 0.02%.]

Total impurities: NMT 0.7%

SPECIFIC TESTS

- **PH (791):** 4.5–6.5, in a carbon dioxide-free aqueous solution containing 50 mg/mL of Pentamidine Isethionate

Pentazocine and Acetaminophen Tablets**DEFINITION**

Pentazocine and Acetaminophen Tablets contain an amount of Pentazocine Hydrochloride equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of pentazocine ($C_{19}H_{27}NO$) and NLT 90.0% and NMT 110.0% of the labeled amount of acetaminophen ($C_8H_9NO_2$).

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** (201)
Diluent: Chloroform and methanol (1:1)
Standard solution A: 1 mg/mL of USP Pentazocine RS in *Diluent*
Standard solution B: 26 mg/mL of USP Acetaminophen RS in *Diluent*
Sample solution: Transfer a quantity of finely powdered Tablets, nominally equivalent to about 5 mg of pentazocine and 130 mg of acetaminophen, to a suitable flask. Add 5 mL of *Diluent*, shake, and allow the solids to settle. Use the supernatant.

Chromatographic system

Developing solvent system: Ethyl acetate, methanol, and formic acid (90:5:5)

Spray reagent: Dissolve 300 mg of platinum chloride in 100 mL of water and add 100 mL of potassium iodide solution (6 in 100).

Analysis: Evaporate the solvents in cool, circulating air. After developing and examining the spots, spray the plate with *Spray reagent*.

Acceptance criteria: The R_f values, size, and intensity of color of the two principal spots of the *Sample solution* correspond to those of *Standard solution A* and *Standard solution B*.

ASSAY**Change to read:**• **PENTAZOCINE**

Mobile phase: Chloroform, methanol, and isopropylamine (960:40:2)

Diluent: Methanol and 0.035 N sulfuric acid (1:1)

Standard stock solution: 0.5 mg/mL of USP

Pentazocine RS in *Diluent*

Standard solution: Transfer 10.0 mL of the *Standard stock solution* to a 125-mL separator. Add 30 mL of water and 5 mL of sodium carbonate solution (1:10). Extract with 60 mL of chloroform and pass the chloroform layer through filter paper, collecting the filtrate in a 100-mL volumetric flask. Dilute with chloroform to volume and mix.

Sample solution: Transfer an amount nominally equivalent to 25 mg of pentazocine, from NLT 20 finely powdered Tablets, to a 50-mL glass-stoppered cylinder. Add 50.0 mL of *Diluent* and shake intermittently for 15 min. Sonicate for about 2 min, allow the solids to settle, and transfer 10.0 mL of the supernatant to a 125-mL separator. [NOTE—Save the remainder of the supernatant for use in the Assay for *Acetaminophen*. Minimize the waiting period before this test is performed to prevent significant hydrolysis of acetaminophen to *p*-aminophenol.]

Add 30 mL of water and 5 mL of sodium carbonate solution (1:10) to the separator and mix. Extract with 60 mL of chloroform and pass the chloroform layer through filter paper, collecting the filtrate in a 100-mL volumetric flask. Dilute with chloroform to volume and mix.

Pentazocine and Aspirin Tablets

DEFINITION

Pentazocine and Aspirin Tablets contain an amount of Pentazocine Hydrochloride equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of pentazocine ($C_{19}H_{27}NO$) and NLT 90.0% and NMT 110.0% of the labeled amount of aspirin ($C_9H_8O_4$).

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)

Diluent: Chloroform and methanol (1:1)

Standard solution A: 2.5 mg/mL of USP Pentazocine RS in *Diluent*

Standard solution B: 65 mg/mL of USP Aspirin RS in *Diluent*

Sample solution: Shake a quantity of finely powdered Tablets, nominally equivalent to about 25 mg of pentazocine and 650 mg of aspirin, with 10 mL of *Diluent* in an ultrasonic bath for 2 min. Allow the solids to settle.

Chromatographic system

Developing solvent system: Ethyl acetate, methanol, and formic acid (90:5:5)

Spray reagent: Iodoplatinate spray reagent. Dissolve 300 mg of platinum chloride in 100 mL of water, and add 100 mL of potassium iodide solution (6 in 100).

Analysis: Evaporate the solvents from the spots in warm circulating air. Place the plate in the developing chamber, and after developing the plate, remove it, and mark the solvent front. Evaporate the solvents thoroughly in warm circulating air, and examine the plate under short-wavelength UV light. Expose the plate to iodine vapor for about 5 min, and observe. Then spray the plate with *Spray reagent*.

Acceptance criteria: Two principal spots from the *Sample solution* correspond in R_f values, size, and intensity of color with the pentazocine spot of *Standard solution A* and the aspirin spot of *Standard solution B*, respectively.

ASSAY

• PROCEDURE

Diluent A: Methanol and water (1:1)

Diluent B: Methanol and 6 N hydrochloric acid (1:1)

Diluent C: Water, methanol, and 6 N hydrochloric acid (6:1:1)

Chromatographic column: Use a 200-mm tube consisting of about a 90-mm length of 22-mm tubing fused to about a 100-mm length of 5-mm tubing having a stopcock at the bottom of this section. Place a pledget of glass wool at the bottom of the 5-mm portion just above the stopcock. Transfer a suitable quantity of sulfonic acid cation-exchange resin to a beaker, and wash three times with water, discarding the water wash each time by decantation. Cover the resin with *Diluent B*, and allow to stand for 1 h. Decant the acid wash; if it is colored yellow or orange, repeat this step until the wash is almost colorless. Then wash the resin by repeated 15-min soakings in *Diluent A* followed by decantation until the wash is neutral to wide-range indicator paper. Fill the tube to a height of 100 mm with slurry of the washed resin in *Diluent A*. Wash the column with 25 mL of *Diluent A*.

Standard solution A: 18 μ g/mL of USP Salicylic Acid RS in 0.1 N sodium hydroxide

Standard solution B: 62.5 μ g/mL of USP Pentazocine RS in *Diluent C*

Sample stock solution A: Transfer a portion of fine powder from NLT 20 freshly powdered Tablets, nominally equivalent to about 25 mg of pentazocine and 650 mg of aspirin from NLT 20 finely powdered Tablets, to a suitable 250-mL flask. Add 100.0 mL of *Diluent A*, and shake by mechanical means for 20 min. Centrifuge a suitable quantity for 5 min.

Sample stock solution B: Transfer 25.0 mL of the clear supernatant from *Sample stock solution A* to the prepared *Chromatographic column*, followed by five 10-mL portions of *Diluent A*, collecting the eluate in a 250-mL volumetric flask containing 10.0 mL of 2.5 N sodium hydroxide. Dilute with water to volume, and mix.

Sample solution A: Pipet 4 mL of *Sample stock solution B* into a 100-mL volumetric flask, and dilute with 0.1 N sodium hydroxide to volume, and mix.

Sample solution B: Pass through the column after *Sample stock solution B* five 5-mL portions of *Diluent B*, followed by 10 mL of water. Collect the eluate in a 100-mL volumetric flask, and dilute with water to volume.

Instrumental conditions

Mode: UV

Analytical wavelength: 296 nm (maximum absorbance) for the analysis of aspirin; 278 nm (maximum absorbance) for the analysis of pentazocine

Cell: 1 cm

Blank: 0.1 N sodium hydroxide for the analysis of aspirin; *Diluent C* for the analysis of pentazocine

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Sample solution A*, and *Sample solution B*

Calculate the percentage of aspirin ($C_9H_8O_4$) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

A_U = absorbance from *Sample solution A*

A_S = absorbance from *Standard solution A*

C_S = concentration of USP Salicylic Acid RS in *Standard solution A* ($\mu\text{g/mL}$)

C_U = nominal concentration of aspirin in *Sample solution A* ($\mu\text{g/mL}$)

M_{r1} = molecular weight of aspirin, 180.16

M_{r2} = molecular weight of salicylic acid, 138.12

Calculate the percentage of pentazocine ($C_{19}H_{27}NO$) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance from *Sample solution B*

A_S = absorbance from *Standard solution B*

C_S = concentration of USP Pentazocine RS in *Standard solution B* ($\mu\text{g/mL}$)

C_U = nominal concentration of pentazocine in *Sample solution B* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–110.0% each of the labeled amounts of aspirin ($C_9H_8O_4$) and pentazocine ($C_{19}H_{27}NO$)

PERFORMANCE TESTS

• DISSOLUTION (711)

Medium: Water; 900 mL

Apparatus 1: 80 rpm

Time: 30 min

Standard solution A: 15 $\mu\text{g/mL}$ of USP Salicylic Acid RS in 0.1 N sodium hydroxide

Standard solution B: 13 $\mu\text{g/mL}$ of USP Pentazocine RS in dilute glacial acetic acid (1 in 50)

Strongly basic, anion-exchange resin: Mix a suitable quantity of anion-exchange resin with 10 volumes of dilute glacial acetic acid (1 in 50), and shake for 20 min. Allow the resin to settle, and decant the supernatant. Repeat the acetic acid washing four more times. Wash with water until 5.0 mL of the water wash gives a negligible response when substituted for 5.0 mL of *Sample solution*, and carried through the *Analysis* for pentazocine.

Sample solution: To a suitable 50-mL flask add 0.4 g of *Strongly basic, anion-exchange resin* and 25 mL of the solution under test. Shake by mechanical means for 15 min. Allow to settle, and use the clear supernatant.

Instrumental conditions

Mode: UV-Vis

Analytical wavelength: 296 nm (maximum absorbance) for the analysis of aspirin; 408 nm (maximum absorbance) for the analysis of pentazocine

Cell: 1 cm

Blank: 0.1 N sodium hydroxide for the analysis of aspirin; the chloroform layer from the reagent blank for the analysis of pentazocine

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

For aspirin, transfer 1.0 mL of the *Sample solution* to a 25-mL volumetric flask containing 1.0 mL of sodium hydroxide solution (1 in 10), and swirl. Allow to stand for 10 min. Dilute with water to volume, and mix.

Determine the absorbances of the *Sample solution* and *Standard solution A* against the *Blank* for the analysis of aspirin.

Calculate the percentage of the labeled amount of aspirin ($C_9H_8O_4$) dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times V \times (M_{r1}/M_{r2}) \times 100$$

A_U = absorbance from the *Sample solution*

A_S = absorbance from *Standard solution A*

C_S = concentration of USP Salicylic Acid RS in *Standard solution A* (mg/mL)

L = labeled amount of aspirin (mg/Tablet)

V = volume of *Medium*, 900 mL

M_{r1} = molecular weight of aspirin, 180.16

M_{r2} = molecular weight of salicylic acid, 138.12

For pentazocine, transfer 5.0-mL portions of the *Sample solution*, *Standard solution B*, and water to serve as the reagent blank into three separate 125-mL separators.

To each separator add 10 mL of a filtered solution (1 in 4000) of bromocresol purple in dilute glacial acetic acid (1 in 50) and 20.0 mL of chloroform. Insert the stopper, and shake gently for 1 min, accurately timed. Allow the layers to separate, and determine the absorbances of the clear chloroform layers from *Standard solution B* and the *Sample solution* against the chloroform layer from the reagent blank.

Calculate the percentage of the labeled amount of pentazocine ($C_{19}H_{27}NO$) dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times V \times 100$$

A_U = absorbance from the *Sample solution*

A_S = absorbance from *Standard solution B*

C_S = concentration of USP Pentazocine RS in *Standard solution B* (mg/mL)

L = labeled amount of pentazocine (mg/Tablet)

V = volume of *Medium*, 900 mL

Tolerances: NLT 80% (Q) of the labeled amount of pentazocine ($C_{19}H_{27}NO$) and NLT 70% (Q) of the labeled amount of aspirin ($C_9H_8O_4$) are dissolved.

• **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES

• NONASPIRIN SALICYLATES

Ferric chloride-urea reagent: To a mixture of 8 mL of ferric chloride solution (6 in 10) and 42 mL of 0.05 N hydrochloric acid, add 60 g of urea. Dissolve the urea by swirling and without the aid of heat, and adjust the resulting solution, if necessary, with 6 N hydrochloric acid to a pH of 3.2. Prepare on the day of use.

Standard stock solution: 150 $\mu\text{g/mL}$ of salicylic acid in chloroform

Standard solution: Pipet 5 mL of *Standard stock solution* into a 50-mL volumetric flask containing 10 mL of methanol, 2 drops of hydrochloric acid, and 10 mL of a solution (1 in 10) of glacial acetic acid in ether. Add chloroform to volume, and mix.

Sample solution

Insert a small pledget of glass wool above the stem constriction of a 20- × 2.5-cm chromatographic tube, and uniformly pack with a mixture of about 1 g of chromatographic siliceous earth and 0.5 mL of 5 M

phosphoric acid. Directly above this layer, pack a similar mixture of about 3 g of chromatographic siliceous earth and 2 mL of *Ferric chloride-urea reagent*. To a quantity nominally equivalent to 50 mg of aspirin from finely powdered Tablets add 10 mL of chloroform, stir for 3 min, and transfer to the chromatographic adsorption column with the aid of 5 mL of chloroform. Pass 50 mL of chloroform in several portions through the column, rinse the tip of the chromatographic tube with chloroform, and discard the eluate. If the purple zone reaches the bottom of the tube, discard the column, and repeat the test with a smaller quantity of powdered Tablets.

Elute the adsorbed salicylic acid into a 100-mL volumetric flask containing 20 mL of methanol and 4 drops of hydrochloric acid by passing two 10-mL portions of a solution (1 in 10) of glacial acetic acid in water-saturated ether, and then 30 mL of chloroform, through the column, and dilute the eluate with chloroform to volume.

Instrumental conditions

Mode: UV

Analytical wavelength: 306 nm (maximum absorbance)

Cell: 1 cm

Analysis: Concomitantly determine the absorbances of both the *Sample solution* and *Standard solution*, using a solvent mixture of the same composition as that of the *Standard solution* as the blank.

Acceptance criteria: 3.0%; the absorbance of the *Sample solution* does not exceed that of the *Standard solution*, any necessary adjustment being made for having used a smaller sample.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• **USP REFERENCE STANDARDS (11)**

USP Aspirin RS
USP Pentazocine RS
USP Salicylic Acid RS

Pentazocine and Naloxone Tablets

DEFINITION

Pentazocine and Naloxone Tablets contain amounts of Pentazocine Hydrochloride and Naloxone Hydrochloride equivalent to NLT 90.0% and NMT 110.0% of the labeled amounts of pentazocine ($C_{19}H_{27}NO$) and naloxone ($C_{19}H_{21}NO_4$).

IDENTIFICATION

• **A.**

Diluent: Chloroform and methanol (1:1)

Standard solution A: 5.0 mg/mL of USP Pentazocine RS in *Diluent*

Standard solution B: 1.3 mg/mL of USP Naloxone RS in *Diluent*

Sample solution A: Crush 1 Tablet in 10 mL of *Diluent*. Sonicate for about 2 min, and filter.

Sample solution B: Evaporate 5 mL of *Sample solution A* to dryness on a steam bath under a stream of nitrogen. Dissolve the residue in 0.2 mL of *Diluent*.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 10 μ L, *Standard solution A* and *Sample solution A*; 5 μ L, *Standard solution B* and *Sample solution B*

Developing solvent system: 1-Butanol, water, and glacial acetic acid (70:20:10)

Spray reagent: Folin-Ciocalteu Phenol TS followed by sodium hydroxide solution (1 in 10)

Analysis: Develop the chromatograms in the *Developing solvent system* until the solvent has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and dry under a current of warm air. Spray the plate with *Spray reagent*.

Acceptance criteria: *Sample solution A* and *Sample solution B* exhibit spots having the same R_f values and approximately the same sizes and shapes as their respective *Standard solutions*.

ASSAY

• PROCEDURE

Diluent: Methanol, water, and phosphoric acid (500:500:1)

Solution A: Prepare a filtered and degassed mixture by dissolving 675 mg of sodium 1-octanesulfonate and 426 mg of anhydrous dibasic sodium phosphate in 625 mL of water, and mix.

Mobile phase: Add 475 mL of methanol and 10 mL of phosphoric acid to *Solution A*.

Strong anion-exchange resin: Transfer 30 g of strong anion-exchange resin to a 250-mL beaker. Wash the resin with two 200-mL portions of water, decanting the water after each wash. Wash with two 200-mL portions of dilute glacial acetic acid (1 in 20), decanting the first wash, and filter with the aid of suction.

Standard stock solution: 0.2 mg/mL of USP Naloxone RS in *Diluent*

Standard solution: Transfer 100 mg of USP Pentazocine RS to a 50-mL volumetric flask. Dissolve in about 30 mL of *Diluent*. Add 5.0 mL of the *Standard stock solution*, and dilute with *Diluent* to volume.

Sample solution: Transfer an amount nominally equivalent to 100 mg of pentazocine from NLT 20 Tablets to a 100-mL volumetric flask, and add 50.0 mL of *Diluent*. Sonicate for 5 min, and shake intermittently for 15 min. Filter into a glass-stoppered conical flask. Add about 250 mg of *Strong anion-exchange resin*, and shake for 30 min.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 229 nm

Column: 4.6-mm \times 25-cm; packing L1

Flow rate: 1.5 mL/min

Injection volume: 20 μ L

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for naloxone and pentazocine are about 0.3 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 6 between pentazocine and naloxone

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of pentazocine ($C_{19}H_{27}NO$) and naloxone ($C_{19}H_{21}NO_4$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of pentazocine or naloxone from the *Sample solution*

r_S = peak response of pentazocine or naloxone from the *Standard solution*

C_S = concentration of the appropriate USP Pentazocine RS or USP Naloxone RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of pentazocine or naloxone in the *Sample solution* (mg/mL)
Acceptance criteria: 90.0%–110.0% of the labeled amounts of pentazocine ($C_{19}H_{27}NO$) and naloxone ($C_{19}H_{21}NO_4$)

PERFORMANCE TESTS

• DISSOLUTION (711)

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Time: 45 min

Detector: UV 279 nm (corrected for absorbance at 305 nm)

Standard solution: Dissolve a suitable amount of USP Pentazocine RS in a minimum volume of 0.1 N hydrochloric acid (about 25 mg/mL), diluting quantitatively and stepwise with water.

Sample solution: Filter portions of the solution under test, suitably diluted with *Medium*, if necessary.

Analysis: Determine the labeled amount of pentazocine ($C_{19}H_{27}NO$) dissolved in the *Sample solution* in comparison with the *Standard solution*.

Tolerances: NLT 75% (Q) of the labeled amount of pentazocine ($C_{19}H_{27}NO$) is dissolved.

• UNIFORMITY OF DOSAGE UNITS (905)

Procedure for content uniformity

Diluent: Methanol, water, and phosphoric acid (500:500:1)

Solution A: Prepare a filtered and degassed mixture by dissolving 675 mg of sodium 1-octanesulfonate and 426 mg of anhydrous dibasic sodium phosphate in 625 mL of water, and mix.

Mobile phase: Add 475 mL of methanol and 10 mL of phosphoric acid to *Solution A*.

Strong anion-exchange resin: Transfer 30 g of strong anion-exchange resin to a 250-mL beaker. Wash the resin with two 200-mL portions of water, decanting the water after each wash. Wash with two 200-mL portions of dilute glacial acetic acid (1 in 20), decanting the first wash, and filter with the aid of suction.

Standard stock solution: 0.2 mg/mL of USP Naloxone RS in *Diluent*

Standard solution: Transfer 100 mg of USP Pentazocine RS to a 50-mL volumetric flask. Dissolve in about 30 mL of *Diluent*. Add 5.0 mL of the *Standard stock solution*, and dilute with *Diluent* to volume.

Sample solution: Transfer 1 Tablet to a 25-mL glass-stoppered cylinder. Add 25.0 mL of *Diluent*. Sonicate for 10 min, and shake intermittently for 15 min. Filter into a glass-stoppered conical flask. Add about 125 mg of *Strong anion-exchange resin*, and shake for 30 min.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 229 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1.5 mL/min

Injection volume: 20 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for naloxone and pentazocine are about 0.3 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 6 between pentazocine and naloxone

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of pentazocine ($C_{19}H_{27}NO$) and naloxone ($C_{19}H_{21}NO_4$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of pentazocine or naloxone from the *Sample solution*

r_S = peak response of pentazocine or naloxone from the *Standard solution*

C_S = concentration of the appropriate USP Pentazocine RS or USP Naloxone RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of pentazocine or naloxone in the *Sample solution* (mg/mL)

Acceptance criteria: Meet the requirements

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• USP REFERENCE STANDARDS (11)

USP Naloxone RS

USP Pentazocine RS

Pentazocine Injection

DEFINITION

Pentazocine Injection is a sterile solution of Pentazocine in Water for Injection, prepared with the aid of Lactic Acid. It contains NLT 95.0% and NMT 105.0% of the labeled amount of pentazocine ($C_{19}H_{27}NO$).

IDENTIFICATION

• A.

Sample solution: Transfer a volume of Injection, equivalent to about 15 mg of lactic acid, to a 50-mL conical flask, add 1 mL of 2 N sulfuric acid, and mix. Add, dropwise, potassium permanganate solution (3.2 in 100) until a slight excess has been added, as evidenced by a violet color. [NOTE—The addition of a large excess of potassium permanganate may result in a false-negative test for lactate.]

Analysis: Moisten a piece of filter paper with a color-indicating solution (previously prepared by dissolving 250 mg of sodium nitroferrocyanide in water to make 9 mL of solution, adding 1 mL of morpholine, and mixing). Place the moistened filter paper over the conical flask opening, and heat the solution moderately.

Acceptance criteria: The acetaldehyde fumes produced turn the moistened filter paper blue.

• B. IDENTIFICATION—ORGANIC NITROGENOUS BASES (181)

Standard solution: Dissolve 50 mg of USP Pentazocine RS in 25 mL of 0.01 N hydrochloric acid in a separator, and use this in place of the *Standard solution* specified in the chapter.

Sample solution: A volume of Injection equivalent to 50 mg of pentazocine

Acceptance criteria: Meets the requirements

ASSAY

• PROCEDURE

Diluent: Methanol and 6 N hydrochloric acid (500:500)

Column (ion-exchange): Place a pledget of glass wool in the base of a 6-mm (ID) tube equipped with a stopcock, and fill the tube to a height of about 25 mm with a styrene-divinylbenzene cation-exchange resin that has been previously soaked in 3 N hydrochloric acid for NLT 2 h. Pass 10 mL of methanol through the column, followed by 50 mL of 3 N hydrochloric acid, then wash the column with water until the eluate is neutral. [CAUTION—Do not permit the column to become dry at any time.]

Standard stock solution: 1.2 mg/mL of USP Pentazocine RS in *Diluent*

Standard solution: 0.12 mg/mL of USP Pentazocine RS in *Diluent* from *Standard stock solution*

Sample stock solution: Nominally equivalent to 6 mg/mL of pentazocine in water, diluted from an accurately measured volume of Injection.

Sample solution: Transfer 2.0 mL of *Sample stock solution* to the *Column*, then pass 100 mL of water through the *Column* at a rate of 2 mL/min, and discard the eluate. Place a 100-mL volumetric flask under the *Column*, and pass *Diluent* through the *Column* until approximately 95 mL of eluate has been collected. Remove the flask, and dilute with *Diluent* to volume.

Instrumental conditions

Mode: UV

Analytical wavelength: 278 nm

Cell: 1 cm

Blank: *Diluent*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of pentazocine ($C_{19}H_{27}NO$) in the portion of the Injection taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Pentazocine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of pentazocine in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

SPECIFIC TESTS

- **BACTERIAL ENDOTOXINS TEST (85):** NMT 5.8 USP Endotoxin Units/mg of pentazocine
- **PH (791):** 4.0–5.0
- **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* (1).

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose or multiple-dose containers, preferably of Type I glass.
- **USP REFERENCE STANDARDS (11)**
USP Endotoxin RS
USP Pentazocine RS

Pentetic Acid

$C_{14}H_{23}N_3O_{10}$ 393.35

Glycine, *N,N*-bis[2-[bis(carboxymethyl)amino]ethyl].

Diethylenetriaminepentaacetic acid [67-43-6].

» Pentetic Acid contains not less than 98.0 percent and not more than 100.5 percent of $C_{14}H_{23}N_3O_{10}$.

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Pentetic Acid RS

Identification, Infrared Absorption (197K).

Residue on ignition (281): not more than 0.2%.

Delete the following:

• **Heavy metals, Method II (231):** 0.005%. • (Official 1-Jan-2018)

Limit of nitrilotriacetic acid—

Cupric acetate solution—Dissolve 20 g of cupric acetate in a mixture of 800 mL of water and 10 mL of glacial acetic acid. Adjust with 1 N sodium hydroxide to a pH of 4.2, dilute with water to obtain 1000 mL of solution, and filter.

Mobile phase—Prepare a mixture of 1600 mL of water, 40 mL of glacial acetic acid, 30.4 mL of 0.5 M dodecyltriethylammonium phosphate, and 20 mL of *Cupric acetate solution*. Adjust with 1 N sodium hydroxide to a pH of 4.0, dilute with water to obtain 2000 mL of solution, filter through a filter having a 0.5-μm or finer porosity, and degas. Make adjustments if necessary (see *System Suitability under Chromatography* (621)).

Stock standard solution—Transfer about 50 mg of nitrilotriacetic acid, accurately weighed, to a 100-mL volumetric flask, dilute with *Cupric acetate solution* to volume, and mix.

Standard solution—Transfer 1.0 mL of the *Stock standard solution* to a 25-mL volumetric flask, dilute with *Cupric acetate solution* to volume, and mix. This solution contains about 0.02 mg of nitrilotriacetic acid per mL.

Test solution—Transfer about 2 g of Pentetic Acid, accurately weighed, to a 100-mL volumetric flask. Add about 70 mL of *Cupric acetate solution*, and swirl to dissolve. Sonicate, if necessary, to dissolve. Dilute with *Cupric acetate solution* to volume, and mix.

Resolution solution—Transfer 1.0 mL of the *Stock standard solution* to a 25-mL volumetric flask, dilute with *Test solution* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 290-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L1 that has been highly deactivated (carbon loading of about 30%). The flow rate is about 1 mL per minute. Equilibrate the column by passing, in sequence, water, methanol, and water for about 15 minutes each, and then *Mobile phase* for about 45 minutes. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution, R , between pentetic acid and nitrilotriacetic acid is not less than 2.0, and the relative retention times are about 0.6 for pentetic acid and 1.0 for nitrilotriacetic acid. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 20 μL) of the *Standard solution* and the *Test solution* into the chromatograph, and measure the responses for the major peaks. Calculate the percentage of nitrilotriacetic acid in the portion of Pentetic Acid taken by the formula:

$$10,000(C/W)(r_U/r_S)$$

of which C is the concentration, in mg per mL, of nitrilotriacetic acid in the *Standard solution*, W is the weight, in mg, of Pentetic Acid taken to prepare the *Test solution*, and r_U and r_S are the nitrilotriacetic acid peak responses obtained from the *Test solution* and the *Standard solution*, respectively. The limit is 0.1%.

Iron—Using 1.5 g of specimen, proceed as directed in the test for *Iron* under *Edetic Acid*. The color of the test solution is not deeper than that of the solution containing the standard iron solution (0.01%).

Assay—Transfer about 200 mg of Pentetic Acid, accurately weighed, to a 125-mL conical flask, add 50 mL of water and 1.5 mL of 1 N sodium hydroxide, and swirl to dissolve the

specimen. Add 10 mL of 0.1 N ammonium thiocyanate, and mix. Add about 40 mL of methyl ethyl ketone, mix, and allow the layers to separate. Titrate with 0.05 N ferric ammonium sulfate VS, stirring continuously. As the titration proceeds, the aqueous phase turns from colorless to yellow, and the organic phase remains colorless. As the endpoint is approached, stop the titration, mix, and allow the layers to separate. Add 0.1-mL increments of 0.05 N ferric ammonium sulfate VS, mixing and allowing the layers to separate after each addition, until the organic layer turns from colorless to pink. Each mL of 0.05 N ferric ammonium sulfate consumed is equivalent to 19.668 mg of $C_{14}H_{23}N_3O_{10}$.

Pentobarbital

$C_{11}H_{18}N_2O_3$ 226.27
2,4,6-(1H,3H,5H)-Pyrimidinetrione, 5-ethyl-5-(1-methylbutyl)-, (±)-;
(±)-5-Ethyl-5-(1-methylbutyl)barbituric acid [76-74-4].

DEFINITION

Pentobarbital contains NLT 98.0% and NMT 102.0% of $C_{11}H_{18}N_2O_3$, calculated on the dried basis. Where the material is labeled as intended solely for veterinary use, Pentobarbital contains NLT 97.0% and NMT 102.0% of $C_{11}H_{18}N_2O_3$, calculated on the dried basis.

• **Heavy metals, Method II** (231): 0.003%. • (Official 1-Jan-2018)

Related compounds—

Mobile phase—Prepare as directed in the *Assay*.

Standard solution—Dissolve an accurately weighed quantity of USP Pentobarbital RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.001 mg per mL.

Test solution—Transfer about 110 mg of Pentobarbital Sodium, accurately weighed, to a 100-mL volumetric flask, add about 80 mL of *Mobile phase*, and sonicate until dissolved. Dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the capacity factor, k' , is not less than 2.5; the column efficiency is not less than 15,000 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 15.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of any impurity in the portion of Pentobarbital Sodium taken by the formula:

$$(248.25/226.27)(10,000/F)(C/W)(r_i/r_s)$$

in which 248.25 and 226.27 are the molecular weights of pentobarbital sodium and pentobarbital, respectively; F is the relative response factor of the impurity according to the table below; C is the concentration, in mg per mL, of USP Pentobarbital RS in the *Standard solution*; W is the weight, in mg, of Pentobarbital Sodium, on the dried basis, used to prepare the *Test solution*; r_i is the peak area for any impurity in the *Test solution*; and r_s is the peak area for pentobarbital in the *Standard solution*: the impurities meet the requirements given in the table below:

Compound Name	Relative Retention Time	Relative Response Factor	Limit (%)
6-Imino-5-ethyl-5-(1-methylbutyl)barbituric acid	about 0.39	1.5	0.2
5-Ethyl-5-(1-ethylpropyl)barbituric acid*	about 0.93	1.0	0.1
Pentobarbital	1.0	—	—
5-Ethyl-5-(1,3-dimethylbutyl)barbituric acid	about 1.5	0.9	0.3
Unknown impurities	—	1.0	0.1
Total	—	—	0.5

* Where the material is labeled as intended solely for veterinary use, the limit of 5-ethyl-5-(1-ethylpropyl) barbituric acid is 3.0%.

Assay—[NOTE—Use the value for *Loss on drying* obtained at the same time as the preparation of the *Test solution* in the test for *Related compounds* and the *Assay preparation* in the *Assay*.]

Mobile phase, *Standard preparation*, and *Chromatographic system*—Proceed as described in the *Assay* under *Pentobarbital*.

Assay preparation—Transfer about 110 mg of Pentobarbital Sodium, accurately weighed, to a 100-mL volumetric flask, add about 80 mL of *Mobile phase*, and sonicate until dissolved. Dilute with *Mobile phase* to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix.

Procedure—Separately inject equal volumes (about 10 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{11}H_{17}N_2NaO_3$ in the portion of Pentobarbital Sodium taken by the formula:

$$(248.25/226.27)1000C(r_u / r_s)$$

in which 248.25 and 226.27 are the molecular weights of pentobarbital sodium and pentobarbital, respectively; C is the concentration, in mg per mL, of USP Pentobarbital RS in the *Standard preparation*; and r_u and r_s are the peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Pentobarbital Sodium Injection

» Pentobarbital Sodium Injection is a sterile solution of Pentobarbital Sodium in a suitable solvent. Pentobarbital may be substituted for the equivalent amount of Pentobarbital Sodium, for adjustment of the pH. The Injection contains the equivalent of not less than 92.0 percent and not more than 108.0 percent of the labeled amount of $C_{11}H_{17}N_2NaO_3$.

Packaging and storage—Preserve in single-dose or multiple-dose containers, preferably of Type I glass. The Injection may be packaged in 50-mL containers.

Labeling—The label indicates that the Injection is not to be used if it contains a precipitate.

USP Reference standards (11)—

USP Endotoxin RS
USP Pentobarbital RS

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the Assay.

Bacterial Endotoxins Test (85)—It contains not more than 0.8 USP Endotoxin Unit per mg of pentobarbital sodium.

pH (791): between 9.0 and 10.5.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—

Mobile phase—Prepare a filtered and degassed pH 3.5 mixture of 0.01 M monobasic potassium phosphate and acetonitrile (65:35). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Dissolve an accurately weighed quantity of USP Pentobarbital RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg per mL.

Assay preparation—Quantitatively dilute a suitable volume of Injection with *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg per mL.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 214-nm detector, and a 4.6-mm \times 25-cm column that contains 5- μ m packing

L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the capacity factor, k' , is not less than 2.5; the column efficiency is not less than 15,000 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $C_{11}H_{17}N_2NaO_3$ in the portion of Injection taken by the formula:

$$100(248.25/226.27)(C_s / C_u)(r_u / r_s)$$

in which 248.25 and 226.27 are the molecular weights of pentobarbital sodium and pentobarbital, respectively; C_s is the concentration, in mg per mL, of USP Pentobarbital RS in the *Standard preparation*; C_u is the final concentration, in mg per mL, of the *Assay preparation*; and r_u and r_s are the peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Pentoxifylline

$C_{13}H_{18}N_4O_3$ 278.31
1*H*-Purine-2,6-dione, 3,7-dihydro-3,7-dimethyl-1-(5-oxohexyl)-;
1-(5-Oxohexyl)theobromine [6493-05-6].

DEFINITION

Pentoxifylline contains NLT 98.0% and NMT 102.0% of pentoxifylline ($C_{13}H_{18}N_4O_3$).

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

• PROCEDURE

Solution A: 1 g/L of perchloric acid

Mobile phase: Methanol, tetrahydrofuran, acetonitrile, and *Solution A* (2: 2.5: 15: 80)

System suitability solution: 0.024 mg/mL of caffeine and 0.048 mg/mL of USP Pentoxifylline RS in *Mobile phase*

Standard solution: 0.05 mg/mL of USP Pentoxifylline RS in *Mobile phase*

Sample solution: 0.05 mg/mL of Pentoxifylline in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 273 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Flow rate: 0.7 mL/min

Injection volume: 10 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 10.0 between caffeine and pentoxifylline, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of pentoxifylline ($C_{13}H_{18}N_4O_3$) in the portion of Pentoxifylline taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response from the *Sample solution*
 r_S = peak response from the *Standard solution*
 C_S = concentration of USP Pentoxifylline RS in the *Standard solution* (mg/mL)
 C_U = concentration of Pentoxifylline in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0%

IMPURITIES

• **RESIDUE ON IGNITION** (281): NMT 0.1%

• **CHLORIDE AND SULFATE, Chloride** (221)

Sample: 2.0 g

Acceptance criteria: The *Sample* shows no more chloride than corresponds to 0.31 mL of 0.020 N hydrochloric acid (0.011%).

• **CHLORIDE AND SULFATE, Sulfate** (221)

Sample: 1.0 g

Acceptance criteria: The *Sample* shows no more sulfate than corresponds to 0.20 mL of 0.020 N sulfuric acid (0.02%).

Delete the following:

• **HEAVY METALS, Method II** (231): NMT 10 ppm (Official 1, Jan-2018)

• **ORGANIC IMPURITIES**

Solution A and Mobile phase: Prepare as directed in the Assay.

System suitability solution: 0.7 µg/mL of caffeine and 350 µg/mL of USP Pentoxifylline RS in *Mobile phase*

Standard solution: 0.7 µg/mL of USP Pentoxifylline RS in *Mobile phase*

Sample solution: 350 µg/mL of Pentoxifylline in *Mobile phase*

Chromatographic system: Proceed as directed in the Assay except for the following:

Injection volume: 20 µL

Run time: NLT 5 times the retention time for pentoxifylline

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 10.0 between caffeine and pentoxifylline, *System suitability solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Measure the areas of all the peaks in the *Sample solution*, except for that of pentoxifylline.

Calculate the percentage of each impurity in the portion of Pentoxifylline taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response of each impurity from the *Sample solution*
 r_S = peak response of pentoxifylline from the *Standard solution*
 C_S = concentration of USP Pentoxifylline RS in the *Standard solution* (µg/mL)
 C_U = concentration of Pentoxifylline in the *Sample solution* (µg/mL)

Acceptance criteria

Individual impurities: NMT 0.2%

Total impurities: NMT 0.5%

SPECIFIC TESTS

• **COMPLETENESS OF SOLUTION** (641)

Sample solution: 1 g in 50 mL of carbon dioxide-free water

Acceptance criteria: Meets the requirements

• **ACIDITY**

Sample solution: 1 g in 50 mL of carbon dioxide-free water

Analysis: To the *Sample solution* add 1 drop of bromothymol blue TS.

Acceptance criteria: NMT 0.2 mL of 0.01 N sodium hydroxide is required to produce a color change.

• **LOSS ON DRYING** (731)

Analysis: Dry under vacuum at 60° for 3 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **USP REFERENCE STANDARDS** (11)

USP Pentoxifylline RS

Pentoxifylline Compounded Oral Suspension

DEFINITION

Pentoxifylline Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of pentoxifylline ($C_{13}H_{18}N_4O_3$).

Prepare Pentoxifylline Compounded Oral Suspension 20 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Pentoxifylline extended-release tablets* equivalent to	2 g of pentoxifylline
Purified Water, USP, a sufficient quantity to make	100 mL

*Trental 400-mg tablets, sanofi-aventis, Somerville, NJ.

Calculate the required quantity of each ingredient for the total amount to be prepared. Place the required number of *Pentoxifylline extended-release tablets* in a suitable mortar, add *Purified Water* in small portions, and triturate to make a smooth paste. Add increasing volumes of *Purified Water* to make a pentoxifylline liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough *Purified Water* to bring to final volume, and mix well.

ASSAY

• **PROCEDURE**

Solution A: 50 mM monobasic potassium phosphate buffer, adjusted with phosphoric acid to a pH of 3.2

Mobile phase: Acetonitrile and *Solution A* (20:80). Pass through a filter of 0.45-µm pore size, and degas.

Internal standard solution: 100 µg/mL of caffeine in *Mobile phase*

Standard stock solution: 20 mg/mL of USP Pentoxifylline RS in *Mobile phase*

Standard solution: Pipet 1.0 mL of *Standard stock solution* into a 15-mL conical centrifuge tube, and add 9 mL of deionized water. Mix the sample for 30 s in a vortex mixer, and centrifuge for 30 min at 1250 × g. Pipet 50 µL of the supernatant into a separate borosilicate culture tube, dilute with 575 µL of *Mobile phase*, and add 625 µL of *Internal standard solution* to obtain a so-

lution having a nominal concentration of 80 µg/mL of pentoxifylline and 50 µg/mL of caffeine.

Sample solution: Shake thoroughly by hand each bottle of Oral Suspension. Pipet 1.0 mL of Oral Suspension into a 15-mL conical centrifuge tube, and add 9 mL of deionized water. Mix the sample for 30 s in a vortex mixer, and centrifuge for 30 min at 1250 × g. Pipet 50 µL of the supernatant into a separate borosilicate culture tube, dilute with 575 µL of *Mobile phase*, and add 625 µL of *Internal standard solution* to obtain a solution having a nominal concentration of 80 µg/mL of pentoxifylline and 50 µg/mL of caffeine.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Flow rate: 1.0 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for caffeine and pentoxifylline are about 0.42 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 10.0 between pentoxifylline and caffeine

Column efficiency: NLT 10,000 theoretical plates

Tailing factor: NMT 2.0 for the pentoxifylline peak

Relative standard deviation: NMT 2.0% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of pentoxifylline ($C_{13}H_{18}N_4O_3$) in the portion of Oral Suspension taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of pentoxifylline to the internal standard from the *Sample solution*

R_S = peak response ratio of pentoxifylline to the internal standard from the *Standard solution*

C_S = concentration of USP Pentoxifylline RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of pentoxifylline in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

• **PH (791):** 5.9–7.7

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store in a refrigerator or at controlled room temperature.
- **BEYOND-USE DATE:** NMT 90 days after the date on which it was compounded, when stored in a refrigerator or at controlled room temperature
- **LABELING:** Label it to indicate that it is to be well shaken before use, and to state the *Beyond-Use Date*.
- **USP REFERENCE STANDARDS (11)**
USP Pentoxifylline RS

Pentoxifylline Extended-Release Tablets

» Pentoxifylline Extended-Release Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of pentoxifylline ($C_{13}H_{18}N_4O_3$).

Packaging and storage—Preserve in well-closed containers. Protect from light, and store between 15° and 30°.

Labeling—The labeling indicates the *Dissolution Test* with which the product complies.

USP Reference standards (11)—

USP Pentoxifylline RS

Identification—

A: Infrared Absorption (197K)—

Test specimen—Finely powder not fewer than 5 Tablets. (A coarse screen may be used to separate the powder from the tablet film-coating if necessary.) Transfer an accurately weighed portion of the powder, equivalent to about 200 mg of pentoxifylline, to a 15-mL centrifuge tube, add about 10 mL of methanol, cap the tube, and shake vigorously for about 5 minutes. Centrifuge for about 5 minutes to allow undissolved material to settle. Decant the supernatant into a suitable beaker, and evaporate the solution with the aid of a current of air to dryness at about 35°. Dissolve the residue in about 15 mL of methylene chloride, transfer to a separatory funnel, add about 10 mL of water, and shake. Allow the layers to separate, transfer the methylene chloride layer, and pass through a funnel partially filled with anhydrous sodium sulfate, collecting the filtrate in a small beaker. Evaporate the solution with the aid of a current of air to dryness at about 35°. Dissolve the residue so obtained in 8 to 10 mL of ether, and then chill in an ice bath, if necessary, to induce crystallization. Collect the crystals on filter paper, wash with about 2 mL of cold ether, and allow to air-dry. Prepare a mixture of about 1.5% (w/w) of the crystals in potassium bromide.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Dissolution (711)—

TEST 1—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 1*.

Medium: water; 900 mL or 1000 mL.

Apparatus 2: 100 rpm.

Times: 1, 4, 8, and 12 hours.

Procedure—Determine the amount of $C_{13}H_{18}N_4O_3$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 274 nm on filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a *Standard solution* having a known concentration of USP Pentoxifylline RS in the same *Medium*.

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}N_4O_3$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	not more than 30%
4	between 30% and 55%
8	not less than 60%
12	not less than 80%

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: water; 900 mL.

Apparatus 2: 75 rpm.

Times: 1, 6, 10, and 20 hours.

Procedure—Proceed as directed for *Test 1*.

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}N_4O_3$ dissolved at the times specified conform to the following table.

Time (hours)	Amount dissolved
1	between 8% and 30%
6	between 35% and 60%
10	between 53% and 78%
20	not less than 80%

TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Medium: water; 900 mL.

Apparatus 1: 100 rpm.

Times: 2, 8, 12, and 20 hours.

Procedure—Proceed as directed for *Test 1*.

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}N_4O_3$ dissolved at the times specified conform to the following table.

Time (hours)	Amount dissolved
2	between 15% and 35%
8	between 55% and 75%
12	between 75% and 95%
20	not less than 85%

TEST 4—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Times: 1, 8, and 24 hours.

Procedure—Proceed as directed for *Test 1*.

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}N_4O_3$ dissolved at the times specified conform to the following table.

Time (hours)	Amount dissolved
1	between 0% and 20%
8	between 35% and 60%
24	not less than 80%

TEST 5—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 5*.

Medium: water; 900 mL.

Apparatus 2: 75 rpm.

Times: 1, 2, 4, 6, and 20 hours.

Procedure—Proceed as directed for *Test 1*, except to use the wavelength of maximum absorbance at about 264 nm instead of 274 nm.

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}N_4O_3$ dissolved at the times specified conform to the following table.

Time (hours)	Amount dissolved
1	between 5% and 25%
2	between 10% and 35%
4	between 20% and 50%
6	between 30% and 60%
20	not less than 80%

TEST 6—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 6*.

Medium: simulated gastric fluid (without enzymes); 900 mL.

Apparatus 2: 50 rpm.

Times: 2, 8, 12, and 24 hours.

Procedure—Proceed as directed for *Test 1*.

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}N_4O_3$ dissolved at the times specified conform to the following table.

Time (hours)	Amount dissolved
2	between 10% and 30%
8	between 40% and 60%
12	between 55% and 75%
24	not less than 85%

TEST 7—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 7*.

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Times: 1, 3, 8, and 18 hours.

Procedure—Proceed as directed for *Test 1*.

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}N_4O_3$ dissolved at the times specified conform to the following table.

Time (hours)	Amount dissolved
1	not more than 25%
3	between 25% and 45%
8	between 55% and 75%
18	not less than 80%

TEST 8—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 8*.

Medium: water; 900 mL.

Apparatus 2: 75 rpm.

Times: 1, 2, 4, 10, and 16 hours.

Procedure—Proceed as directed for *Test 1*.

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}N_4O_3$ dissolved at the times specified conform to the following table.

Time (hours)	Amount dissolved
1	between 10% and 20%
2	between 15% and 35%
4	between 25% and 45%
10	between 55% and 75%
16	not less than 80%

TEST 9—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 9*.

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Times: 1, 3, 6, 12, and 18 hours.

Procedure—Proceed as directed for *Test 1*, except to use the wavelength of maximum absorbance at about 230 nm instead of 274 nm.

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}N_4O_3$ dissolved at the times specified conform to the following table.

Time (hours)	Amount dissolved
1	between 0% and 20%
3	between 20% and 40%
6	between 30% and 60%
12	between 50% and 80%
18	not less than 80%

TEST 10—If the product complies with this test, the labeling indicates that it meets USP Dissolution Test 10.

Medium: water; 900 mL.

Apparatus 2: 75 rpm.

Times: 1, 6, 12, and 20 hours.

Procedure—Proceed as directed for Test 1.

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}N_4O_3$ dissolved at the times specified conform to the following table.

Time (hours)	Amount dissolved
1	not more than 20%
6	between 35% and 65%
12	between 60% and 90%
20	not less than 80%

Uniformity of dosage units (905): meet the requirements.

Chromatographic purity—

Perchloric acid solution, Mobile phase, Extracting solution, and System suitability solution—Prepare as directed in the Assay.

Standard solution—Dissolve an accurately weighed quantity of USP Pentoxifylline RS in Extracting solution containing an amount of methanol equal to 0.8% of the total volume to be used, and dilute quantitatively, and stepwise if necessary, with Extracting solution to obtain a solution having a known concentration of about 0.96 µg per mL.

Test solution—Transfer 10.0 mL of the first dilution filtrate from the Assay preparation to a 25-mL volumetric flask, dilute with Extracting solution to volume, and mix. The final concentration of pentoxifylline in this solution is about 0.32 mg per mL.

Chromatographic system (see Chromatography (621))—Proceed as directed in the Assay. Chromatograph the Standard solution, and record the peak responses for pentoxifylline as directed for Procedure: the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the Standard solution and the Test solution into the chromatograph, and allow the chromatogram to run five times longer than the retention time of the pentoxifylline peak. Record the chromatograms, and measure all the peak responses from the Test solution, except that for pentoxifylline. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$312C(r_i / r_s)$$

in which C is the concentration, in mg per mL, of USP Pentoxifylline RS in the Standard solution; r_i is the peak response for each impurity obtained from the Test solution; and r_s is the peak response for pentoxifylline obtained from the Standard solution: not more than 0.3% of any individual impurity is found; and not more than 1.0% of total impurities is found.

Assay—

Perchloric acid solution—Dissolve 1.0 g of perchloric acid in 1000 mL of water, and mix.

Mobile phase—Prepare a filtered and degassed mixture of Perchloric acid solution, acetonitrile, tetrahydrofuran, and methanol (80:15:2.5:2). Make adjustments if necessary (see System Suitability under Chromatography (621)).

Extracting solution—Prepare a mixture of water and alcohol (7:3).

System suitability solution—Transfer about 20 mg of USP Pentoxifylline RS and about 10 mg of caffeine, each accurately weighed, to a 25-mL volumetric flask. Add 0.2 mL of methanol, and swirl the flask to distribute the methanol.

Dilute with Extracting solution to volume, and mix. Pipet 3.0 mL of the resulting solution into a 50-mL volumetric flask, dilute with Extracting solution to volume, and mix.

Standard preparation—Dissolve an accurately weighed quantity of USP Pentoxifylline RS in Extracting solution containing an amount of methanol equal to 0.8% of the total volume to be used, and dilute quantitatively, and stepwise if necessary, with Extracting solution to obtain a solution having a known concentration of about 0.048 mg per mL.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 40 mg of pentoxifylline, to a 50-mL volumetric flask. Pipet 0.4 mL of methanol into the flask, and swirl for at least 1 minute. Add about 30 mL of Extracting solution, and sonicate for 60 minutes with occasional swirling of the flask. Add an additional 15 mL of Extracting solution, allow to cool to room temperature, dilute with Extracting solution to volume, and mix. Centrifuge or pass through a suitable filter. Reserve a portion of this first dilution for preparation of the Test solution in the Chromatographic purity test. Pipet 3.0 mL of the clear solution into a 50-mL volumetric flask, dilute with Extracting solution to volume, and mix.

Chromatographic system (see Chromatography (621))—The liquid chromatograph is equipped with a 273-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 0.7 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the resolution, R , between caffeine and pentoxifylline is not less than 10.0. Chromatograph the Standard preparation, and record the peak responses for pentoxifylline as directed for Procedure: the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of pentoxifylline ($C_{13}H_{18}N_4O_3$) in the portion of Tablets taken by the formula:

$$833C(r_u / r_s)$$

in which C is the concentration, in mg per mL, of USP Pentoxifylline RS in the Standard preparation; and r_u and r_s are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.

Peppermint Spirit

DEFINITION

Peppermint Spirit contains, in each 100 mL, NLT 9.0 mL and NMT 11.0 mL of peppermint oil.

Peppermint Oil	100 mL
Peppermint, in coarse powder	10 g
Alcohol, a sufficient quantity to make	1000 mL

Macerate the peppermint leaves, freed as much as possible from stems and coarsely powdered, for 1 h in 500 mL of purified water, and then strongly express them. Add the moist, macerated leaves to 900 mL of alcohol, and allow the mixture to stand for 6 h with frequent agitation. Filter, and to the filtrate add the oil, and add alcohol to make the product measure 1000 mL.

ASSAY

• CONTENT OF PEPPERMINT OIL

Sample: 5.0 mL of Spirit

Analysis: Transfer the Sample to a Babcock bottle, graduated to 8%. Add 1.0 mL of kerosene, and mix. Add a

saturated calcium chloride solution, acidified with hydrochloric acid, almost to fill the bulb of the bottle. Rotate the bottle vigorously to ensure mixing, and then add a sufficient quantity of the calcium chloride solution to bring the separated oil into the neck of the bottle. Centrifuge at about 1500 rpm for 5 min, and read the volume of oil in the stem. Subtract five divisions for the kerosene added, and multiply the remaining number of divisions by 4.2 to obtain the volume, in mL, of peppermint oil in 100 mL of the Spirit.

Acceptance criteria: 9.0–11.0 mL

SPECIFIC TESTS

- **ALCOHOL DETERMINATION, Method II (611):** 79.0%–85.0% of C_2H_5OH

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light.

Perflubron

C_8BrF_{17} 498.96

Octane, 1-bromo-1,1,2,2,3,3,4,4,5,5,6,6,7,7,8,8-heptafluoro-

1-Bromoheptafluorooctane.

Perfluorooctyl bromide [423-55-2].

» Perflubron contains not less than 98.0 and not more than 100.0 percent of C_8BrF_{17} .

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Perflubron RS

Identification—

A: Record the IR absorption spectrum, using a gas cell. The spectrum so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Perflubron RS.

B: The retention time of the major peak in the chromatogram of the test specimen, obtained as directed in the Assay, corresponds to that of USP Perflubron RS, similarly chromatographed.

Specific gravity (841): between 1.922 and 1.925.

Chromatographic purity—

Chromatographic system (see *Chromatography* (621))—The gas chromatograph is equipped with a split injection port with a split ratio, range of 1:45 to 1:100, a flame-ionization detector, and a 0.25-mm × 60-m column coated with a 1-μm film of phase G2. Hydrogen is used as the carrier gas. The chromatograph is programmed to maintain the column temperature at 35° for 7 minutes, then to increase the temperature at a rate of 20° per minute to 185°, and held at this temperature for 4.5 minutes. The injection port is maintained between 200° and 220° and the detector at a temperature above 200°.

Procedure—Inject a volume (about 0.2 μL) of Perflubron into the chromatograph, record the chromatogram, and measure the areas of the peak responses. Calculate the per-

centage of each individual impurity in the portion of Perflubron taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response of the individual impurity, and r_s is the sum of the responses of all the peaks: not more than 0.20% of any individual impurity is found.

Nonvolatile residue—Transfer 75 g of Perflubron to a tared evaporating dish, evaporate to dryness, and dry the residue at 105° for 1 hour: the weight of the residue so obtained does not exceed 1.5 mg (0.002%).

Assay—

Chromatographic system—Proceed as directed in the test for *Chromatographic purity*.

Procedure—Inject about 0.2 μL of Perflubron into the chromatograph, record the chromatograms, and measure the areas of the peak responses. Calculate the percentage of C_8BrF_{17} in the portion of Perflubron taken by the formula:

$$100(r_U / r_s)$$

in which r_U is the peak response for perflubron obtained from the test specimen, and r_s is the sum of the responses of all of the peaks.

Perflutren Protein-Type A Microspheres Injectable Suspension

» Perflutren Protein-Type A Microspheres Injectable Suspension is a sterile, nonpyrogenic suspension of microspheres produced by dispersing perflutren (octafluoropropane) gas in an aqueous solution of diluted sterile Albumin Human. It contains not less than 0.8 percent and not more than 1.2 percent protein. It may contain stabilizers, but contains no preservatives.

Packaging and storage—Preserve in single-dose, tight containers that contain perflutren gas in the headspace, and store in a refrigerator.

Labeling—Label it to indicate that perflutren gas is contained within the microspheres. The labeling also provides the following warnings: "Do not use if lower layer is cloudy or turbid, contains visible foreign matter, or if the contents do not appear as a homogeneous, opaque, milky-white suspension after mixing. Do not use if the upper white layer of product is absent. Do not inject air into the vial. Invert the vial, and gently rotate to resuspend the microspheres. Do not use if, after resuspension, the solution appears to be clear rather than opaque milky-white."

USP Reference standards (11)—
USP Endotoxin RS

Bacterial Endotoxins Test (85)—It contains not more than 0.5 USP Endotoxin Unit per mL of Perflutren Protein-Type A Microspheres Injectable Suspension.

Safety—It meets the requirements for biologics as set forth for *Safety Tests—Biologicals* under *Biological Reactivity Tests, In Vivo* (88).

Sterility Tests (71): meets the requirements.

pH (791): between 6.4 and 7.4.

Microsphere size and concentration—

Electrolyte solution—Use filtered and buffered saline electrolyte solution.¹

¹ Filtered and buffered saline electrolyte solution is available as ISOTON(®) II from Beckman Coulter, Inc., Fullerton, CA.

Diluent—Prepare a solution that contains, in each L of water, 1.5 g of sodium lauryl sulfate and 0.1 g of thimerosal. Prior to use, pass the solution through a 0.2- μ m nylon filter. [NOTE—The *Diluent* is to be used exclusively to prepare the *Reference stock solution* described below; it must not be used to prepare the *Test solution*.]

Reference stock solution—Transfer a quantity of NIST traceable microspheres suspension containing about 0.5 g of microspheres directly into a tared centrifuge tube equipped with a cap, and weigh.² Using the density and concentration of the microspheres obtained from the Certificate of Analysis, calculate the volume occupied by the microspheres and the number of microspheres in the portion taken. Calculate the target total volume, in mL, by dividing the number of microspheres in the portion taken by the target concentration of 2.0×10^8 microspheres per mL. Calculate the target *Diluent* volume by subtracting the volume occupied by the microspheres from the target total volume. Transfer the target volume of *Diluent* to the centrifuge tube containing the portion of microspheres taken, and mix the tube vigorously for 1 hour. The prepared *Reference stock solution*, which contains a suspension of microspheres with a target mean particle diameter of 5.2 μ m and a concentration of 2.0×10^8 microspheres per mL, is divided into smaller containers and stored at 5°.

Reference solution—Equilibrate the *Reference stock solution* to room temperature, and mix thoroughly. Immediately transfer 20 μ L of the *Reference stock solution* to a beaker containing 200 mL of *Electrolyte solution*, mix, and analyze immediately.

Blank solution—Use 200 mL of *Electrolyte solution*.

Test solution—Allow the Injectable Suspension to equilibrate to room temperature. Invert the vial, and gently rotate to resuspend the microspheres. [NOTE—After resuspension, the contents should appear as a homogeneous, opaque, milky-white suspension.] Immediately withdraw a 20- μ L aliquot, transfer to a beaker containing 200 mL of *Electrolyte solution*, mix, and analyze immediately.

Test apparatus—Use a multichannel particle analyzer that operates on the electrical zone-sensing principle.³ The analyzer is fitted and calibrated with an aperture tube having a 50- μ m orifice. The multichannel particle analyzer is equipped with software capable of data-smoothing, data extrapolation, distribution graphing, and data conversion. Analyze the *Blank solution*, the *Reference solution*, and the *Test solution* as directed for *Procedure*: the total count in the *Blank solution* is not more than 500; the mean particle diameter of microspheres in the *Reference solution* is within 5% of the mean particle diameter of microspheres in the *Reference stock solution*; the concentration of the *Reference solution* is within 10% of the concentration of the *Reference stock solution*; and the coincidence effect in the analysis of the *Test solution* is not more than 5%.

Procedure—Rinse the orifice of the aperture tube with *Electrolyte solution* before and after analyzing each preparation. Place the *Blank solution* in the apparatus, and adjust the vacuum on the sample stand so that the counting begins about 12 seconds after the analyzer is set to the counting position. Set the data acquisition to stop when one of the following conditions is met: preset length of time, preset volume, preset number of counts in any channel, or total counts. Collect the count versus the channel data for the *Blank solution*, and analyze using the data-smoothing, data extrapolation, distribution graphing, and data conversion features of the system software. In the same manner, analyze the *Reference solution* and the *Test solution*. The *Test solution* data are normalized and expressed as the number of microspheres per mL: the concentration of microspheres is between 5.0×10^8 and 8.0×10^8 per mL. Calculate the

percentage of microspheres less than 10 μ m in size in the portion of Injectable Suspension taken by the formula:

$$100(P_A / P_B)$$

in which P_A is the number of microspheres in the 1- to 10- μ m size range, and P_B is the number of microsphere particles in the 1- to 32- μ m size range. Not fewer than 93% of microsphere particles is smaller than 10 μ m.

Container headspace content—

Reference solutions—Use 99% perflutren reference standard⁴ (electronic grade perflutren gas of at least 99 molar % purity) and 60% perflutren reference standard⁴ (an electronic grade gas in air mixture containing 60 molar % perflutren gas).

Blank solution—Use ambient air.

Test solution—Use gas from the container headspace.

Chromatographic system (see *Chromatography* (621))—The gas chromatograph is equipped with a thermal conductivity detector and a 0.53-mm \times 25-m fused-silica (porous layer open tubular) column coated with Al_2O_3 / KCl (aluminum oxide deactivated with potassium chloride).⁵ The carrier gas is helium with a flow rate adjusted to obtain a retention time of about 1.5 to 1.8 minutes for perflutren. The column temperature is maintained at about 65°, the injection port temperature is maintained at about 130°, and the detector temperature is maintained at about 180°. Chromatograph the *Reference solutions* as directed for *Procedure*: the resolution, R , between perflutren and air is not less than 2; and the relative standard deviation for replicate injections is not more than 5%. The measured value for the 99% perflutren reference standard is within 5% of the nominal value.

Procedure—Using a gas-tight syringe, separately inject 10 μ L of the *Blank solution*, the *Reference solutions*, and the *Test solution* into the chromatograph. Record the chromatograms, and measure the responses for the major peaks. The percentages of perflutren in the 99% perflutren reference standard and in the *Test solution* are calculated by comparing the peak areas in each with the peak areas obtained from the 60% perflutren reference standard. The container headspace of Injectable Suspension contains not less than 60% of perflutren gas.

Microsphere perflutren content—

Reference stock solutions—The 97% decafluorobutane reference standard is decafluorobutane gas of at least 97 molar % purity.⁶ The 5% decafluorobutane–5% perflutren reference standard is a mixture containing 5 molar % decafluorobutane gas and 5 molar % perflutren gas in air.⁷ The 99% perflutren reference standard is electronic grade perflutren gas of at least 99 molar % purity.⁴

Analysis vial—Transfer 100 μ L of 97% decafluorobutane reference standard gas and 100 μ L of glacial acetic acid to a 2-mL vial equipped with a septum cap.

Reference solution—Transfer 100 μ L of 99% perflutren reference standard and 0.75 mL of 1% Albumin Human to an *Analysis vial*, and incubate by mixing for at least 3 hours.

Test solution—Allow a vial of the Injectable Suspension to equilibrate to room temperature. Invert the vial, and gently rotate to resuspend the microspheres. [NOTE—After resuspension, the contents of the vial should appear as a homogeneous, opaque, milky-white suspension.] Withdraw 0.75 mL of Injectable Suspension, and transfer to another *Analysis vial*. Incubate the *Test solution* by mixing for at least 3 hours.

⁴ A suitable grade of perflutren (octafluoropropane) is available from Air Products and Chemicals, Inc., Allentown, PA.

⁵ The column is available from Varian U.S.A. Chrompack, Walnut Creek, CA, catalog number CP7517, as an Al_2O_3 /KCl PLOT column (0.53-mm ID, 25-m length).

⁶ The gas is available under product code 03047567SR-LD from Scott Medical Products, Plumsteadville, PA.

⁷ The mixture of the two gases in air is available under product code 03047566SR-LD from Scott Medical Products, Plumsteadville, PA.

² Microspheres with a mean particle diameter of 5 μ m are available as NIST traceable Dynospheres from Bangs Laboratories, Inc., Fishers, IN.

³ A suitable multichannel particle analyzer is available as the Multisizer Model IIe from Beckman Coulter, Inc., Fullerton, CA.

Chromatographic system (see *Chromatography* <621>).—Prepare as directed for *Container headspace content*. The carrier gas is helium with a flow rate adjusted to obtain the following retention times: 1.0 to 1.1 minutes for air, 1.3 to 1.5 minutes for perflutren, and 1.5 to 2.5 minutes for decafluorobutane. The column temperature is maintained at about 85°, and then after elution of the perflutren the temperature is increased at a rate of 50° per minute to 120°, and maintained at 120° for 2 minutes. The injection port temperature is maintained at about 130°, and the detector temperature is maintained at about 180°. Chromatograph the 5% decafluorobutane–5% perflutren reference standard and the *Reference solution* as directed for *Procedure*: the resolution, R , between air and perflutren is not less than 2; the resolution, R , between perflutren and decafluorobutane is not less than 5; the relative standard deviation determined from the perflutren peak response for the *Reference solution* is not more than 5%; and the relative standard deviation determined from the response ratios for replicate injections of the 5% decafluorobutane–5% perflutren reference standard is not more than 5%.

Procedure—Inject 20 μ L of the headspace gas from the vials containing the *Reference solution* and the *Test solution* into the gas chromatograph. Record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg per mL, of perflutren in the portion of *Injectable Suspension* taken by the formula:

$$(0.188M/V)(R_S / R_U)$$

in which M is the number of μ moles of decafluorobutane in an *Analysis vial* after addition of the *Injectable Suspension*; V is the volume, in mL, of *Injectable Suspension* added to the *Analysis vial*; and R_S and R_U are the peak area ratios of decafluorobutane to perflutren obtained from the *Reference solution* and the *Test solution*, respectively. The quantity of perflutren in the *Injectable Suspension* is between 0.11 mg per mL and 0.33 mg per mL.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products (Parenterals)*—*Product Quality Tests* <1>; with the exception of *Foreign and Particulate Matter*.

Assay for protein—

Diluted antifoam reagent—Transfer 100 μ L of antifoam reagent⁸ to a suitable container, and dilute with water to 10 mL.

Blank preparation—Transfer 500 μ L of Sodium Chloride Injection to a culture tube. Dilute the contents of the tube with water to 2 mL, and add 10 μ L of *Diluted antifoam reagent*.

Standard preparations—Transfer 25-, 50-, 62.5-, 75-, and 100- μ L aliquots of protein standard solution⁹ containing 8 g per dL into separate tubes. Dilute the contents of each tube with water to 2.00 mL, and add 10 μ L of the *Diluted antifoam reagent* to each tube. During the *Procedure*, the addition of 3.0 mL of biuret reagent TS to each of the tubes produces *Standard preparations* with protein concentrations of 0.4, 0.8, 1.0, 1.2, and 1.6 mg per mL.

Assay preparation—Equilibrate each container of *Injectable Suspension* to room temperature, and mix each for at least 5 minutes to ensure a homogeneous suspension. Vent the container, and transfer 500- μ L aliquots into separate tubes. Dilute the contents of each tube with water to 2 mL, and add 10 μ L of *Diluted antifoam reagent*.

Procedure—To each of the tubes containing the *Blank preparation*, *Standard preparations*, and *Assay preparation*, add 3.0 mL of biuret reagent TS, mix, and allow to stand for 30 minutes, accurately timed, for maximum color development. The *Blank preparation*, *Standard preparations*, and *Assay preparation* are treated identically.

Using the *Blank preparation*, set the absorbance equal to zero. Determine the absorbance of each of the *Standard preparations* and the *Assay preparation* in 1-cm cells with a suitable spectrophotometer at a wavelength of 540 nm. Using linear regression, analyze the data obtained for each of the *Standard preparations*. Calculate the correlation coefficient, slope, and y-intercept values: the correlation coefficient is not less than 0.995. Calculate the quantity, in mg, of protein in each mL of the *Injectable Suspension* by the formula:

$$10[(A_U - y\text{-intercept})/\text{slope}]$$

in which 10 is the dilution factor; and A_U is the absorbance of the *Assay preparation*: the calculated quantity of protein in the *Injectable Suspension* is between 8 and 12 mg per mL.

Pergolide Mesylate

$C_{19}H_{26}N_2S \cdot CH_4O_3S$ 410.59

Ergoline, 8-[(methylthio)methyl]-6-propyl-, monomethanesulfonate, (8 β)-.

8 β -[(Methylthio)methyl]-6-propylergoline monomethanesulfonate [66104-23-2].

» Pergolide Mesylate contains not less than 97.5 percent and not more than 102.0 percent of $C_{19}H_{26}N_2S \cdot CH_4O_3S$, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards <11>—

USP Pergolide Mesylate RS

USP Pergolide Sulfonate RS

(8 β)-8-[(Methylsulfinyl)methyl]-6-propyl-D-ergoline.

Identification, *Infrared Absorption* <197K>.

Specific rotation <781S>: between –17° and –23° at 20°.

Test solution: 10 mg per mL, in dimethylformamide.

Loss on drying <731>—Dry it in vacuum at 105° for 1 hour: it loses not more than 0.5% of its weight.

Residue on ignition <281>: not more than 0.1%.

Delete the following:

• **Heavy metals**, *Method II* <231>: 0.001%. • (Official 1-Jan-2018)

Chromatographic purity—

Solution A—Prepare a filtered and degassed mixture of 5.0 mL of morpholine with 995 mL of water, and adjust with phosphoric acid to a pH of 7.0.

Solution B—Prepare a filtered and degassed mixture of methanol, acetonitrile, and tetrahydrofuran (1:1:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system* (see *System Suitability* under *Chromatography* <621>).

Standard solution 1—Dissolve an accurately weighed quantity of USP Pergolide Mesylate RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol

⁸ Available as Antifoam Reagent, catalog number 2210, from Dow Corning Corporation, Midland, MI.

⁹ Available as Bovine Serum Albumin, SRM 927c, Standard Reference Materials, National Institute of Standards and Technology, Gaithersburg, MD.

to obtain a solution having a known concentration of about 30 µg per mL.

Standard solution 2—Dilute 10.0 mL of *Standard solution 1* to 50 mL with methanol.

Test solution—Transfer about 60 mg of Pergolide Mesylate, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 25-cm column that contains base-deactivated packing L1. The flow rate is about 1 mL per minute. The column temperature is maintained at 40°. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	70	30	equilibration
0–35	70→0	30→100	linear gradient

Chromatograph *Standard solution 1*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 10,000 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of *Standard solution 1*, *Standard solution 2*, the *Test solution*, and a methanol blank into the chromatograph, record the chromatograms, and measure all of the peak responses. Disregard the contributions due to any peaks found in the methanol blank. The sum of the peak responses, excluding that of pergolide, from the *Test solution* is not more than the pergolide peak response obtained from *Standard solution 1* (0.5%), and no single peak response is more than the pergolide peak response obtained from *Standard solution 2* (0.1%).

Assay—**Diluent**—Dissolve 5 mg of methionine in 500 mL of 0.01 N hydrochloric acid. Add 500 mL of methanol, and mix.

Mobile phase—Prepare a solution of 0.009 M sodium 1-octanesulfonate containing 1.0 mL of glacial acetic acid per L. Prepare a filtered and degassed mixture of this solution, methanol, and acetonitrile (2:1:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Resolution solution—Dissolve about 4 mg of USP Pergolide Sulfoxide RS and 8 mg of USP Pergolide Mesylate RS in 50 mL of *Diluent*.

Standard preparation—Dissolve an accurately weighed quantity of USP Pergolide Mesylate RS in *Diluent*, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.13 mg per mL.

Assay preparation—Transfer about 6.5 mg of Pergolide Mesylate, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 25-cm column that contains base-deactivated packing L7. The flow rate is about 1 mL per minute. The column temperature is maintained at 40°. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between pergolide sulfoxide and pergolide is not less than 12.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the pergolide peaks. Calculate the

quantity, in mg, of $C_{19}H_{26}N_2S \cdot CH_3O_3S$ in the portion of Pergolide Mesylate taken by the formula:

$$50C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Pergolide Mesylate RS in the *Standard preparation*; and *r_U* and *r_S* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Pergolide Compounded Oral Suspension, Veterinary

DEFINITION

Pergolide Compounded Oral Suspension, Veterinary contains NLT 90.0% and NMT 110.0% of the labeled amount of pergolide ($C_{19}H_{26}N_2S$).

Prepare Pergolide Compounded Oral Suspension, Veterinary, 1 mg/mL, as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Pergolide (as Pergolide Mesylate, USP)	20 mg (26.11 mg)
Vehicle for Oral Suspension, NF	10 mL
Vehicle for Oral Solution, NF	10 mL

Connect an empty, calibrated, 35-mL Luer lock injection syringe to the port of a fluid-dispensing connector. Remove the plunger of another 35-mL Luer lock syringe, and set the plunger aside. Lock the barrel of this syringe onto the open port of the connector. Set this connected syringe apparatus in an upright, vertical position that is perpendicular to the work surface with the open syringe on top. Add the *Vehicle for Oral Suspension* and the *Pergolide Mesylate* into the open barrel. Replace the plunger on the open syringe, and invert the apparatus 180°. Apply 50 depressions to each syringe to mix. Consolidate the mixture into a single syringe. Disconnect the empty syringe. Add, via another 35-mL Luer lock injection syringe connected to the open port of the fluid-dispensing connector, a sufficient quantity of *Vehicle for Oral Solution* to bring the preparation to a final volume of 20 mL. Reattach the empty 35-mL syringe to the fluid-dispensing connector. Apply 50 depressions to each syringe to formulate a uniform suspension.

Alternatively, it may be prepared as follows. Add the *Pergolide Mesylate* to the mortar. Add the *Vehicle for Oral Suspension*, and mix to form a uniform paste. Add the *Vehicle for Oral Solution* in small portions almost to a final volume of 20 mL, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add sufficient *Vehicle for Oral Solution* to bring the preparation to a final volume of 20 mL, and mix well.

IDENTIFICATION

- A.** The retention time of the pergolide peak of the *Sample solution* corresponds to that of the *Standard solutions*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Solution A: 0.5 M sodium octanesulfonate solution and water (2:98), adjusted with glacial acetic acid to a pH of 2.2

Mobile phase: Acetonitrile and *Solution A* (50:50)
Diluent: Methanol and 0.01 N hydrochloric acid (50:50)

Standard stock solution: 1.0 mg/mL of USP Pergolide Mesylate RS in methanol prepared in low-actinic glassware

Standard solutions: Prepare five solutions of known concentrations of about 20, 10, 5, 2, and 1 µg/mL of pergolide mesylate by quantitatively diluting the *Standard stock solution* with *Mobile phase*. Use low-actinic glassware.

Sample solution: Transfer 500 µL of Oral Suspension, Veterinary to a 5-mL volumetric flask, and dilute with *Diluent* to volume. Further dilute an aliquot of the solution with *Mobile phase* to obtain a solution with a nominal concentration of 10 µg/mL of pergolide. Use low-actinic glassware.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 223 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Column temperature: 40°

Flow rate: 1 mL/min

Injection volume: 25 µL

System suitability

Samples: *Standard solutions* and *Sample solution*

Suitability requirements

Tailing factor: NMT 2.0, *Standard solution* (20 µg/mL)

Relative standard deviation: NMT 2.0% for replicate injections, *Standard solution* (20 µg/mL)

Correlation coefficient: NLT 0.995, linear regression of the *Standard solutions*

Resolution: NLT 2.0, *Sample solution*

Analysis

Samples: *Standard solutions* and *Sample solution*

Generate a regression curve of peak height versus pergolide mesylate concentration, and calculate the equation for the linear regression line.

Calculate the percentage of the labeled amount of pergolide ($C_{19}H_{26}N_2S$) in the portion of Oral Suspension, Veterinary taken. Use the molecular weights of pergolide and pergolide mesylate, 314.50 and 410.60, respectively.

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- **pH (791):** 4.0–4.2

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers, and store in a refrigerator.
- **BEYOND-USE DATE:** NMT 14 days after the date on which it was compounded when stored in a refrigerator
- **LABELING:** Label to state that it is to be well shaken before use, protected from light, and to state the *Beyond-Use Date*. Label to indicate that it is for veterinary use only.
- **USP REFERENCE STANDARDS (11)**
USP Pergolide Mesylate RS

Pergolide Tablets

» Pergolide Tablets contain an amount of Pergolide Mesylate equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of pergolide ($C_{19}H_{26}N_2S$).

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Pergolide Mesylate RS

USP Pergolide Sulfoxide RS

(8β)-8-[(Methylsulfinyl)methyl]-6-propyl-D-ergoline.

Thin-layer chromatographic identification test (201)—

Adsorbent: 0.25-mm layer of binder-free silica gel.

Test solution—Transfer a number of Tablets, equivalent to 1 mg of pergolide, to a separator containing 20 mL of methylene chloride and 10 mL of 0.1 N sodium hydroxide. Shake until the Tablets have disintegrated, allow the layers to separate, and drain the methylene chloride layer through a small funnel containing about 1 g of anhydrous sodium sulfate, collecting the filtrate in a suitable stoppered vessel. Wash the sodium sulfate with a few mL of methylene chloride, adding these washes to the filtrate, and evaporate to dryness under a stream of nitrogen. Redissolve the residue in 2 mL of a mixture of methylene chloride and methanol (1:1).

Standard solution: 0.65 mg per mL, in a mixture of methylene chloride and methanol (1:1).

Application volume: 20 µL.

Developing solvent system: a mixture of chloroform, methanol, and ethyl acetate (8:1:1). Allow the plate to equilibrate for about 10 minutes in the developing chamber prior to development.

Procedure—Proceed as directed in the chapter. Place the plate in a chamber containing iodine vapors, and locate the spots.

Dissolution (711)—

Medium: simulated gastric fluid TS (without enzymes) containing 20 µg of L-cysteine per mL; 500 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Determine the amount of $C_{19}H_{26}N_2S$ dissolved by employing the following method.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile, water, and triethylamine, (21:19:0.08). Adjust with phosphoric acid to a pH of 5.0. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Triethylamine phosphate suspension—Add 1.0 mL of triethylamine to 500 mL of acetonitrile, mix, and adjust with phosphoric acid to a pH of 5.0. A white precipitate will form. Stir continuously during use.

Resolution solution—Prepare a solution of USP Pergolide Mesylate RS and USP Pergolide Sulfoxide RS containing a known amount of each equivalent to the labeled amount of pergolide in each 500 mL of *Medium*.

Standard solution—Transfer about 16 mg of USP Pergolide Mesylate RS, accurately weighed, to a 250-mL volumetric flask, dissolve in 10.0 mL of methanol, dilute with *Medium* to volume, and mix. Dilute this solution quantitatively and stepwise with *Medium* to obtain a solution having a known concentration equivalent to the labeled amount of pergolide in each 500 mL.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a fluorometer set to an excitation wavelength of 224 nm and an emission wavelength of 350 nm and with a 4.6-mm × 15-cm column that contains base-deactivated packing L10. The flow rate is about 2 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between pergolide sulfoxide and pergolide is not less than 1.0. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections, determined from the pergolide peak, is not more than 2.0%.

Procedure—Immediately before injection, pipet 2.0 mL of *Triethylamine phosphate suspension*, continuously stirred, into a suitable container containing 5.0 mL of the solution for injection, and mix to obtain a clear solution. Separately inject equal volumes (about 200 µL) of the *Standard solution* and filtered portions of the solutions under test into the

chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the amount, in mg, of pergolide ($C_{19}H_{26}N_2S$) dissolved by the formula:

$$500C(314.50/410.60)(r_U / r_S)$$

in which C is the concentration, in μg per mL, of USP Pergolide Mesylate RS in the *Standard solution*; 314.50 and 410.60 are the molecular weights of pergolide and pergolide mesylate, respectively; and r_U and r_S are the peak areas obtained from the solution under test and the *Standard solution*, respectively.

Tolerances—Not less than 75% (Q) of the labeled amount of $C_{19}H_{26}N_2S$ is dissolved in 30 minutes.

Uniformity of dosage units (905): meet the requirements.

Chromatographic purity—

Mobile phase, System suitability solution, Standard preparation, and Chromatographic system—Proceed as directed in the Assay.

Diluted standard preparation—Transfer 3.0 mL of the *Standard preparation* to a 50-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix.

Test preparation—Use the *Assay preparation*.

Procedure—Separately inject equal volumes (about 100 μL) of the *Diluted standard preparation* and the *Test preparation* into the chromatograph, and measure all of the peak responses. Calculate the percentage of each impurity in the Tablets by the formula:

$$20C(314.50/410.60)(r_i / r_S)$$

in which C is the concentration, in μg per mL, of USP Pergolide Mesylate RS in the *Diluted standard preparation*; 314.50 and 410.60 are the molecular weights of pergolide and pergolide mesylate, respectively; r_i is the peak response of the individual impurity obtained from the *Test preparation*; and r_S is the peak response of pergolide obtained from the *Diluted standard preparation*: not more than 6.0% of pergolide sulfoxide is found; not more than 0.5% of any individual impurity, excluding pergolide sulfoxide, is found; and not more than 1.0% of total impurities, excluding pergolide sulfoxide, is found.

Assay—

Mobile phase—Prepare a solution of 0.038 M sodium 1-octanesulfonate containing 0.0077 mg of methionine per mL and 2.45 mL of glacial acetic acid per L. Adjust with 5 N sodium hydroxide to a pH of 4.1. Prepare a filtered and degassed mixture of this solution and acetonitrile (65:35). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

System suitability solution—Prepare a solution of USP Pergolide Mesylate RS and USP Pergolide Sulfoxide RS in *Mobile phase* having a known concentration of about 6.5 μg per mL of pergolide mesylate and 0.1 μg per mL of pergolide sulfoxide.

Standard preparation—Dissolve an accurately weighed quantity of USP Pergolide Mesylate RS in *Mobile phase*, and dilute quantitatively and stepwise with *Mobile phase* to obtain a solution having a known concentration of about 6.5 μg per mL.

Assay preparation—Place 20 whole Tablets into a suitable stoppered container, add *Mobile phase*, shake and sonicate until the Tablets have dissolved, and quantitatively dilute to obtain a solution containing about 5 μg per mL of pergolide.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a fluorometer set to an excitation wavelength of 280 nm and an emission wavelength of 335 nm and with a 4.6-mm \times 7.5-cm col-

umn that contains base-deactivated packing L7. The flow rate is about 1.5 mL per minute. The column temperature is maintained at 35°. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*; the resolution, R , between pergolide sulfoxide and pergolide is not less than 12.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 100 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, and measure the responses for the major peaks. Calculate the quantity, in mg, of pergolide ($C_{19}H_{26}N_2S$) in the portion of Tablets taken by the formula:

$$0.001C(314.50/410.60)(r_U / r_S)$$

in which C is the concentration, in μg per mL, of USP Pergolide Mesylate RS in the *Standard preparation*; 314.50 and 410.60 are the molecular weights of pergolide and pergolide mesylate, respectively; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Perindopril Erbumine

$C_{19}H_{32}N_2O_5 \cdot C_4H_{11}N$ 441.6
1*H*-Indole-2-carboxylic acid, 1-[2-[[1-(ethoxycarbonyl)butylamino]-1-oxopropyl]octahydro-, [2*S*-[1[*R**(*R**)], 2 α , 3 $\alpha\beta$, 7 $\alpha\beta$]-, compound with 2-methyl-2-propanamine (1:1); (2*S*, 3 α *S*, 7 α *S*)-1-[(*S*)-*N*-[(*S*)-1-Carboxybutyl]alanyl]hexahydro-2-indolinecarboxylic acid, 1-ethyl ester, compound with *tert*-butylamine (1:1); (2*S*, 3 α *S*, 7 α *S*)-1-[(*S*)-2-[(*R*)-1-Ethoxy-1-oxopentan-2-ylamino]propanoyl]octahydro-1*H*-indole-2-carboxylic acid [107133-36-8].

DEFINITION

Perindopril Erbumine contains NLT 98.0% and NMT 102.0% of perindopril erbumine ($C_{19}H_{32}N_2O_5 \cdot C_4H_{11}N$), calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of *System suitability solution* 1, as obtained in the test for *Limit of Perindopril Related Compound I*.

ASSAY

• PROCEDURE

Buffer: Dissolve 0.92 g of sodium 1-heptanesulfonate in 1 L of water and add 1 mL of triethylamine. Adjust with a solution of perchloric acid and water (1:1) to a pH of 2.0.

Mobile phase: Acetonitrile and *Buffer* (35:65)

Standard solution: 0.1 mg/mL of USP Perindopril Erbumine RS in *Buffer*. Initially add *Buffer* to about 60% of the flask volume, sonicate to dissolve, and dilute with *Buffer* to volume.

Sample solution: 0.1 mg/mL of Perindopril Erbumine in *Buffer*. Initially add *Buffer* to about 60% of the flask volume, sonicate to dissolve, and dilute with *Buffer* to volume.

Chromatographic system(See *Chromatography* (621), *System Suitability*.)**Mode:** LC**Detector:** UV 215 nm**Column:** 4.6-mm × 25-cm; 5-μm packing L7**Column temperature:** 60°**Flow rate:** 1 mL/min**Injection volume:** 20 μL**System suitability****Sample:** *Standard solution***Suitability requirements****Tailing factor:** NMT 2.0**Relative standard deviation:** NMT 0.5%**Analysis****Samples:** *Standard solution* and *Sample solution*Calculate the percentage of perindopril erbumine ($C_{19}H_{32}N_2O_5 \cdot C_4H_{11}N$) in the portion of Perindopril Erbumine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 r_U = peak area of perindopril from the *Sample solution* r_S = peak area of perindopril from the *Standard solution* C_S = concentration of USP Perindopril Erbumine RS in the *Standard solution* (mg/mL) C_U = concentration of Perindopril Erbumine in the *Sample solution* (mg/mL)**Acceptance criteria:** 98.0%–102.0% on the anhydrous basis**IMPURITIES**

Perindopril Erbumine Tablets

DEFINITION

Perindopril Erbumine Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of perindopril erbumine ($C_{19}H_{32}N_2O_5 \cdot C_4H_{11}N$).

IDENTIFICATION

- **A.** The UV absorption spectra of the major peak of the *Sample solution* exhibit maxima and minima at the same wavelengths as those of the corresponding peak of the *Standard solution*, as obtained in the Assay.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

PROCEDURE

Solution A: Dissolve 0.92 g of sodium 1-heptanesulfonate in 1 L of water and add 1 mL of triethylamine. Adjust with a solution of perchloric acid and water (1:1) to a pH of 2.0.

Mobile phase: Acetonitrile and *Solution A* (38:62)

Diluent: Acetonitrile and *Solution A* (40:60)

Standard solution: 0.08 mg/mL of USP Perindopril Erbumine RS in *Diluent* prepared as follows. Dissolve a suitable quantity of USP Perindopril Erbumine RS in 80% of the total volume of *Diluent*, sonicate for 5 min, and dilute with *Diluent* to volume. Pass through a suitable filter of 0.45- μ m pore size and discard the first 3 mL of filtrate.

Sample solution: Nominally equivalent to 0.08 mg/mL of perindopril erbumine in *Diluent* prepared as follows. Weigh and transfer the number of Tablets into a suitable volumetric flask, as indicated in *Table 1*.

Table 1

Tablet Strength (mg)	Number of Tablets (NLT)	Volumetric Flask (mL)
2	20	500
4	10	500
8	10	1000

Add *Diluent* to about 70% of the flask volume, shake mechanically for about 60 min at 180 rpm, and sonicate for 20 min. Dilute with *Diluent* to volume. Pass through a suitable filter of 0.45- μ m pore size and discard the first 3 mL of filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4-mm \times 25-cm; 4- μ m packing L7

Temperatures

Column: 60°

Sample cooler: 5°

Flow rate: 1 mL/min

Injection volume: 20 μ L

Run time: NLT 2.5 times the retention time of perindopril

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of perindopril erbumine ($C_{19}H_{32}N_2O_5 \cdot C_4H_{11}N$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Perindopril Erbumine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of perindopril erbumine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 30 min

Solution A: Proceed as directed in the Assay.

Mobile phase: Acetonitrile and Solution A (350:650)

Standard stock solution: 0.55 mg/mL of USP Perindopril Erbumine RS in acetonitrile

Standard solution: Prepare solutions of USP Perindopril Erbumine RS in Medium from the Standard stock solution, with final concentrations from Table 2.

Table 2

Tablet Strength (mg)	Concentration (mg/mL)
2	0.0022
4	0.0044
8	0.0088

Sample solution: Pass a portion of the solution under test through a suitable filter and discard the first 1 mL of filtrate.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm × 15-cm; 5-μm packing L7

Column temperature: 50°

Flow rate: 1.2 mL/min

Injection volume: 100 μL

Run time: NLT 1.6 times the retention time of perindopril

System suitability

Sample: Standard solution

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of perindopril erbumine ($C_{19}H_{32}N_2O_5 \cdot C_4H_{11}N$) dissolved.

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response from the Sample solution

r_S = peak response from the Standard solution

C_S = concentration of the Standard solution (mg/mL)

L = label claim (mg/Tablet)

V = volume of Medium, 900 mL

Tolerances: NLT 85% (Q) of the labeled amount of perindopril erbumine ($C_{19}H_{32}N_2O_5 \cdot C_4H_{11}N$) is dissolved.

• UNIFORMITY OF DOSAGE UNITS (905): Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

Solution A: Proceed as directed in the Assay.

Solution B: Acetonitrile

Mobile phase: See Table 3.

Table 3

Time (min)	Solution A (%)	Solution B (%)
0	80	20
5	80	20
27	68	32
45	50	50

Table 3 (Continued)

Time (min)	Solution A (%)	Solution B (%)
60	20	80
70	20	80
71	80	20
80	80	20

Diluent: Solution B and Solution A (20:80)

System suitability stock solution A: 0.03 mg/mL of USP Imidazole RS in Diluent

System suitability stock solution B: 0.12 mg/mL each of USP Perindopril Related Compound C RS and USP Perindopril Related Compound D RS in Diluent. Initially add 80% of the total volume of Diluent, sonicate for 5 min, and dilute with Diluent to volume.

System suitability solution: Accurately weigh about 1.5 mg each of USP Perindopril Related Compound B RS and USP Perindopril Related Compound F RS into a 50-mL volumetric flask. Add 30 mL of Diluent and sonicate for 5 min. Transfer 5.0 mL each of System suitability stock solution A, System suitability stock solution B, and Standard stock solution. Dilute with Diluent to volume.

Standard stock solution: 0.05 mg/mL of USP Perindopril Erbumine RS in Diluent prepared as follows. Dissolve a suitable quantity of USP Perindopril Erbumine RS in 80% of the total volume of Diluent, sonicate for 5 min, and dilute with Diluent to volume.

Standard solution: 0.005 mg/mL of USP Perindopril Erbumine RS in Diluent from the Standard stock solution. Pass through a suitable filter of 0.45-μm pore size and discard the first 3 mL of filtrate.

Sample solution: Nominally equivalent to 2 mg/mL of perindopril erbumine in Diluent prepared as follows.

Transfer a quantity equivalent to about 20 mg of perindopril erbumine from powdered Tablets (NLT 20) into a test tube. Pipet 10.0 mL of Diluent into the test tube, sonicate for about 10 min, and vortex for about 1 min. Pass through a suitable filter of 0.45-μm pore size and discard the first 3 mL of filtrate.

Chromatographic system

(See Chromatography (621), System Suitability.)

Proceed as directed in the Assay, except for the Run time. [NOTE—The run time is determined by the gradient from Table 3.]

System suitability

Sample: System suitability solution

Suitability requirements

Tailing factor: NMT 1.5 for the perindopril peak

Relative standard deviation: NMT 5.0% for the perindopril peak

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each impurity from the Sample solution

r_S = peak response of perindopril erbumine from the Standard solution

C_S = concentration of USP Perindopril Erbumine RS in the Standard solution (mg/mL)

C_U = nominal concentration of perindopril erbumine in the Sample solution (mg/mL)

F = relative response factor for each individual impurity (see Table 4)

Acceptance criteria: See Table 4. Disregard peaks less than 0.1%.

Table 4

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Imidazole ^a	0.08	—	—
Perindopril related compound B ^b	0.42	1.21	2.0
Perindopril related compound C ^c	0.74	0.97	0.5
Perindopril related compound D ^d	0.85	0.98	0.5
Perindopril erbumine	1.0	—	—
Perindopril related compound F ^e	1.38	0.86	3.0
Any unspecified impurity	—	—	0.2
Total impurities ^f	—	—	1.5

^a Imidazole is given for identification only and is not quantitated using this procedure.

^b (2S,3aS,7aS)-1-[(S)-2-[(S)-1-Carboxybutylamino]propanoyl]octahydro-1H-indole-2-carboxylic acid.

^c (S)-2-[(3S,5aS,9aS,10aS)-3-Methyl-1,4-dioxodecahydropyrazino[1,2-a]indol-2(1H)-yl]pentanoic acid.

^d (S)-2-[(3S,5aS,9aS,10aR)-3-Methyl-1,4-dioxodecahydropyrazino[1,2-a]indol-2(1H)-yl]pentanoic acid.

^e (S)-Ethyl 2-[(3S,5aS,9aS,10aS)-3-methyl-1,4-dioxodecahydropyrazino[1,2-a]indol-2(1H)-yl]pentanoate.

^f Total impurities excludes perindopril related compound F and perindopril related compound B.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in air-tight containers. Protect from heat and moisture.

• USP REFERENCE STANDARDS (11)

USP Imidazole RS

USP Perindopril Erbumine RS

USP Perindopril Related Compound B RS

(2S,3aS,7aS)-1-[(S)-2-[(S)-1-Carboxybutylamino]propanoyl]octahydro-1H-indole-2-carboxylic acid.

C₁₇H₂₈N₂O₅ 340.41

USP Perindopril Related Compound C RS

(S)-2-[(3S,5aS,9aS,10aS)-3-Methyl-1,4-dioxodecahydropyrazino[1,2-a]indol-2(1H)-yl]pentanoic acid.

C₁₇H₂₆N₂O₄ 322.40

C₁₇H₂₆N₂O₄ 322.40

USP Perindopril Related Compound F RS

(S)-Ethyl 2-[(3S,5aS,9aS,10aS)-3-methyl-1,4-dioxodecahydropyrazino[1,2-a]indol-2(1H)-yl]pentanoate.

C₁₉H₃₀N₂O₄ 350.45

Perphenazine

C₂₁H₂₆ClN₃OS 403.97
Piperazineethanol, 4-[3-(2-chloro-10H-phenothiazin-10-yl)propyl];

4-[3-(2-Chlorophenothiazin-10-yl)propyl]-1-piperazineethanol [58-39-9].

DEFINITION

Perphenazine contains NLT 98.0% and NMT 102.0% of perphenazine (C₂₁H₂₆ClN₃OS), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197M)**

- **B.** The retention time of the major peak of the *Diluted sample solution* corresponds to that of the *Standard solution*, as obtained in the test for *Organic Impurities*.

ASSAY

• PROCEDURE

Sample solution: Dissolve 0.150 g of Perphenazine in 25 mL of glacial acetic acid.

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 N perchloric acid VS

Endpoint detection: Potentiometric

Analysis

Sample: *Sample solution*

Titrate the *Sample solution* with *Titrant*. Carry out a blank titration.

Calculate the percentage of perphenazine

(C₂₁H₂₆ClN₃OS) in the portion of Perphenazine taken:

$$\text{Result} = [(V - B) \times N \times F/W] \times 100$$

V = *Titrant* volume consumed by the *Sample* (mL)

B = *Titrant* volume consumed by the blank (mL)

N = normality of the *Titrant* (meq/mL)

F = equivalent weight of perphenazine, 202.0 mg/meq

W = *Sample* weight (mg)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION (281):** NMT 0.1%

• ORGANIC IMPURITIES

Prepare the solutions immediately before use. Carry out the test protected from light.

Solution A: Acetonitrile and 7 g/L of monobasic sodium phosphate dihydrate in water (35:65)

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
5	100	0
10	80	20
33	30	70
48	100	0

System suitability solution: 2 mg/mL of USP Perphenazine RS, 0.002 mg/mL of USP Perphenazine Sulfoxide RS, and 0.002 mg/mL of USP Perphenazine Related Compound B RS in *Solution A*

Standard solution: 0.002 mg/mL of USP Perphenazine RS in *Solution A*

Sample solution: 2 mg/mL of Perphenazine in *Solution A*

Diluted sample solution: 0.002 mg/mL of Perphenazine in *Solution A* from the *Sample solution*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC
 Detector: UV 245 nm
 Column: 4.6-mm × 25-cm; 4-μm packing L7
 Column temperature: 30°
 Flow rate: 1.3 mL/min
 Injection volume: 10 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—See Table 2 for relative retention times.]

Suitability requirements

Resolution: NLT 3.0 between perphenazine and perphenazine related compound B, *System suitability solution*

Tailing factor: NMT 2.5, *Standard solution*

Relative standard deviation: NMT 10.0%, *Standard solution*

Analysis

Samples: *Standard solution*, *Sample solution*, and *Diluted sample solution*. [NOTE—*Diluted sample solution* is used for *Identification test B*.]

Calculate the percentage of impurities in the portion of Perphenazine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response for each impurity from the *Sample solution*

r_S = peak response of perphenazine from the *Standard solution*

C_S = concentration of USP Perphenazine RS in the *Standard solution* (mg/mL)

C_U = concentration of Perphenazine in the *Sample solution* (mg/mL)

F = relative response factor (see Table 2)

Acceptance criteria: See Table 2.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Perphenazine sulfoxide	0.3	1.6	0.2
Perphenazine related compound B	0.8	1.0	0.5
Perphenazine	1.0	—	—
Any individual unspecified impurity	—	1.0	0.10
Total impurities	—	—	1.0

SPECIFIC TESTS

• LOSS ON DRYING (731)

Analysis: Dry a sample in a vacuum at 65° for 4 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• USP REFERENCE STANDARDS (11)

USP Perphenazine RS

USP Perphenazine Related Compound B RS

2-[4-[3-(10*H*-Phenothiazin-10-yl)propyl]piperazin-1-yl]ethanol.

$C_{21}H_{27}N_3OS$ 369.52

USP Perphenazine Sulfoxide RS

2-Chloro-10-[3-[4-(2-hydroxyethyl)piperazin-1-yl]propyl]-10*H*-phenothiazine 5-oxide.

$C_{21}H_{26}ClN_3O_2S$ 419.97

Perphenazine Injection

» Perphenazine Injection is a sterile solution of Perphenazine in Water for Injection, prepared with the aid of Citric Acid. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{21}H_{26}ClN_3OS$, as the citrate.

Packaging and storage—Preserve in single-dose or multiple-dose containers, preferably of Type I glass, protected from light.

USP Reference standards (11)—

USP Endotoxin RS

USP Perphenazine RS

NOTE—Throughout the following procedures, protect test or assay specimens, the USP Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.

Identification—Dilute 1 mL with methanol to 5 mL. Apply 5 μL each of this solution and a solution of USP Perphenazine RS in methanol containing 1 mg per mL to a suitable thin-layer chromatographic plate, coated with a 0.25-mm layer of chromatographic silica gel. Develop the chromatogram in a solvent system consisting of a mixture of acetone and ammonium hydroxide (200:1) until the solvent front has moved about 15 cm. Air-dry the plate, and spray lightly with a solution of iodoplatinic acid prepared by dissolving 100 mg of chloroplatinic acid in 1 mL of 1 N hydrochloric acid, adding 25 mL of potassium iodide solution (4 in 100), diluting with water to 100 mL, and adding 0.50 mL of formic acid: the R_f value of the principal spot obtained from the Injection corresponds to that obtained from the Standard solution.

Bacterial Endotoxins Test (85)—It contains not more than 35.7 USP Endotoxin Units per mg of perphenazine.

pH (791): between 4.2 and 5.6.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—

Acid-alcohol solution—Transfer 10 mL of hydrochloric acid to a 1000-mL flask containing 500 mL of alcohol and 300 mL of water. Dilute with water to volume.

Palladium chloride solution—Dissolve 100 mg of palladium chloride in a mixture of 1 mL of hydrochloric acid and 50 mL of water in a 100-mL volumetric flask, heating on a steam bath to effect solution. Cool, dilute with water to volume, and mix. Store in an amber bottle and use within 30 days. On the day of use, transfer 50 mL to a 500-mL volumetric flask, add 4 mL of hydrochloric acid and 4.1 g of anhydrous sodium acetate, dilute with water to volume, and mix.

Standard preparation—Dissolve an accurately weighed quantity of USP Perphenazine RS in *Acid-alcohol solution* to obtain a solution having a known concentration of about 150 μg per mL.

Assay preparation—Dilute 3.0 mL of Injection with *Acid-alcohol solution* to 100 mL in a volumetric flask.

Procedure—Mix 10.0 mL each of the *Assay preparation* and the *Standard preparation* with 15.0 mL of *Palladium chloride solution*, filter, if necessary, and concomitantly determine the absorbances of these solutions, against a reagent blank, in 1-cm cells at the wavelength of maximum absorbance at about 480 nm, with a suitable spectrophotometer.

Calculate the quantity, in mg, of $C_{21}H_{26}ClN_3OS$ in the volume of Injection taken by the formula:

$$0.1C(A_U / A_S)$$

in which C is the concentration, in μg per mL, of USP Perphenazine RS in the *Standard preparation*, and A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

Perphenazine Oral Solution

» Perphenazine Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of perphenazine ($C_{21}H_{26}ClN_3OS$).

Packaging and storage—Preserve in well-closed, light-resistant containers.

USP Reference standards (11)—
USP Perphenazine RS

NOTE—Throughout the following procedures, protect test or assay specimens, the USP Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.

Identification—It meets the requirements for the *Identification* test under *Perphenazine Injection*.

Uniformity of dosage units (905)—

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

Deliverable volume (698)—

FOR ORAL SOLUTION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

Limit of perphenazine sulfoxide—

Mobile phase, *Resolution solution*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay*.

Test preparation—Transfer an accurately measured portion of Oral Solution, equivalent to about 16 mg of perphenazine, to a 200-mL volumetric flask, dissolve in and dilute with methanol to volume, mix, and filter.

Procedure—Inject a volume (about 10 μL) of the *Test preparation* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of perphenazine sulfoxide in the portion of Oral Solution taken by the formula:

$$100(r_1 / r_s)$$

in which r_1 is the peak response of perphenazine sulfoxide (relative retention time of about 0.72); and r_s is the sum of the responses of all the peaks: not more than 5.0% of perphenazine sulfoxide is found.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of 0.01 M ammonium acetate, acetonitrile, and methanol (48:39:13). Adjust with glacial acetic acid to a pH of 4.5. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Resolution solution—Dissolve suitable quantities of brompheniramine maleate and USP Perphenazine RS in methanol to obtain a solution having known concentrations of about 40 μg per mL and 8 μg per mL, respectively.

Standard preparation—Dissolve an accurately weighed quantity of USP Perphenazine RS in methanol, dilute quantitatively, and stepwise if necessary, with methanol to obtain

a solution having a known concentration of about 8.0 μg per mL, and filter.

Assay preparation—Transfer an accurately measured portion of Oral Solution, equivalent to about 16 mg of perphenazine, to a 200-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix. Dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a concentration of about 8.0 μg per mL, and filter.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm \times 30-cm column that contains packing L11. The flow rate is about 1.5 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.6 for brompheniramine and 1.0 for perphenazine; and the resolution, R , between brompheniramine and perphenazine is not less than 3.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 3.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of perphenazine ($C_{21}H_{26}ClN_3OS$) in the portion of Oral Solution taken by the formula:

$$2000C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Perphenazine RS in the *Standard preparation*; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Perphenazine Syrup

» Perphenazine Syrup contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of perphenazine ($C_{21}H_{26}ClN_3OS$).

Packaging and storage—Preserve in well-closed, light-resistant containers.

USP Reference standards (11)—
USP Perphenazine RS

NOTE—Throughout the following procedures, protect test or assay specimens, the USP Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.

Identification—Add 10 mL of water to a volume of Syrup, equivalent to about 4 mg of perphenazine, render alkaline by dropwise addition of sodium hydroxide to a pH of 11 to 12, and extract with four 5-mL portions of chloroform, combining the extracts through a bed of anhydrous sodium sulfate in a funnel into a beaker. Evaporate the extracts on a steam bath nearly to dryness, and dissolve the residue in 4 mL of methanol: the solution so obtained responds to the *Identification* test under *Perphenazine Injection*.

Uniformity of dosage units (905)—

FOR SYRUP PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

Deliverable volume (698)—

FOR SYRUP PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

Assay—

Acid-alcohol solution and Palladium chloride solution—Prepare as directed in the Assay under *Perphenazine Injection*.

Standard preparation—Dissolve an accurately weighed quantity of USP Perphenazine RS in *Acid-alcohol solution* to obtain a solution having a known concentration of about 160 µg per mL.

Assay preparation—Transfer an accurately measured volume of Syrup, equivalent to about 6 mg of perphenazine, to a 25-mL volumetric flask, dilute with water to volume, and mix. Transfer 10 mL to a 125-mL separator, add 25 mL of water, adjust with ammonium hydroxide to a pH of 10 to 11, and extract with four 20-mL portions of chloroform, filtering the extracts through anhydrous sodium sulfate. Evaporate the combined extracts on a steam bath with the aid of a stream of nitrogen to about 5 mL. Complete the evaporation without application of heat, and dissolve the residue in 15.0 mL of *Acid-alcohol solution*, filtering if necessary.

Procedure—Mix 10.0 mL each of the *Assay preparation* and the *Standard preparation* with 15.0 mL of *Palladium chloride solution*, filter if necessary, and concomitantly determine the absorbances of these solutions, against a reagent blank, in 1-cm cells at the wavelength of maximum absorbance at about 480 nm, with a suitable spectrophotometer. Calculate the quantity, in mg, of perphenazine ($C_{21}H_{26}ClN_3OS$) in each mL of the Syrup taken by the formula:

$$0.0375(C/V)(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Perphenazine RS in the *Standard preparation*; V is the volume, in mL, of Syrup taken; and A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

Perphenazine Tablets

» Perphenazine Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{21}H_{26}ClN_3OS$.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—
USP Perphenazine RS

NOTE—Throughout the following procedures, protect test or assay specimens, the USP Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.

Identification—Shake a portion of finely powdered Tablets, equivalent to about 5 mg of perphenazine, with about 10 mL of chloroform, filter, evaporate the filtrate on a steam bath nearly to dryness, and dissolve the residue in 5 mL of methanol: the solution so obtained responds to the *Identification test* under *Perphenazine Injection*.

Dissolution (711)—

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 2: 50 rpm.

Time: 45 minutes.

Procedure—Determine the amount of $C_{21}H_{26}ClN_3OS$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 257 nm of filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Perphenazine RS in the same medium.

Tolerances—Not less than 75% (Q) of the labeled amount of $C_{21}H_{26}ClN_3OS$ is dissolved in 45 minutes.

Uniformity of dosage units (905): meet the requirements.

Assay—

Acid-alcohol solution and Palladium chloride solution—Prepare as directed in the Assay under *Perphenazine Injection*.

Standard preparation—Prepare as directed in the Assay under *Perphenazine Syrup*.

Assay preparation—Weigh and finely powder not less than 20 Tablets. Transfer a portion of the powder, equivalent to about 4 mg of perphenazine, to a glass-stoppered conical flask, pipet into the flask 25 mL of *Acid-alcohol solution*, shake by mechanical means for 30 minutes, and centrifuge a portion of the mixture. The clear supernatant fluid is the *Assay preparation*.

Procedure—Proceed as directed for *Procedure* in the Assay under *Perphenazine Injection*. Calculate the quantity, in mg, of $C_{21}H_{26}ClN_3OS$ in the portion of Tablets taken by the formula:

$$0.025C(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Perphenazine RS in the *Standard preparation*, and A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

Perphenazine and Amitriptyline Hydrochloride Tablets

» Perphenazine and Amitriptyline Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of perphenazine ($C_{21}H_{26}ClN_3OS$) and amitriptyline hydrochloride ($C_{20}H_{23}N \cdot HCl$).

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—
USP Amitriptyline Hydrochloride RS
USP Perphenazine RS

NOTE—Throughout the following procedures, protect test or assay specimens, the USP Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.

Identification—Transfer a portion of powdered Tablets, equivalent to about 40 mg of perphenazine, to a 100-mL volumetric flask containing about 50 mL of alcohol. Agitate for 20 minutes, add alcohol to volume, mix, and filter or centrifuge. Separately prepare two Standard solutions containing 0.4 mg per mL of USP Perphenazine RS and USP Amitriptyline Hydrochloride RS, respectively, in alcohol. Separately apply 5 µL of the test solution and 5 µL of each Standard solution to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Develop the chromatogram using a solvent system consisting of a mixture of cyclohexane, ethyl acetate, and diethylamine (85:25:5) until the solvent front has moved about 15 cm. Remove the plate from the developing chamber, air-dry for 20 minutes, and examine the plate under short-wavelength UV light: the R_f values of the principal spots obtained from the test solution correspond to those obtained from the Standard solutions.

Dissolution (711)—

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 2: 50 rpm.

Time: 60 minutes.

Procedure—[NOTE—Due to potential decrease in the recovery of perphenazine when multiple injections are made from a vial, no more than two withdrawals should be made from any single vial.] Determine the amounts of perphenazine and amitriptyline hydrochloride in solution in filtered portions of the solution under test, in comparison with a Standard solution having known concentrations of USP Perphenazine RS and USP Amitriptyline Hydrochloride RS in the same medium, as directed for *Procedure* in the *Assay*.

Tolerances—Not less than 75% (Q) of the labeled amounts of perphenazine ($C_{21}H_{26}ClN_3OS$) and amitriptyline hydrochloride ($C_{20}H_{23}N \cdot HCl$) is dissolved in 60 minutes.

Uniformity of dosage units (905): meet the requirements for *Content uniformity* with respect to perphenazine and to amitriptyline hydrochloride.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of water, acetonitrile, methanol, and methanesulfonic acid (490:310:200:2). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Dissolve an accurately weighed quantity of USP Perphenazine RS in methanol, and dilute quantitatively with methanol to obtain a solution having a known concentration of about 0.8 mg per mL (*Solution P*). Transfer 4J mg of USP Amitriptyline Hydrochloride RS to a 50-mL volumetric flask, J being the ratio of the labeled amount, in mg, of amitriptyline hydrochloride to the labeled amount, in mg, of perphenazine per Tablet. Add 5.0 mL of *Solution P* and 20 mL of 0.2 N acetic acid, shake, and sonicate to dissolve the USP Reference Standards. Dilute with methanol to volume, and mix. Pipet 25 mL of this solution into a 100-mL volumetric flask, dilute with a mixture of methanol and 0.04 N acetic acid (3:2) to volume, and mix to obtain a *Standard preparation* having known concentrations of about 20 µg of USP Perphenazine RS per mL and about 20J µg of USP Amitriptyline Hydrochloride RS per mL.

Assay preparation—Transfer 10 Tablets to a 250-mL volumetric flask, add 100 mL of 0.2 N acetic acid, and shake the mixture until the Tablets have disintegrated. Add methanol to volume, mix, and filter. Dilute an accurately measured volume (V_F mL) of the clear filtrate quantitatively with a mixture of methanol and 0.04 N acetic acid (3:2) to obtain a solution (V_A mL) containing about 20 µg of perphenazine per mL, and filter through a membrane filter.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1 mL per minute, and is adjusted until the relative retention times for perphenazine and amitriptyline are about 1 and 1.5, respectively. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 2.0% for replicate injections, and the resolution, R , between perphenazine and amitriptyline is not less than 4.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of perphenazine ($C_{21}H_{26}ClN_3OS$) in each Tablet taken by the formula:

$$0.25(C/10)(V_A/V_F)(r_U/r_S)$$

in which C is the concentration, in µg per mL, of USP Perphenazine RS in the *Standard preparation*, V_A is the volume, in mL, of the *Assay preparation*, V_F is the volume, in mL, of the filtrate taken for the *Assay preparation*, and r_U and r_S are

the responses of the perphenazine peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the quantity, in mg, of amitriptyline hydrochloride ($C_{20}H_{23}N \cdot HCl$) taken by the same formula, reading amitriptyline hydrochloride instead of perphenazine.

Pertussis Immune Globulin

» Pertussis Immune Globulin conforms to the regulations of the FDA concerning biologics (see *Biologics* (1041)). It is a sterile, nonpyrogenic solution of globulins derived from the blood plasma of adult human donors who have been immunized with pertussis vaccine such that each 1.25 mL contains not less than the amount of immune globulin to be equivalent to 25 mL of human hyperimmune serum. It may contain 0.3 M glycine as a stabilizing agent, and it contains a suitable preservative.

Packaging and storage—Preserve at a temperature between 2° and 8°.

Expiration date—The expiration date is not later than 3 years after date of issue from manufacturer's cold storage (5°, 3 years).

Labeling—Label it to state that it is not intended for intravenous injection.

Petrolatum**DEFINITION**

Petrolatum is a purified mixture of semisolid hydrocarbons obtained from petroleum. It may contain a suitable stabilizer.

IMPURITIES**Inorganic Impurities**• **RESIDUE ON IGNITION** (281)

Sample: 2 g

Analysis: Heat the *Sample* in an open porcelain or platinum dish over a Bunsen flame.

Acceptance criteria: It volatilizes without emitting an acrid odor and yields NMT 0.1% of residue.

Organic Impurities• **PROCEDURE: ORGANIC ACIDS**

Sample solution: 20.0 g of Petrolatum in 100 mL of a 1 in 2 mixture of neutralized alcohol and water. Agitate thoroughly, and heat to boiling.

Analysis: Add 1 mL of phenolphthalein TS, and titrate rapidly with 0.1 N sodium hydroxide VS, with vigorous agitation to the production of a sharp pink endpoint, noting the color change in the alcohol-water layer.

Acceptance criteria: NMT 400 µL of 0.1 N sodium hydroxide is required.

SPECIFIC TESTS• **COLOR**

Standard solution: Ferric chloride CS and cobaltous chloride CS (3.8:1.2)

Sample: 10 g

Analysis: Melt the *Sample* on a steam bath, and pour 5 mL of the liquid into a clear-glass 15-mm × 150-mm test tube, keeping the petrolatum melted.

Acceptance criteria: The warm, melted liquid is not darker than 5 mL of the *Standard solution* in a similar tube; the comparison of the two being made in re-

flected light against a white background, and the petrolatum tube being held directly against the background at such an angle that there is no fluorescence.

- **SPECIFIC GRAVITY** (841): 0.815–0.880 at 60°
- **MELTING RANGE OR TEMPERATURE**, Class III (741): 38°–60°
- **CONSISTENCY**

Apparatus: A penetrometer fitted with a polished cone-shaped metal plunger weighing 150 g, having a detachable steel tip of the following dimensions: the tip of the cone has an angle of 30°, the point of the tip is truncated to a diameter of 0.381 ± 0.025 mm, the base of the tip is 8.38 ± 0.05 mm in diameter, and the length of the tip is 14.94 ± 0.05 mm.

The remaining portion of the cone has an angle of 90°, is 28 mm in height, and has a maximum diameter at the base of 65 mm. The containers for the test are flat-bottom metal cylinders that are 100 ± 6 mm in diameter and NLT 65 mm in height. They are constructed of at least 1.6-mm (16-gauge) metal, and are provided with well-fitting, water-tight covers.

Sample: Petrolatum

Analysis: Place the required number of containers in an oven, bring them and a quantity of the *Sample* to a temperature of $82 \pm 2.5^\circ$, and pour the *Sample* into one or more of the containers, filling to within 6 mm of the rim. Cool to $25 \pm 2.5^\circ$ over a period of NLT 16 h, protected from drafts. Two h before the test, place the containers in a water bath at $25 \pm 0.5^\circ$. If the room temperature is below 23.5° or above 26.5° , adjust the temperature of the cone to $25 \pm 0.5^\circ$ by placing it in the water bath.

Without disturbing the surface of the substance under test, place the container on the penetrometer table, and lower the cone until the tip just touches the top surface of the test substance at a spot 25–38 mm from the edge of the container. Adjust the zero setting and quickly release the plunger, then hold it free for 5 s. Secure the plunger, and read the total penetration from the scale. Make three or more trials, each so spaced that there is no overlapping of the areas of penetration. Where the penetration exceeds 20 mm, use a separate container of the test substance for each trial. Read the penetration to the nearest 0.1 mm. Calculate the average of the three or more readings, and conduct further trials to a total of 10 if the individual results differ from the average by more than $\pm 3\%$.

Acceptance criteria: The final average of the trials is NLT 10.0 mm and NMT 30.0 mm, indicating a consistency value of 100–300.

• ALKALINITY

Sample: 35 g

Analysis: Introduce the *Sample* into a suitable beaker, add 100 mL of boiling water, cover, and place on a stirring hot-plate maintained at the boiling point of water. After 5 min, allow the phases to separate. Draw off the separated water into a casserole, wash the petrolatum further with two 50-mL portions of boiling water, and add the washings to the casserole. To the pooled washings, add 1 drop of phenolphthalein TS, and boil.

Acceptance criteria: The solution does not acquire a pink color.

- **ACIDITY:** If the addition of phenolphthalein TS in the test for Alkalinity produces no pink color, add 0.1 mL of methyl orange TS.

Acceptance criteria: No red or pink color is produced.

• FIXED OILS, FATS, AND ROSIN

Sample: 10 g

Analysis: Digest the *Sample* with 50 mL of 5 N sodium hydroxide at 100° for 30 min. Separate the water layer, and acidify it with 5 N sulfuric acid.

Acceptance criteria: No oily or solid matter separates.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** Label it to indicate the name and proportion of any added stabilizer.

Hydrophilic Petrolatum

DEFINITION

Prepare Hydrophilic Petrolatum as follows.

Cholesterol	30 g
Stearyl Alcohol	30 g
White Wax	80 g
White Petrolatum	860 g
To make	1000 g

Melt the *Stearyl Alcohol* and *White Wax* together on a steam bath, then add the *Cholesterol*, and stir until completely dissolved. Add the *White Petrolatum*, and mix. Remove from the bath, and stir until the mixture congeals.

White Petrolatum

DEFINITION

White Petrolatum is a purified mixture of semisolid hydrocarbons obtained from petroleum, and wholly or nearly decolorized. It may contain a suitable stabilizer.

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION** (281)

Sample: 2 g

Analysis: Heat the *Sample* in an open porcelain or platinum dish over a flame.

Acceptance criteria: It volatilizes without emitting an acrid odor and yields NMT 0.05% of residue.

Organic Impurities

- **PROCEDURE: ORGANIC ACIDS**

Sample solution: 20.0 g of White Petrolatum in 100 mL of a 1 in 2 mixture of neutralized alcohol and water. Agitate thoroughly and heat to boiling.

Analysis: Add 1 mL of phenolphthalein TS, and titrate rapidly with 0.1 N sodium hydroxide VS, with vigorous agitation to the production of a sharp pink endpoint, noting the color change in the alcohol–water layer.

Acceptance criteria: NMT 400 μ L of 0.1 N sodium hydroxide is required.

SPECIFIC TESTS

• COLOR

Standard solution: Ferric chloride CS and water (1.6:3.4)

Sample: 10 g

Analysis: Melt the *Sample* on a steam bath, and pour 5 mL of the liquid into a clear-glass 16-mm \times 150-mm bacteriological test tube, keeping the petrolatum melted.

Acceptance criteria: The warm, melted liquid is not darker than 5 mL of the *Standard solution* in a similar tube; the comparison of the two being made in reflected light against a white background, and the petrolatum tube being held directly against the background at such an angle that there is no fluorescence.

- **SPECIFIC GRAVITY (841):** 0.815–0.880 at 60°

To the pooled washings, add 1 drop of phenolphthalein TS, and boil.

Acceptance criteria: The solution does not acquire a pink color.

- **ACIDITY**

Sample: Final solution of the test for *Alkalinity*, if the addition of phenolphthalein TS produced no pink color

Analysis: To the *Sample*, add 0.1 mL of methyl orange TS.

Acceptance criteria: No red or pink color is produced.

- **FIXED OILS, FATS, AND ROSIN**

Sample: 10 g

Analysis: Digest the *Sample* with 50 mL of 5 N sodium hydroxide at 100° for 30 min. Separate the water layer, and acidify it with 5 N sulfuric acid.

Acceptance criteria: No oily or solid matter separates.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

- **LABELING:** Label it to indicate the name and proportion of any added stabilizer.

Phenazopyridine Hydrochloride

$C_{11}H_{11}N_5 \cdot HCl$ 249.70
2,6-Pyridinediamine, 3-(phenylazo)-, monohydrochloride;
2,6-Diamino-3-(phenylazo)pyridine monohydrochloride
[136-40-3].

DEFINITION

Phenazopyridine Hydrochloride contains NLT 99.0% and NMT 101.0% of phenazopyridine hydrochloride ($C_{11}H_{11}N_5 \cdot HCl$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**

- **B. ULTRAVIOLET ABSORPTION (197U)**

Medium: Sulfuric acid in alcohol (1 in 360)

Sample solution: 5 µg/mL

Acceptance criteria: Meets the requirements

- **C.**

Standard solution: 0.02 mg/mL of USP Phenazopyridine Hydrochloride RS in the same medium as that in the *Sample solution*

Sample stock solution: 0.2 mg/mL of Phenazopyridine Hydrochloride in alcohol

Sample solution: Dilute the *Sample stock solution* with chloroform to obtain a solution with known concentration at 0.02 mg/mL.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Adsorbent: 0.25-mm layer of chromatographic silica gel

Application volume: 10 µL

Developing solvent system: Chloroform, ethyl acetate, and methanol (85:10:5)

Spray reagent: 2 N hydrochloric acid

Analysis

Samples: *Standard solution* and *Sample solution*

Develop in *Developing solvent system*. Locate the spots by spraying the plate lightly with *Spray reagent*.

Acceptance criteria: The R_f value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*.

ASSAY

- **PROCEDURE**

Standard solution: 5 µg/mL of USP Phenazopyridine Hydrochloride RS in the same medium as that in the *Sample solution*

Sample solution: Transfer about 100 mg of Phenazopyridine Hydrochloride to a 200-mL volumetric flask. Add about 100 mL of a mixture of sulfuric acid and alcohol (1 in 360), heat gently on a steam bath for 10 min, shake by mechanical means to dissolve, cool to room temperature, and dilute with alcoholic sulfuric acid to volume. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with alcoholic sulfuric acid to volume, and mix. Transfer 5.0 mL of the resulting solution to a 50-mL volumetric flask, dilute with alcoholic sulfuric acid to volume, and mix.

Instrumental conditions

Analytical wavelength: 390 nm (maximum absorbance)

Cell: 1 cm

Blank: Dilute alcoholic sulfuric acid (1 in 360)

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of phenazopyridine hydrochloride ($C_{11}H_{11}N_5 \cdot HCl$) in the portion of Phenazopyridine Hydrochloride taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Phenazopyridine Hydrochloride RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = concentration of the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 99.0%–101.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.2%

- **WATER-INSOLUBLE SUBSTANCES**

Sample: 2 g

Analysis: Dissolve the *Sample* in 200 mL of water, heat to boiling, then heat in a covered container on a steam bath for 1 h. Filter through a tared, fine-porosity, sintered-glass crucible, wash thoroughly with water, and dry at 105° to constant weight.

Acceptance criteria: The weight of the residue does not exceed 0.1% of the weight of Phenazopyridine Hydrochloride taken.

Delete the following:

- **HEAVY METALS, Method II** (231): NMT 20 ppm (Official 1: Jan-2018)

- **ORDINARY IMPURITIES** (466)

Standard solutions: 0.04, 0.02, and 0.01 mg/mL of USP Phenazopyridine Hydrochloride RS in alcohol

Sample solution: 2.0 mg/mL in alcohol

Eluent: Chloroform, ethyl acetate, and methanol (85:10:5)

Visualization: Spray the plate with 5 N hydrochloric acid.

Acceptance criteria: Meets the requirements

SPECIFIC TESTS

- **LOSS ON DRYING** (731)

Analysis: Dry at 105° for 4 h.

Acceptance criteria: NMT 1.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

- **USP REFERENCE STANDARDS** (11)

USP Phenazopyridine Hydrochloride RS

Phenazopyridine Hydrochloride Tablets

DEFINITION

Phenazopyridine Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of phenazopyridine hydrochloride ($C_{11}H_{11}N_5 \cdot HCl$).

IDENTIFICATION

- **A.**

Analysis: Transfer a quantity of finely ground Tablets, nominally equivalent to 50 mg of phenazopyridine hydrochloride, to a 125-mL separator, add 50 mL of water, 1 mL of 1 N hydrochloric acid, and 5 mL of a saturated sodium chloride solution, and shake to dissolve. Extract with two 25-mL portions of chloroform, and discard the chloroform. Add 5 mL of 1 N sodium

hydroxide to the aqueous solution, and extract with one 50-mL portion of chloroform. Transfer the chloroform layer to a second 125-mL separator, and wash with one 50-mL portion of 0.1 N sodium hydroxide. Filter the chloroform layer through a pledget of cotton previously washed with chloroform. Add 5 drops of hydrochloric acid to the filtrate, and evaporate on a steam bath under a current of air to dryness. Add 5 mL of alcohol, and evaporate. Dry the residue at 105° for 4 h.

Acceptance criteria: The IR absorption spectrum of a potassium bromide dispersion of the dried residue exhibits maxima only at the same wavelengths as that of a similar preparation of USP Phenazopyridine Hydrochloride RS.

ASSAY

- **PROCEDURE**

Buffer: 2.64 g of dibasic ammonium phosphate in 900 mL of water. Adjust with phosphoric acid to a pH of 3.0, dilute with water to 1000 mL, and mix.

Mobile phase: Methanol and *Buffer* (500:500)

Standard solution: 0.5 mg/mL of USP Phenazopyridine Hydrochloride RS. Initially add 50% final volume of methanol, and swirl to dissolve. Dilute with *Buffer* to volume, and pass through a filter of 0.5- μm or finer pore size.

Sample solution: Transfer an amount nominally equivalent to 100 mg of phenazopyridine hydrochloride from finely powdered Tablets (NLT 20) to a 200-mL volumetric flask. Add 100 mL of methanol, and sonicate for 10 min. Add 75 mL of *Buffer*, and sonicate for an additional 10 min with occasional mixing. Dilute with *Buffer* to volume, and mix. Pass this solution through a filter of 0.5- μm or finer pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 3.9-mm \times 30-cm; packing L1

Flow rate: 1.5 mL/min

Injection volume: 10 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 1400 theoretical plates

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of phenazopyridine hydrochloride ($C_{11}H_{11}N_5 \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of phenazopyridine from the *Sample solution*

r_S = peak response of phenazopyridine from the *Standard solution*

C_S = concentration of USP Phenazopyridine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of phenazopyridine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **DISSOLUTION** (711)

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Time: 45 min

Detector: UV 422 nm

Standard solution: Known concentration of USP Phenazopyridine Hydrochloride RS in *Medium*

Sample solution: Filter portions of the solution under test, and suitably dilute with *Medium* to a concentration that is similar to that of the *Standard solution*.

Tolerances: NLT 75% (Q) of the labeled amount of phenazopyridine hydrochloride ($C_{11}H_{11}N_5 \cdot HCl$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS (11)**
USP Phenazopyridine Hydrochloride RS

Phendimetrazine Tartrate

$C_{12}H_{17}NO \cdot C_4H_6O_6$ 341.36
Morpholine, 3,4-dimethyl-2-phenyl-, (2*S*-*trans*)-, [*R*-(*R**,*R**)]-2,3-dihydroxybutanedioate (1:1);
(2*S*,3*S*)-3,4-Dimethyl-2-phenylmorpholine L-(+)-tartrate (1:1) [50-58-8].

DEFINITION

Phendimetrazine Tartrate contains NLT 98.0% and NMT 102.0% of phendimetrazine tartrate ($C_{12}H_{17}NO \cdot C_4H_6O_6$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**
- **B. ULTRAVIOLET ABSORPTION (197U)**
Sample solution: 1 mg/mL in methanol
Acceptance criteria: Meets the requirements
- **C. IDENTIFICATION TESTS—GENERAL, Tartrate (191)**

ASSAY

• PROCEDURE

Sample solution: Transfer an accurately weighed amount of 500 mg of Phendimetrazine Tartrate to a suitable beaker, and dissolve in 50 mL of glacial acetic acid.

Analysis: Add 1 drop of crystal violet TS to the *Sample solution*, and titrate with 0.1 N perchloric acid VS to a green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 34.14 mg of phendimetrazine tartrate ($C_{12}H_{17}NO \cdot C_4H_6O_6$).

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION (281):** NMT 0.1%
- **CHLORIDE AND SULFATE, Chloride (221)**
Sample: 1.0 g
Acceptance criteria: 0.035%; the *Sample* shows no more chloride than corresponds to 0.50 mL of 0.020 N hydrochloric acid.
- **CHLORIDE AND SULFATE, Sulfate (221)**
Sample: 1.0 g
Acceptance criteria: 0.01%; the *Sample* shows no more sulfate than corresponds to 0.10 mL of 0.020 N sulfuric acid.

Delete the following:

- **HEAVY METALS (231):** NMT 10 ppm (Official 1-Jan-2018)

• ORGANIC IMPURITIES

Standard solution: An aqueous solution containing 100 mg/mL of USP Phendimetrazine Tartrate RS

Sample solution: 100 mg/mL of Phendimetrazine Tartrate in water

Chromatographic system

(See Chromatography (621), Thin-Layer Chromatography.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 10 μ L

Developing solvent system: Acetone, methanol, and ammonium hydroxide (50:50:1)

Analysis

Develop the chromatogram in a suitable chamber with the *Developing solvent system* until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, air-dry, view under short-wavelength UV light, and observe the location of the spots. Expose the plate to iodine vapors in a closed chamber.

Acceptance criteria: Yellow spots appear at the same locations as the spots observed under UV light, and the R_f value of the spot of the *Sample solution* corresponds to that of the *Standard solution*, and no other spot is obtained.

• L-Erythro ISOMER

Sample solution: Dissolve 3.0 g of Phendimetrazine Tartrate in 25 mL of sodium hydroxide solution (1 in 20) in a suitable separator. Add 25 mL of sodium hydroxide solution (1 in 2), swirl, and allow the phendimetrazine base to separate. Discard the lower, alkaline layer, and collect the upper layer, centrifuging, if necessary, to obtain a clear liquid.

Chromatographic system

Mode: GC

Analysis

Sample: *Sample solution*

[NOTE—The retention times for the *D-threo* isomer and the *L-erythro* isomer are about 8.5 and 9 min, respectively.]

Preferably using an electronic integrator, determine the areas of all peaks in the chromatogram.

Calculate the percentage of the *L-erythro* isomer in the *Sample solution* taken:

$$\text{Result} = (r_u/r_T) \times 100$$

r_u = peak area of the *L-erythro* isomer peak

r_T = sum of the areas of the *L-erythro* isomer peak and the *D-threo* isomer peak

Acceptance criteria: NMT 0.1%

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE (741):** 182°–188°, with decomposition, but the range between beginning and end of melting does not exceed 3°.

- **OPTICAL ROTATION, Specific Rotation (781S)**

Sample solution: 100 mg/mL in water

Acceptance criteria: +32° to +36°

- **PH (791):** 3.0–4.0, in a solution (1 in 40)

- **LOSS ON DRYING (731)**

Analysis: Dry to constant weight at 105°.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

- **USP REFERENCE STANDARDS (11)**

USP Phendimetrazine Tartrate RS

Phendimetrazine Tartrate Capsules

DEFINITION

Phendimetrazine Tartrate Capsules contain NLT 95.0% and NMT 105.0% of the labeled amount of phendimetrazine tartrate ($C_{12}H_{17}NO \cdot C_4H_6O_6$).

IDENTIFICATION

- **A.**

Analysis: Shake a quantity of Capsule contents, nominally equivalent to 300 mg of phendimetrazine tartrate, with 50 mL of water. Filter, and transfer the filtrate to a 200-mL separator. Add 3 mL of 12.5 N sodium hydroxide, and extract with two 50-mL portions of chloroform. Extract the combined chloroform extracts in a 250-mL separator with two 15-mL portions of 0.5 N hydrochloric acid, and evaporate the combined aqueous extracts on a steam bath to dryness. Dissolve the residue in 5 mL of acetone, and add 50 mL of anhydrous ether to the solution. On standing, phendimetrazine hydrochloride crystallizes out. Filter the precipitate, wash with anhydrous ether, and dry at 105°.

Acceptance criteria: The phendimetrazine hydrochloride crystals so obtained melt at 189°–193°, but the range between the beginning and end of melting does not exceed 2°.

- **B. IDENTIFICATION TESTS—GENERAL, Tartrate (191)**

ASSAY

- **PROCEDURE**

Mobile phase: Dissolve 1.1 g of sodium 1-heptanesulfonate in 575 mL of water, add 400 mL of methanol and 25 mL of dilute acetic acid (14 in 100), and mix. Adjust with glacial acetic acid to a pH of 3.0 ± 0.1 , if necessary. Pass through a membrane filter of 0.45- μ m pore size, and degas.

Diluent: Dilute acetic acid (14 in 100), methanol, and water (2.5:40:57.5)

Internal standard solution: 0.1 mg/mL of salicylamide in Diluent

Standard solution: 0.7 mg/mL of USP Phendimetrazine Tartrate RS in Internal standard solution

Sample solution: Remove, as completely as possible, the contents of NLT 20 Capsules, and weigh accurately. Mix the combined contents, and transfer an accurately weighed quantity of the powder, equivalent to 35 mg of phendimetrazine tartrate, to a 50-mL volumetric flask. Add 25 mL of Internal standard solution, and sonicate for 15 min. Cool the solution to room temperature, dilute with Internal standard solution to volume, mix, and filter through a membrane filter of 0.45- μ m pore size.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 256 nm

Column: 3.9-mm \times 30-cm; packing L1

Flow rate: 1 mL/min

Injection volume: 20 μ L

System suitability

Sample: Standard solution

[NOTE—The relative retention times for salicylamide and phendimetrazine tartrate are 0.5 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 3.0 between the analyte and internal standard peaks

Relative standard deviation: NMT 1.0%

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of phendimetrazine tartrate ($C_{12}H_{17}NO \cdot C_4H_6O_6$) in the portion of Capsules taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of phendimetrazine tartrate to the internal standard from the Sample solution

R_S = peak response ratio of phendimetrazine tartrate to the internal standard from the Standard solution

C_S = concentration of USP Phendimetrazine Tartrate RS in the Standard solution (mg/mL)

C_U = nominal concentration of phendimetrazine tartrate in the Sample solution (mg/mL)

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS

- **DISSOLUTION (711)**

Medium: Water; 900 mL

Apparatus 1: 100 rpm

Time: 60 min

Solution A: 0.025 M monobasic potassium phosphate solution. Adjust with 1 N potassium hydroxide to a pH of 7.5.

Mobile phase: Acetonitrile and Solution A (65:35). Filter, and degas.

Standard solution: A known concentration of USP Phendimetrazine Tartrate RS, similarly prepared as the Sample solution

Sample solution: Filter a portion of the solution under test.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 210 nm

USP Phendimetrazine Tartrate RS

Phenelzine Sulfate

$C_8H_{12}N_2 \cdot H_2SO_4$ 234.27

Hydrazine, (2-phenylethyl)-, sulfate (1:1).

Phenethylhydrazine sulfate (1:1). [156-51-4].

» Phenelzine Sulfate contains not less than 98.0 percent and not more than 102.0 percent of $C_8H_{12}N_2 \cdot H_2SO_4$, calculated on the dried basis.

Packaging and storage—Preserve in tight containers, protected from heat and light.

USP Reference standards (11)—

USP Phenelzine Sulfate RS

Identification—

A: *Infrared Absorption* (197K).

B: Dissolve 100 mg in 5 mL of water, render the solution alkaline with 1 N sodium hydroxide, and add 1 mL of alkaline cupric tartrate TS: a red to yellow-red precipitate is formed.

C: A solution (1 in 10) meets the requirements of the tests for Sulfate (191).

Melting range (741): between 164° and 168°.

pH (791): between 1.4 and 1.9, in a solution (1 in 100).

Loss on drying (731)—Dry it at a pressure not exceeding 5 mm of mercury over silica gel at 80° for 2 hours: it loses not more than 1.0% of its weight.

Delete the following:

• **Heavy metals, Method I** (231): 0.002%. (Official 1-Jan-2018)

Limit of hydrazine—

Mobile phase—Prepare a filtered and degassed mixture of methanol and 1% monobasic ammonium phosphate solution (75:25). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard solution—Transfer an accurately weighed quantity of about 42.0 mg of hydrazine sulfate, equivalent to about 10 mg of hydrazine, to a 100-mL volumetric flask. Dissolve in water, sonicate for about 5 minutes, dilute with methanol to volume, and mix. Dilute an accurately measured volume of this solution quantitatively and stepwise with methanol to obtain a solution having a known concentration of 5.0 µg of hydrazine per mL. Transfer 5.0 mL of this solution to a 200-mL volumetric flask, add 50 mL of methanol and 0.7 mL of ammonium hydroxide, and shake to mix. Add 0.5 mL of salicylaldehyde, shake by mechanical means for about 5 minutes, dilute with methanol to volume, sonicate for about 2 minutes, and mix.

Test solution—Transfer about 25.8 mg of Phenelzine Sulfate, accurately weighed, to a 200-mL volumetric flask, dissolve in about 50 mL of methanol, and sonicate. Add 0.7 mL of ammonium hydroxide, shake to mix, add 0.5 mL of salicylaldehyde, shake by mechanical means for about 5 minutes, dilute with methanol to volume, sonicate for about 2 minutes, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 340-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. Chromatograph the *Standard solution*, and record the peak areas as directed for *Procedure*: the relative retention times for salicylaldehyde, phenelzine sulfate derivative, and hydrazine sulfate derivative are about 0.21, 0.47, and 1.0, respectively; the column efficiency determined from the analyte peak is not less than 4500 theoretical plates; the resolution, *R*, between phenelzine and salazine (derivatized hydrazine) is not less than 1.25; and the relative standard deviation for replicate injections is not more than 7%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas for salazine (derivatized hydrazine). Calculate the

percentage of hydrazine in the portion of Phenelzine Sulfate taken by the formula:

$$20(C/W)(r_U / r_S)$$

in which *C* is the concentration, in µg per mL, of hydrazine base in the *Standard solution*; *W* is the weight, in mg, of Phenelzine Sulfate taken to prepare the *Test solution*; and *r_U* and *r_S* are the salazine peak areas obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.1% is found.

Ordinary impurities (466)—

Test solution: a mixture of methanol and water (1:1).

Standard solution: a mixture of methanol and water (1:1).

Eluant: acetone. [NOTE—Prewash the plate with *Eluant*, and dry.]

Visualization: 1.

Assay—

Ion-pair solution, Mobile phase, Standard preparation, and Chromatographic system—Proceed as directed in the *Assay* under *Phenelzine Sulfate Tablets*.

Assay preparation—Transfer about 26 mg of Phenelzine Sulfate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of $C_8H_{12}N_2 \cdot H_2SO_4$ in the portion of Phenelzine Sulfate taken by the formula:

$$100C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Phenelzine Sulfate RS in the *Standard preparation*; and *r_U* and *r_S* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Phenelzine Sulfate Tablets

» Phenelzine Sulfate Tablets contain an amount of phenelzine sulfate ($C_8H_{12}N_2 \cdot H_2SO_4$) equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of phenelzine ($C_8H_{12}N_2$).

Packaging and storage—Preserve in tight containers, protected from heat and light.

USP Reference standards (11)—

USP Phenelzine Sulfate RS

Identification—Extract a portion of powdered Tablets, equivalent to about 30 mg of phenelzine, with 10 mL of water, and filter: the filtrate responds to *Identification* tests B and C under *Phenelzine Sulfate*.

Disintegration (701)—Place 1 tablet in each of the 6 tubes of the basket and, if the tablets have a soluble external coating, immerse the basket in water at room temperature for 5 minutes. Then add a disk to each tube, and operate the apparatus, using simulated gastric fluid TS maintained at 37 ± 2° as the immersion fluid. After 30 minutes of operation in simulated gastric fluid TS, lift the basket from the fluid, and observe the tablets. If the tablets have not disintegrated completely, substitute simulated intestinal fluid TS maintained at 37 ± 2° as the immersion fluid. Continue the test for a total period of time, including previous exposure to water and simulated gastric fluid TS, of 1 hour and 30 minutes. Lift the basket from the fluid, and observe

the tablets: all of the tablets have disintegrated completely. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets: not less than 16 of the total 18 tablets tested disintegrate completely.

Uniformity of dosage units (905): meet the requirements.

Assay—

Ion-pair solution—Dissolve about 6.8 g of monobasic potassium phosphate and about 2.16 g of sodium 1-octanesulfonate in 1000 mL of water, and mix. Adjust with phosphoric acid to a pH of 3.0, and filter.

Mobile phase—Prepare a filtered and degassed mixture of *ion-pair solution* and methanol (60:40). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Dissolve an accurately weighed quantity of USP Phenelzine Sulfate RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 258 µg per mL.

Assay preparation—Transfer not less than 20 Tablets to a suitable container, add about 300 mL of *Mobile phase*, and homogenize until dissolved. Transfer this solution to a 500-mL volumetric flask, dilute with *Mobile phase* to volume, mix, centrifuge, and filter, discarding the first 5 mL of the filtrate. Transfer a portion of the filtrate, equivalent to about 12.9 mg of phenelzine sulfate, to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 210-nm detector and a 3.9-mm × 15-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in µg, of phenelzine (C₈H₁₂N₂) in the *Assay preparation* by the formula:

$$(136.20 / 234.27)(50C)(r_U / r_S)$$

in which 136.20 and 234.27 are the molecular weights of phenelzine and phenelzine sulfate, respectively, C is the concentration, in µg per mL, of USP Phenelzine Sulfate RS in the *Standard preparation*, and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Pheniramine Maleate

C₁₆H₂₀N₂ · C₄H₄O₄ 356.42

2-[α-[2-Dimethylaminoethyl]benzyl]pyridine bimalate.

N,N-Dimethyl-3-phenyl-3-(2-pyridyl)propylamine hydrogen maleate [132-20-7].

» Pheniramine Maleate contains not less than 98.0 percent and not more than 102.0 percent of C₁₆H₂₀N₂ · C₄H₄O₄, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Pheniramine Maleate RS

Identification, Infrared Absorption (197K).

Melting range, Class I (741): between 104° and 109°.

pH (791): between 4.5 and 5.5, in a solution (10 mg per mL).

Loss on drying (731)—Dry it in vacuum at 65° for 6 hours: it loses not more than 0.5% of its weight.

Residue on ignition (281): not more than 0.5%.

Delete the following:

• **Heavy metals, Method I** (231): 0.002%. • (Official 1-Jan-2018)

Chromatographic purity—

0.005 M Octane sulfonic acid—Transfer 1.08 g of sodium 1-octane sulfonate to a 1-liter volumetric flask. Dilute with 1.5% (v/v) acetic acid solution to volume, add 5.0 mL of triethylamine, mix, and filter.

Mobile phase—Prepare a filtered and degassed mixture of 0.005 M Octane sulfonic acid and acetonitrile (39:11). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

System suitability solution—Dissolve suitable quantities of phenylethyl alcohol and USP Pheniramine Maleate RS in water to obtain a solution containing about 3.6 and 0.24 mg per mL, respectively.

Test solution—Transfer about 24 mg of Pheniramine Maleate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 265-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.5 phenylethyl alcohol and 1.0 for pheniramine maleate, and the resolution, R , between phenylethyl alcohol and pheniramine maleate is not less than 2.0, the tailing factor is not more than 2.5, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Inject a volume (about 10 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity (not including the solvent peak and maleic acid, if observed) in the portion of Pheniramine Maleate taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response for each impurity, and r_s is the sum of the responses of all of the peaks: not more than 0.5% of any individual impurity is found, and not more than 2.0% of total impurities is found.

Assay—Dissolve about 500 mg of Pheniramine Maleate, accurately weighed, in 25 mL of glacial acetic acid. Add 2 drops of crystal violet TS, and titrate with 0.1 N perchloric acid VS. Perform a blank determination, and make any necessary corrections. Each mL of 0.1 N perchloric acid is equivalent to 17.82 mg of C₁₆H₂₀N₂ · C₄H₄O₄.

Phenmetrazine Hydrochloride

$C_{11}H_{15}NO \cdot HCl$ 213.70
Morpholine, 3-methyl-2-phenyl-, hydrochloride;
3-Methyl-2-phenylmorpholine hydrochloride [1707-14-8].

DEFINITION

Phenmetrazine Hydrochloride, dried at 105° for 2 h, contains NLT 98.0% and NMT 102.0% of phenmetrazine hydrochloride ($C_{11}H_{15}NO \cdot HCl$).

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197S)
Medium: Chloroform
Solution: 1 in 20
Acceptance criteria: Meets the requirements
- **B. ULTRAVIOLET ABSORPTION** (197U)
Medium: 0.5 N hydrochloric acid
Solution: 500 µg/mL
Acceptance criteria: Meets the requirements

ASSAY

- **PROCEDURE**
Diluent: 0.5 N hydrochloric acid
Standard solution: 0.5 mg/mL of USP Phenmetrazine Hydrochloride RS in Diluent
Sample solution: 0.5 mg/mL of previously dried Phenmetrazine Hydrochloride in Diluent

Instrumental conditions

Mode: UV
Analytical wavelength: Maximum absorbance at about 256 nm
Cell: 1 cm
Blank: 0.5 N hydrochloric acid

Analysis

Samples: Standard solution and Sample solution
Calculate the percentage of phenmetrazine hydrochloride ($C_{11}H_{15}NO \cdot HCl$) in the portion of Phenmetrazine Hydrochloride taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

- A_U = absorbance of the Sample solution
 A_S = absorbance of the Standard solution
 C_S = concentration of USP Phenmetrazine Hydrochloride RS in the Standard solution (mg/mL)
 C_U = concentration of Phenmetrazine Hydrochloride in the Sample solution (mg/mL)

Acceptance criteria: 98.0%–102.0% on sample dried at 105° for 2 h

OTHER COMPONENTS

• CONTENT OF CHLORIDE

Sample solution: Transfer about 350 mg, previously dried, to a 250-mL beaker. Add about 125 mL of water and 10 drops of sulfuric acid, and stir for 15 min with a magnetic stirrer.

Analysis: Titrate the solution potentiometrically with 0.1 N silver nitrate VS, using a silver–mercurous sulfate electrode system with a saturated salt bridge of potassium sulfate. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of Cl.

Acceptance criteria: 16.3%–17.0%

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%
- **CHLORIDE AND SULFATE, Sulfate** (221)
Sample: 2.0 g
Acceptance criteria: The Sample shows no more sulfate than corresponds to 0.20 mL of 0.020 N sulfuric acid (0.01%).

USP Phenmetrazine Hydrochloride RS

Phenmetrazine Hydrochloride Tablets

DEFINITION

Phenmetrazine Hydrochloride Tablets contain NLT 93.0% and NMT 107.0% of the labeled amount of phenmetrazine hydrochloride ($C_{11}H_{15}NO \cdot HCl$).

IDENTIFICATION

- **A.**
Analysis: Dissolve 5 Tablets in 40 mL of water in a 250-mL separator. Add 3 mL of sodium hydroxide solution (1 in 2), and extract with two 50-mL portions of chloroform. Extract the combined chloroform extracts in a 250-mL separator with two 15-mL portions of 0.5 N hydrochloric acid, and evaporate the combined aqueous extracts on a steam bath to dryness. Dissolve the residue in 5 mL of acetone, and add 50 mL of anhydrous ether to the solution. On standing, phenmetrazine hydrochloride will crystallize out. Filter the precipitate, wash with anhydrous ether, and dry at 105°.
Acceptance criteria: The crystals so obtained melt within a range of 3° between 172° and 182° (see *Melting Range or Temperature* (741)).

Transfer a portion of the powder, nominally equivalent to 250 mg of phenmetrazine hydrochloride, to a 250-mL volumetric flask, add 125 mL of Diluent, shake by mechanical means for 1 h, and dilute with Diluent to volume. Transfer 50.0 mL of the solution to a 250-mL separator, add 5 mL of sodium hydroxide solu-

tion (1 in 2), and extract with four 50-mL portions of chloroform, collecting the chloroform extracts in a second 250-mL separator. Extract the combined chloroform extracts with six 15-mL portions of *Diluent*, collecting the aqueous extracts in a 100-mL volumetric flask, and dilute with *Diluent* to volume.

Instrumental conditions

Mode: UV

Analytical wavelength: Maximum at about 256 nm

Cell: 1 cm

Blank: 0.5 N hydrochloric acid

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of phenmetrazine hydrochloride ($C_{11}H_{15}NO \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Phenmetrazine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of phenmetrazine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 93.0%–107.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Time: 45 min

Standard solution: USP Phenmetrazine Hydrochloride RS in *Medium*

Sample solution: A filtered portion of the solution under test, suitably diluted with *Medium*, if necessary, to a concentration similar to that of the *Standard solution* in the same *Medium*

Instrumental conditions

Mode: UV

Analytical wavelength: Maximum at about 256 nm

Analysis: Determine the percentage of the labeled amount of phenmetrazine hydrochloride ($C_{11}H_{15}NO \cdot HCl$) dissolved.

Tolerances: NLT 75% (Q) of the labeled amount of phenmetrazine hydrochloride ($C_{11}H_{15}NO \cdot HCl$) is dissolved.

• UNIFORMITY OF DOSAGE UNITS (905): Meet the requirements

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE: Preserve in tight containers.

• USP REFERENCE STANDARDS (11)

USP Phenmetrazine Hydrochloride RS

Phenobarbital

$C_{12}H_{12}N_2O_3$ 232.24

2,4,6-(1H,3H,5H)-Pyrimidinetrione, 5-ethyl-5-phenyl-
5-Ethyl-5-phenylbarbituric acid [50-06-6].

» Phenobarbital contains not less than 98.0 percent and not more than 101.0 percent of $C_{12}H_{12}N_2O_3$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Phenobarbital RS

Identification—

A: The IR absorption spectrum of a potassium bromide dispersion of it exhibits maxima only at the same wavelengths as that of a similar preparation of USP Phenobarbital RS. If a difference appears, dissolve portions of both the test specimen and the USP Reference Standard in a suitable solvent, evaporate the solutions to dryness, and repeat the test on the residues.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, both relative to the internal standard, as obtained in the *Assay*.

Melting range (741): between 174° and 178°, but the range between beginning and end of melting does not exceed 2°.

Loss on drying (731)—Dry it at 105° for 2 hours: it loses not more than 1.0% of its weight.

Residue on ignition (281): not more than 0.15%.

Assay—

pH 4.5 Buffer solution—Dissolve about 6.6 g of sodium acetate trihydrate and 3.0 mL of glacial acetic acid in 1000 mL of water, and adjust, if necessary, with glacial acetic acid to a pH of 4.5 ± 0.1.

Mobile phase—Prepare a filtered and degassed mixture of *pH 4.5 Buffer solution* and methanol (3:2), making adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Internal standard solution—Dissolve a sufficient quantity of caffeine in a mixture of methanol and *pH 4.5 Buffer solution* (1:1) to obtain a solution having a concentration of about 125 µg per mL.

Standard preparation—Dissolve about 20 mg of USP Phenobarbital RS, accurately weighed, in 15.0 mL of *Internal standard solution*. Sonicate if necessary.

Assay preparation—Transfer about 20 mg of Phenobarbital, accurately weighed, to a conical flask, add 15.0 mL of *Internal standard solution*, mix, and sonicate for 15 minutes. Filter through a membrane filter (0.5 µm or finer porosity) before use.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 25-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution, R , between the analyte and the internal standard peaks is not less than 1.2, the tailing factor for the analyte and the internal standard peaks is not greater than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.6 for caffeine and 1.0 for phenobarbital. Calculate the quantity, in mg, of $C_{12}H_{12}N_2O_3$ in the portion of Phenobarbital taken by the formula:

$$W(R_U/R_S)$$

in which W is the weight, in mg, of USP Phenobarbital RS taken for the *Standard preparation*, and R_U and R_S are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Phenobarbital Oral Solution

» Phenobarbital Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of phenobarbital ($C_{12}H_{12}N_2O_3$).

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Phenobarbital RS

Identification—

A: Place 10 mL of Oral Solution in a separator containing 20 mL of water, add 5 mL of 1 N sodium hydroxide, and extract with two 10-mL portions of chloroform, discarding the chloroform extracts. Add 5 mL of 3 N hydrochloric acid, and extract with two 25-mL portions of chloroform, filtering the extracts through paper into a beaker. Remove the chloroform by evaporation on a steam bath, and dry the residue at 105° for 2 hours: the residue so obtained meets the requirements for Identification test A under Phenobarbital.

B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, both relative to the internal standard, as obtained in the Assay.

Alcohol Determination, Method II (611): between 12.0% and 15.0% of C_2H_5OH .

Assay—

pH 4.5 Buffer solution, Mobile phase, and Chromatographic system—Prepare as directed in the Assay under Phenobarbital.

Diluent—Prepare a mixture of methanol and pH 4.5 Buffer solution (2:1).

Internal standard solution—Dissolve a sufficient quantity of caffeine in Diluent to obtain a solution having a concentration of about 1.7 mg per mL.

Standard preparation—Transfer about 33 mg of USP Phenobarbital RS, accurately weighed, to a 25-mL volumetric flask containing 2.0 mL of Internal standard solution. Dilute with Diluent to volume, and mix.

Assay preparation—Transfer a quantity of Oral Solution, equivalent to about 33 mg of phenobarbital, to a 25-mL volumetric flask containing 2.0 mL of Internal standard solution. Dilute with Diluent to volume, and mix.

Procedure—Proceed as directed for Procedure in the Assay under Phenobarbital. Calculate the quantity, in mg, of phenobarbital ($C_{12}H_{12}N_2O_3$) in the portion of the Oral Solution taken by the formula:

$$W(R_U / R_S)$$

in which the terms are as defined therein.

Phenobarbital Compounded Oral Suspension

DEFINITION

Phenobarbital Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of phenobarbital ($C_{12}H_{12}N_2O_3$).

Prepare Phenobarbital Compounded Oral Suspension 10 mg/mL as follows (see Pharmaceutical Compounding—Nonsterile Preparations (795)).

Phenobarbital tablets ^a equivalent to	1.2 g of phenobarbital
Vehicle: a 1:1 mixture of Ora-Sweet ^b (regular or sugar-free) and Ora-Plus, ^b a sufficient quantity to make	120 mL

^aPhenobarbital 60-mg tablets, Excellium Pharmaceutical, Inc., Fairfield, NJ.

^bPaddock Laboratories, Minneapolis, MN.

Calculate the required quantity of each ingredient for the total amount to be prepared. Place the required number of Phenobarbital tablets in a suitable mortar, and comminute to a fine powder with a pestle. Add the Vehicle in small portions, and triturate to make a smooth paste. Add increasing volumes of the Vehicle to make a phenobarbital liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the Vehicle to bring to final volume, and mix well.

ASSAY

• PROCEDURE

Mobile phase: Acetonitrile and water (30:70). Adjust with dilute sulfuric acid to a pH of 3.0.

Standard stock solution: 0.4 mg/mL of USP Phenobarbital RS in Mobile phase

Standard solution: 20 µg/mL of phenobarbital prepared from Standard stock solution and Mobile phase

Sample solution: Shake thoroughly by hand each bottle of Oral Suspension. Prepare 20 µg/mL of phenobarbital from Oral Suspension and Mobile phase, and centrifuge.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 235 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Column temperature: 60°

Flow rate: 1.0 mL/min

Injection volume: 5 µL

System suitability

Sample: Standard solution

[NOTE—The retention time for phenobarbital is about 6.8 min.]

Suitability requirements

Relative standard deviation: NMT 2.0% for replicate injections

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of phenobarbital ($C_{12}H_{12}N_2O_3$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

r_U = peak response from the Sample solution

r_S = peak response from the Standard solution

C_S = concentration of USP Phenobarbital RS in the Standard solution (µg/mL)

C_U = nominal concentration of phenobarbital in the Sample solution (µg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

• **pH (791):** 3.8–4.8

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled room temperature.

• **BEYOND-USE DATE:** NMT 115 days after the date on which it was compounded, when stored at controlled room temperature

• **LABELING:** Label it to indicate that it is to be well shaken before use, and to state the Beyond-Use Date.

- **USP REFERENCE STANDARDS** (11)
USP Phenobarbital RS

Phenobarbital Tablets

» Phenobarbital Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{12}H_{12}N_2O_3$.

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—
USP Phenobarbital RS

Identification—

A: Triturate a quantity of finely powdered Tablets, equivalent to about 60 mg of phenobarbital, with 50 mL of chloroform, and filter. Evaporate the clear filtrate to dryness, and dry at 105° for 2 hours; the residue so obtained responds to Identification test A under Phenobarbital.

B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that of the Standard preparation, both relative to the internal standard, as obtained in the Assay.

Dissolution (711)—

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Time: 45 minutes.

Procedure—Determine the amount of $C_{12}H_{12}N_2O_3$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 240 nm on filtered portions of the solution under test, suitably diluted with pH 9.6 alkaline borate buffer (see Buffer Solutions in the section Reagents, Indicators, and Solutions), in comparison with a Standard solution having a known concentration of USP Phenobarbital RS in the same Medium.

Tolerances—Not less than 75% (Q) of the labeled amount of $C_{12}H_{12}N_2O_3$ is dissolved in 45 minutes.

Uniformity of dosage units (905): meet the requirements.

Assay—

pH 4.5 Buffer solution, Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system—Prepare as directed in the Assay under Phenobarbital.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Weigh accurately a portion of the powder, equivalent to about 20 mg of phenobarbital, add 15.0 mL of Internal standard solution, mix, and sonicate for 15 minutes. Filter through a membrane filter having a 0.5- μ m or finer porosity before use.

Procedure—Proceed as directed for Procedure in the Assay under Phenobarbital. Calculate the quantity, in mg, of $C_{12}H_{12}N_2O_3$ in the portion of Tablets taken by the formula:

$$(W)(R_u / R_s)$$

in which the terms are as defined therein.

Phenobarbital Sodium

$C_{12}H_{11}N_2NaO_3$ 254.22

2,4,6-(1H,3H,5H)-Pyrimidinetrione, 5-ethyl-5-phenyl-, monosodium salt.

Sodium 5-ethyl-5-phenylbarbiturate [57-30-7].

» Phenobarbital Sodium contains not less than 98.5 percent and not more than 101.0 percent of $C_{12}H_{11}N_2NaO_3$, calculated on the dried basis.

Packaging and storage—Preserve in tight containers.

Labeling—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

USP Reference standards (11)—

USP Endotoxin RS

USP Phenobarbital RS

Completeness of solution—Mix 1.0 g with 10 mL of carbon dioxide-free water; after 1 minute, the solution is clear and free from undissolved solid.

Identification—

A: Dissolve about 50 mg of Phenobarbital Sodium in 15 mL of water in a separator, add 2 mL of hydrochloric acid, shake, and extract the liberated phenobarbital with four 25-mL portions of chloroform. Filter the combined extracts through a pledget of cotton or other suitable filter into a beaker, and wash the separator and the filter with several small portions of chloroform. Evaporate a 50-mL portion of the chloroform solution of phenobarbital on a steam bath with the aid of a current of air. Add 10 mL of ether, again evaporate, and dry the residue at 105° for 2 hours; the IR absorption spectrum of a potassium bromide dispersion of the residue so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Phenobarbital RS.

B: Ignite about 200 mg; the residue effervesces with acids, and responds to the tests for Sodium (191).

C: The relative retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

pH (791): between 9.2 and 10.2, in the solution prepared in the test for Completeness of solution.

Loss on drying (731)—Dry it at 150° for 4 hours; it loses not more than 7.0% of its weight.

Delete the following:

• **Heavy metals** (231)—Dissolve 2.0 g in 52 mL of water. Add slowly, with vigorous stirring, 8 mL of 1 N hydrochloric acid, and filter, discarding the first 5 mL of the filtrate. Dilute 20 mL of the subsequent filtrate with water to 25 mL; the limit is 0.003%. (Official 1-Jan-2018)

Other requirements—Where the label states that Phenobarbital Sodium is sterile, it meets the requirements for Sterility Tests (71) and for Bacterial endotoxins under Phenobarbital Sodium for Injection. Where the label states that Phenobarbital Sodium must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for Bacterial endotoxins under Phenobarbital Sodium for Injection.

Assay—

pH 4.5 Buffer solution, Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system—Prepare as directed in the Assay under Phenobarbital.

Assay preparation—Transfer about 22 mg of Phenobarbital Sodium, accurately weighed, to a conical flask, add 15.0 mL of Internal standard solution, mix, and sonicate for 15 minutes. Pass through a membrane filter having a 0.5- μ m or finer porosity before use.

Procedure—Proceed as directed for Procedure in the Assay under Phenobarbital. Calculate the quantity, in mg, of

$C_{12}H_{11}N_2NaO_3$ in the portion of Phenobarbital Sodium taken by the formula:

$$(254.22 / 232.24)(W)(R_U / R_S)$$

in which 254.22 and 232.24 are the molecular weights of phenobarbital sodium and phenobarbital, respectively; and the other terms are as defined therein.

Phenobarbital Sodium Injection

» Phenobarbital Sodium Injection is a sterile solution of Phenobarbital Sodium in a suitable solvent. Phenobarbital may be substituted for the equivalent amount of Phenobarbital Sodium, for adjustment of the pH. The Injection contains the equivalent of not less than 90.0 percent and not more than 105.0 percent of the labeled amount of $C_{12}H_{11}N_2NaO_3$.

Packaging and storage—Preserve in single-dose or multiple-dose containers, preferably of Type I glass.

Labeling—The label indicates that the Injection is not to be used if it contains a precipitate.

USP Reference standards (11)—

USP Endotoxin RS

USP Phenobarbital RS

Identification—

A: Transfer to a separator a volume of Injection, equivalent to about 50 mg of phenobarbital sodium, add 15 mL of water, add 2 mL of hydrochloric acid, shake, and extract the liberated phenobarbital with four 25-mL portions of chloroform. Filter the combined extracts through a pledget of cotton or other suitable filter into a beaker, and wash the separator and the filter with several small portions of chloroform. Evaporate a 50-mL portion of the chloroform solution of phenobarbital on a steam bath with the aid of a current of air. Add 10 mL of ether, again evaporate, and dry the residue at 105° for 2 hours: the IR absorption spectrum of a potassium bromide dispersion of the residue so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Phenobarbital RS.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, both relative to the internal standard, as obtained in the *Assay*.

Bacterial Endotoxins Test (85)—It contains not more than 0.3 USP Endotoxin Unit per mg of phenobarbital sodium.

pH (791): between 9.2 and 10.2.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products (1)*.

Assay—

pH 4.5 Buffer solution, Mobile phase, Internal standard solution, and Chromatographic system—Prepare as directed in the *Assay under Phenobarbital*.

Standard preparation—Transfer about 15 mg of USP Phenobarbital RS, accurately weighed, to a 50-mL volumetric flask, add 25 mL of *Mobile phase*, and sonicate if necessary to dissolve. Add 15.0 mL of *Internal standard solution*, dilute with *Mobile phase* to volume, and mix to obtain a solution having a known concentration of about 0.3 mg of USP Phenobarbital RS per mL.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 65 mg of phenobarbital sodium, to a 100-mL volumetric flask, dilute with *Mobile*

phase to volume, and mix. Transfer 25.0 mL of this solution to a 50-mL volumetric flask, add 15.0 mL of *Internal standard solution*, dilute with *Mobile phase* to volume, and mix.

Procedure—Proceed as directed for *Procedure in the Assay under Phenobarbital*. Calculate the quantity, in mg, of $C_{12}H_{11}N_2NaO_3$ in each mL of the Injection taken by the formula:

$$(254.22 / 232.24)(4W / V)(R_U / R_S)$$

in which 254.22 and 232.24 are the molecular weights of phenobarbital sodium and phenobarbital, respectively, V is the volume, in mL, of Injection taken, and the other terms are as defined therein.

Phenobarbital Sodium for Injection

» Phenobarbital Sodium for Injection is Phenobarbital Sodium suitable for parenteral use.

Change to read:

Packaging and storage—Preserve as described in *•Packaging and Storage Requirements (659)*, *Injection Packaging, Packaging for constitution* (CN 1-May-2017).

USP Reference standards (11)—

USP Endotoxin RS

USP Phenobarbital RS

Constituted solution—At the time of use, it meets the requirements for *Injections and Implanted Drug Products (1)*, *Specific Tests, Completeness and clarity of solutions*.

Bacterial Endotoxins Test (85)—It contains not more than 0.8 USP Endotoxin Unit per mg of phenobarbital sodium.

Change to read:

Other requirements—It conforms to the Definition, responds to the *Identification* tests, and meets the requirements for *Completeness of solution, pH, Loss on drying*, *• (Official 1-Jan-2018)* and *Assay under Phenobarbital Sodium*. It meets also the requirements for *Sterility Tests (71)*, *Uniformity of Dosage Units (905)*, and *Labeling (7)*, *Labels and Labeling for Injectable Products*.

Phenol

C_6H_6O

Phenol [108-95-2].

94.11

DEFINITION

Phenol contains NLT 99.0% and NMT 100.5% of phenol (C_6H_6O), calculated on the anhydrous basis. It may contain a suitable stabilizer.

IDENTIFICATION

[CAUTION—Avoid contact with skin because serious burns may result.]

- **A.**
Analysis: To a solution add bromine TS.
Acceptance criteria: A white precipitate is formed, and it dissolves at first but becomes permanent as more of the reagent is added.
- **B.**
Sample solution: 1 in 100
Analysis: To 10 mL of the *Sample solution* add 1 drop of ferric chloride TS.
Acceptance criteria: A violet color is produced.

ASSAY• **PROCEDURE**

Sample: 2 g

Titrimetric system

(See *Titrimetry* (541).)

Mode: Residual titration

Titrant: 0.1 N bromine VS

Back-titrant: 0.1 N sodium thiosulfate VS

Endpoint detection: Visual

Analysis: Place the *Sample* in a 1000-mL volumetric flask, and dilute with water to volume. Pipet 20 mL of the solution into an iodine flask, add 30.0 mL of *Titrant*, then add 5 mL of hydrochloric acid, and immediately insert the stopper. Shake the flask repeatedly during 30 min, allow it to stand for 15 min, quickly add 5 mL of potassium iodide solution (1 in 5), taking precautions against the escape of bromine vapor, and at once insert the stopper. Shake thoroughly, remove the stopper, and rinse it and the neck of the flask with a small quantity of water so that the washing flows into the flask. Add 1 mL of chloroform, and shake the mixture. Titrate the liberated iodine with *Back-titrant*, adding 3 mL of starch TS as the endpoint is approached. Perform a blank determination. Each mL of 0.1 N bromine is equivalent to 1.569 mg of phenol (C_6H_6O).

Acceptance criteria: 99.0%–100.5% on the anhydrous basis

IMPURITIES• **LIMIT OF NONVOLATILE RESIDUE**

Sample: 5 g

Analysis: Heat the *Sample* in a tared porcelain dish on a steam bath until it has evaporated, and dry the residue at 105° for 1 h.

Acceptance criteria: NMT 0.05%

SPECIFIC TESTS• **CLARITY OF SOLUTION AND REACTION**

Sample solution: 1 in 15

Acceptance criteria: The *Sample solution* is clear, and it is neutral or acid to litmus paper.

• **CONGEALING TEMPERATURE** (651): NLT 39°• **WATER DETERMINATION, Method I** (921): NMT 0.5%**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:** Label it to indicate the name and amount of any substance added as a stabilizer.

Camphorated Phenol Topical Gel**DEFINITION**

Camphorated Phenol Topical Gel is a mixture of Camphor and Phenol in a suitable gel vehicle. It contains NLT

90.0% and NMT 110.0% of the labeled amount of camphor ($C_{10}H_{16}O$) and phenol (C_6H_6O).

IDENTIFICATION

- **A.** The retention times of the camphor and phenol peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the Assay.

ASSAY• **PROCEDURE**

Internal standard solution: 10 mg/mL of *n*-dodecane in chloroform

Standard stock solution: 9.6 mg/mL of USP Phenol RS and 22.4 mg/mL of USP Camphor RS, in chloroform

Standard solution: 0.96 mg/mL of USP Phenol RS, 2.24 mg/mL of USP Camphor RS, and 1 mg/mL of *n*-dodecane in chloroform from *Standard stock solution* and *Internal standard solution*

Sample solution: Transfer 1 g of Topical Gel to a 50-mL flask. Add 5.0 mL of *Internal standard solution*, and dilute with chloroform to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 2-mm × 1.8-m glass; packed with 100- to 120-mesh S1A, coated with 15% G44

Carrier gas: Helium

Temperatures

Detector: 200°

Column: 140°

Injection volume: 1–2 µL

System suitabilitySample: *Standard solution*

[NOTE—The relative retention times are 0.3 for phenol, 0.8 for camphor, and 1.0 for the internal standard.]

Suitability requirements

Resolution: NLT 2.0 between camphor and the internal standard, and NLT 5.0 between phenol and camphor

Relative standard deviation: NMT 2.0% of the peak response ratio of camphor and phenol to the internal standard for five consecutive injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of camphor (w/w) and phenol (w/w) in the portion of Topical Gel taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of the corresponding analyte to the internal standard from the *Sample solution*

R_S = peak response ratio of the corresponding analyte to the internal standard from the *Standard solution*

C_S = concentration of the appropriate USP Reference Standard in the *Standard solution* (mg/mL)

C_U = nominal concentration of the appropriate analyte in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at room temperature, avoid excessive heat, and close the cover after each use.

USP Camphor RS
USP Phenol RS

Liquefied Phenol

DEFINITION

Liquefied Phenol is Phenol maintained in a liquid condition by the presence of about 10% of water. It contains NLT 89.0% by weight of C_6H_6O . It may contain a suitable stabilizer.

[CAUTION—Avoid contact with skin because serious burns may result.]

[NOTE—When phenol is to be mixed with a fixed oil, mineral oil, or white petrolatum, use crystalline Phenol, not Liquefied Phenol.]

IDENTIFICATION

- **A.** To a solution add bromine TS: a white precipitate is formed, and it dissolves at first but becomes permanent as more of the reagent is added.
- **B.** To 10 mL of a solution (1 in 100) add 1 drop of ferric chloride TS: a violet color is produced.

ASSAY

• **PROCEDURE**

Sample solution: Place 2 g of Liquefied Phenol in a 100-mL volumetric flask, and dilute with water to volume.

Analysis: Pipet 20 mL of the *Sample solution* into an iodine flask, add 30.0 mL of 0.1 N bromine VS, then add 5 mL of hydrochloric acid, and immediately insert the stopper. Shake the flask repeatedly during 30 min, allow it to stand for 15 min, add quickly 5 mL of potassium iodide solution (1 in 5), taking precautions against the escape of bromine vapor, and at once insert the stopper in the flask. Shake thoroughly, remove the stopper, and rinse it and the neck of the flask with a small quantity of water so that the washing flows into the flask. Add 1 mL of chloroform, and shake the mixture.

Titrate the liberated iodine with 0.1 N sodium thiosulfate VS, adding 3 mL of starch TS as the endpoint is approached. Perform a blank determination (see *Titrimetry* (541), *Residual Titrations*). Each mL of 0.1 N bromine is equivalent to 1.569 mg of C_6H_6O .

Acceptance criteria: NLT 89.0% by weight of C_6H_6O

SPECIFIC TESTS

- **CLARITY OF SOLUTION AND REACTION:** A solution (1 in 15) is clear, and is neutral or acid to litmus paper.
- **LIMIT OF NONVOLATILE RESIDUE:** Heat 5 g in a tared porcelain dish on a steam bath until it has evaporated, and dry the residue at 105° for 1 h: NMT 0.05% of residue remains.
- **DISTILLING RANGE, Method I (721):** NMT 182.5°, an air-cooled condenser being used

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant glass containers.
- **LABELING:** Label it to indicate the name and amount of any substance added as a stabilizer.

Phenoxybenzamine Hydrochloride

$C_{18}H_{22}ClNO \cdot HCl$ 340.29
 Benzenemethanamine, *N*-(2-chloroethyl)-*N*-(1-methyl-2-phenoxyethyl)-, hydrochloride;
N-(2-Chloroethyl)-*N*-(1-methyl-2-phenoxyethyl)benzylamine hydrochloride [63-92-3].

DEFINITION

Phenoxybenzamine Hydrochloride contains NLT 98.0% and NMT 101.0% of phenoxybenzamine hydrochloride ($C_{18}H_{22}ClNO \cdot HCl$), calculated on the dried basis.

IDENTIFICATION

A. INFRARED ABSORPTION (197K)

B. ULTRAVIOLET ABSORPTION (197U)

Sample solution: 1 mg/mL of Phenoxybenzamine Hydrochloride in methanol

Analytical wavelength: 275 nm

Acceptance criteria: Absorptivities, calculated on the dried basis, do not differ by more than 3.0%.

ASSAY

PROCEDURE

Sample: 500 mg of Phenoxybenzamine Hydrochloride

Mode: Titrimetry

Titrant: 0.1 N perchloric acid VS

Endpoint detection: Potentiometric

Analysis: Dissolve the *Sample* in 50 mL of glacial acetic acid, add 15 mL of mercuric acetate TS, and titrate with *Titrant*, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 34.03 mg of phenoxybenzamine hydrochloride ($C_{18}H_{22}ClNO \cdot HCl$).

Acceptance criteria: 98.0%–101.0% on the dried basis

IMPURITIES

ORDINARY IMPURITIES (466)

Standard solution: Methanol

Sample solution: Methanol

Eluent: Toluene and acetone (1:1)

Visualization: 1

Acceptance criteria: Meets the requirements

SPECIFIC TESTS

MELTING RANGE OR TEMPERATURE, Class I (741):

136°–141°

LOSS ON DRYING (731)

Analysis: Dry a sample under vacuum at 60° for 2 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

PACKAGING AND STORAGE: Preserve in well-closed containers.

USP REFERENCE STANDARDS (11)

USP Phenoxybenzamine Hydrochloride RS

Phenoxybenzamine Hydrochloride Capsules

DEFINITION

Phenoxybenzamine Hydrochloride Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of phenoxybenzamine hydrochloride ($C_{18}H_{22}ClNO \cdot HCl$).

IDENTIFICATION

Delete the following:

A. A. ULTRAVIOLET ABSORPTION

Analytical wavelengths: 268 and 272 nm

Sample solution: 0.15 mg/mL of phenoxybenzamine hydrochloride in acidic alcohol (1 in 1000 solution of hydrochloric acid in alcohol)

Acceptance criteria: The ratio A_{268}/A_{272} of the maximum at 268 ± 2 nm and the minimum at 272 ± 2 nm is between 1.75 and 1.95. Δ USP40

Add the following:

A. A. The UV absorption spectra of the phenoxybenzamine peak of the *Sample solution* exhibit maxima and minima at the same wavelengths as those of the corresponding peak from the *Standard solution*, as obtained in the *Assay*. Δ USP40

Add the following:

A. B. The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. Δ USP40

ASSAY

Change to read:

PROCEDURE

Solution A: 2.2 mg/mL of anhydrous monobasic sodium phosphate in water. Adjust with Δ USP40 phosphoric acid to a pH of 3.0.

Mobile phase: Filtered and degassed mixture of *Solution A* and acetonitrile (45:55)

Standard solution: 0.2 mg/mL of USP Phenoxybenzamine Hydrochloride RS in acetonitrile. [NOTE—Sonicate if necessary.]

System suitability solution: 10 mL of the *Standard solution* and 0.5 mL of 0.1 N sodium hydroxide taken in a vial. [NOTE—Basic solutions of phenoxybenzamine hydrochloride will produce the known degradant, tertiary amine phenoxybenzamine—the second major peak that elutes before the phenoxybenzamine peak and has a relative retention time of about 0.3 and an unknown related substance. Severe degradation of the drug substance will be observed if the solution is allowed to stand for more than 1 h.]

Sample solution: Nominally 0.2 mg/mL of phenoxybenzamine hydrochloride in acetonitrile prepared as follows. Remove, as completely as possible, the contents of NLT 20 Capsules. Transfer a portion of the mixed powder, equivalent to about 10 mg of phenoxybenzamine hydrochloride, to a 50-mL volumetric flask. Add about 40 mL of acetonitrile, and sonicate for 15 min with occasional swirling. Cool, and dilute with acetoni-

trile to volume to obtain the concentration, based on the label claim. Allow the sample to stand undisturbed for 30 min such that the undissolved material settles to the bottom. Transfer the top clear solution into HPLC vials, and use as the *Sample solution*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2%

Calculate the percentage of the labeled amount of phenoxybenzamine hydrochloride ($C_{18}H_{22}ClNO \cdot HCl$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Phenoxybenzamine Hydrochloride RS from the *Standard solution* (mg/mL)

L = label claim (mg/Capsule)

V = volume of Medium, 500 mL

Tolerances: NLT 75% (Q) of the labeled amount of phenoxybenzamine hydrochloride ($C_{18}H_{22}ClNO \cdot HCl$) is dissolved.

Change to read:

- **UNIFORMITY OF DOSAGE UNITS (905):**▲USP40 Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

Solution A, Mobile phase, *Standard solution*, *System suitability solution*, *Sample solution*, *Chromatographic system*, and *System suitability*: Proceed as directed in the Assay.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each individual impurity in the portion of Capsules taken:

$$\text{Result} = (r_U/r_T) \times (1/F) \times 100$$

r_U = peak response of the individual impurity from the *Sample solution*

r_T = sum of all the peak responses from the *Sample solution*

F = relative response factor, 1.1 for phenoxybenzamine tertiary amine, and 1.0 for all other individual impurities

Acceptance criteria

Individual impurities: NMT 0.5% of phenoxybenzamine tertiary amine; NMT 0.1% of any other specified or unspecified individual impurity (degradant)

Total impurities: NMT 0.5%, includes both specified and unspecified

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• USP REFERENCE STANDARDS (11)

USP Phenoxybenzamine Hydrochloride RS

Phenoxybenzamine Hydrochloride Compounded Oral Suspension

DEFINITION

Phenoxybenzamine Hydrochloride Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of phenoxybenzamine hydrochloride ($C_{18}H_{22}ClNO \cdot HCl$).

Prepare Phenoxybenzamine Hydrochloride Compounded Oral Suspension 10 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Phenoxybenzamine Hydrochloride powder	1 g
Corn Oil, NF, a sufficient quantity to make	100 mL

Pour the weighed *Phenoxybenzamine Hydrochloride powder* into a suitable mortar. Wet the powder with a small amount of *Corn Oil*, and triturate to make a smooth paste. Add the *Corn Oil* to make the mortar contents pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated container using the *Corn Oil* to rinse the mortar. Add sufficient *Corn Oil* to bring the preparation to final volume. Shake to mix well.

ASSAY

• PROCEDURE

Solution A: 25 mM monobasic potassium phosphate adjusted with phosphoric acid to a pH of 3.1

Mobile phase: Acetonitrile and *Solution A* (70:30)

Diluent: Prepare a mixture of 20 mL of acetonitrile and 80 mL of isopropyl alcohol in a conical flask. Add 10 g of anhydrous sodium sulfate to the flask, shake well for 1 min, and allow the sodium sulfate to precipitate to the bottom. [NOTE—The addition of anhydrous sodium sulfate removes trace amounts of water in the solvent.]

Standard solution: 0.5 mg/mL of phenoxybenzamine hydrochloride prepared from USP Phenoxybenzamine Hydrochloride RS in acetonitrile

Sample solution: Shake thoroughly each bottle of Oral Suspension. Transfer 0.5 mL of the Oral Suspension into a 10-mL volumetric flask, dilute with *Diluent* to volume, and mix well to dissolve.

Chromatographic system
(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 3.9-mm × 15-cm; 5-μm packing L1

Flow rate: 1.5 mL/min

Injection volume: 10 μL

System suitability

Sample: *Standard solution*

[NOTE—The retention time for phenoxybenzamine hydrochloride is about 5.2 min.]

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of phenoxybenzamine hydrochloride ($C_{18}H_{22}ClNO \cdot HCl$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of phenoxybenzamine hydrochloride from the *Sample solution*

r_S = peak response of phenoxybenzamine hydrochloride from the *Standard solution*

C_S = concentration of phenoxybenzamine hydrochloride in the *Standard solution* (mg/mL)

C_U = nominal concentration of phenoxybenzamine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at 2°–8° or at controlled room temperature.

- **BEYOND-USE DATE:** NMT 90 days after the date on which it was compounded when stored at 2°–8° or controlled room temperature
- **LABELING:** Label it to indicate that it is to be well-shaken immediately before use, and to state the *Beyond-Use Date*.
- **USP REFERENCE STANDARDS (11)**
USP Phenoxybenzamine Hydrochloride RS

Phensuximide

$C_{11}H_{11}NO_2$ 189.21

2,5-Pyrrolidinedione, 1-methyl-3-phenyl-, (±)-.
(±)-N-Methyl-2-phenylsuccinimide [86-34-0].

» Phensuximide contains not less than 97.0 percent and not more than 103.0 percent of $C_{11}H_{11}NO_2$, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Phensuximide RS

Identification—

A: *Infrared Absorption* (197K).

B: *Ultraviolet Absorption* (197U)—

Solution: 400 μg per mL.

Medium: alcohol.

Melting range, Class I (741): between 68° and 74°.

Water Determination, Method I (921): not more than 1.0%.

Residue on ignition (281): not more than 0.5%.

Limit of cyanide—Dissolve 1.0 g in 10 mL of warm alcohol, and add 3 drops of ferrous sulfate TS, 1 mL of 1 N sodium hydroxide, and a few drops of ferric chloride TS. Warm gently, and finally acidify with 2 N sulfuric acid: no blue precipitate or blue color is formed within 15 minutes.

Ordinary impurities (466)—

Test solution: 200 mg of phensuximide per mL in methylene chloride.

Standard solutions: 1.0, 2.0, and 4.0 mg per mL in methylene chloride.

Application volume: 5 μL.

Eluant: a mixture of ethyl acetate and hexanes (1:1).

Visualization: 6.

Assay—Transfer about 200 mg of Phensuximide, accurately weighed, to a 50-mL volumetric flask. Dissolve in 40 mL of alcohol, dilute with alcohol to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with alcohol to volume, and mix. Concomitantly determine the absorbances of this solution and of a *Standard solution* of USP Phensuximide RS, in the same medium having a known concentration of about 400 μg per mL, in 1-cm cells at the wavelength of maximum absorbance at about 258 nm, with a suitable spectrophotometer, using alcohol as the blank. Calculate the quantity, in mg, of $C_{11}H_{11}NO_2$ in the Phensuximide taken by the formula:

$$0.5C(A_U / A_S)$$

in which C is the concentration, in μg per mL, of USP Phensuximide RS in the *Standard solution*, and A_U and A_S are the absorbances of the solution from Phensuximide and the *Standard solution*, respectively.

Phensuximide Capsules

» Phensuximide Capsules contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{11}H_{11}NO_2$.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Phensuximide RS

Identification—

A: The contents of Capsules respond to *Identification test A* under *Phensuximide*.

B: The retention time exhibited by phensuximide in the chromatogram of the *Assay preparation* corresponds to that of phensuximide in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Dissolution (711)—

Medium: water; 900 mL.

Apparatus 1: 100 rpm.

Time: 120 minutes.

Procedure—Determine the amount of $C_{11}H_{11}NO_2$ dissolved, employing the procedure set forth in the *Assay*, making any necessary modifications.

Tolerances—Not less than 75% (Q) of the labeled amount of $C_{11}H_{11}NO_2$ is dissolved in 120 minutes.

Uniformity of dosage units (905): meet the requirements.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of water and acetonitrile (55:45). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Dissolve an accurately weighed quantity of USP Phensuximide RS in *Mobile phase* to obtain a solution having a known concentration of about 1 mg per mL.

Assay preparation—Place 10 Capsules in a 500-mL volumetric flask, and add 280 mL of water. Sonicate in a water bath at 40° to 50°, with occasional shaking, until the Capsules have broken, and cool to room temperature. Dilute with acetonitrile to volume, mix, and filter. Transfer an accurately measured volume of this specimen solution, equivalent to about 50 mg of Phensuximide, to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency determined from the analyte peak is not less than 2100 theoretical plates, and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 20 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{11}H_{11}NO_2$ per Capsule taken by the formula:

$$2500(C/V)(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of USP Phensuximide RS in the *Standard preparation*, *V* is the volume, in mL, of specimen solution taken for the *Assay preparation*, and r_U and r_S are the phensuximide peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Phentermine Hydrochloride

$C_{10}H_{15}N \cdot HCl$

185.69

Benzeneethanamine, α,α -dimethyl-, hydrochloride; α,α -Dimethylphenethylamine hydrochloride [1197-21-3].

DEFINITION

Phentermine Hydrochloride contains NLT 98.0% and NMT 101.0% of phentermine hydrochloride ($C_{10}H_{15}N \cdot HCl$), calculated on the dried basis.

IDENTIFICATION

• **A. INFRARED ABSORPTION** (197K)

• **B. ULTRAVIOLET ABSORPTION** (197U)

Analytical wavelength: 256 nm

Solution: 600 μ g/mL

Medium: 0.1 N hydrochloric acid

Acceptance criteria: Absorptivities at the *Analytical wavelength*, calculated on the dried basis, do not differ by more than 2.0%.

• **C. IDENTIFICATION TESTS—GENERAL, Chloride** (191)

ASSAY

• **PROCEDURE**

Sample: About 400 mg of Phentermine Hydrochloride

Analysis: Dissolve the *Sample* in 40 mL of glacial acetic acid, and add 10 mL of mercuric acetate TS, warming slightly to effect solution. Cool to room temperature, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 18.57 mg of phentermine hydrochloride ($C_{10}H_{15}N \cdot HCl$).

Acceptance criteria: 98.0%–101.0% on the dried basis

IMPURITIES

• **RESIDUE ON IGNITION** (281): NMT 0.1%

• **ORGANIC IMPURITIES**

Standard stock solution: 2 mg/mL of USP Phentermine Hydrochloride RS in chloroform

Standard solutions: Dilute the *Standard stock solution* with chloroform to obtain the concentrations designated in *Table 1* by letter.

Table 1

Standard solution	Dilution	Concentration (mg/mL)	Percentage (for comparison with Sample solution)
A	(undiluted)	2.0	1.0
B	(1 in 2)	1.0	0.5
C	(1 in 5)	0.4	0.2
D	(1 in 10)	0.2	0.1

Sample solution: 200 mg/mL of Phentermine Hydrochloride in chloroform

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 10 μ L

Developing solvent system: Chloroform, cyclohexane, and diethylamine (50:40:10)

Analysis

Samples: *Standard solutions* and *Sample solution*

Position the plate in a chromatographic chamber, and develop the chromatograms in the *Developing solvent system* until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate in air. Examine the plate under short-wavelength UV light. Compare the intensities of any secondary spots observed in the *Sample solution* with those of the principal spots in the *Standard solutions*.

Acceptance criteria: The sum of the intensities of secondary spots from the *Sample solution* corresponds to NMT 1.0% of related compounds, with no single impurity corresponding to more than 0.5%.

SPECIFIC TESTS

• **MELTING RANGE OR TEMPERATURE** (741): 202°–205°

• **pH** (791)

Sample solution: 1 in 50

Acceptance criteria: 5.0–6.0

• **LOSS ON DRYING** (731)

Analysis: Dry at 105° for 3 h.

Acceptance criteria: NMT 2.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **USP REFERENCE STANDARDS** (11)

USP Phentermine Hydrochloride RS

Phentermine Hydrochloride Capsules**DEFINITION**

Phentermine Hydrochloride Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of phentermine hydrochloride ($C_{10}H_{15}N \cdot HCl$).

IDENTIFICATION

• **A.**

Sample solution: Stir a portion of the Capsule contents in acetone to prepare a solution containing a nominal concentration at about 1 mg/mL of phentermine hydrochloride.

Analysis: Filter the *Sample solution* using an acetone-resistant filter. Transfer 1 mL of the clear filtrate to a mortar containing about 200 mg of potassium bromide, triturate with a pestle, and air-dry to allow the acetone to evaporate. Place in an oven at 125° for 30 min to dry the mixture.

Acceptance criteria: The IR absorption spectrum of a potassium bromide dispersion prepared from the residue exhibits maxima only at the same wavelengths as that of a similar preparation of USP Phentermine Hydrochloride RS.

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **PROCEDURE**

Mobile phase: 1.1 g of sodium 1-heptanesulfonate in 575 mL of water. Add 25 mL of dilute glacial acetic acid (14 in 100) and 400 mL of methanol. Adjust dropwise, if necessary, with glacial acetic acid to a pH of 3.3 ± 0.1 . Pass through a membrane filter of 0.5- μ m pore size. The volume of methanol may be adjusted to provide a suitable retention time for phentermine hydrochloride (about 8 min).

Diluent: 0.04 M phosphoric acid

Standard solution: 0.4 mg/mL of USP Phentermine Hydrochloride RS in *Diluent*

Sample solution: Remove, as completely as possible, the contents of NLT 20 Capsules, and weigh. Transfer a portion of the mixed powder, nominally equivalent to about 20 mg of phentermine hydrochloride, to a 50-mL volumetric flask. Add 40 mL of *Diluent*, and sonicate for 15 min. Dilute with *Diluent* to volume, and mix. Pass through a membrane filter of 0.5- μ m pore size, discarding the first few mL of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm \times 30-cm; packing L1

Flow rate: 2 mL/min

Injection volume: 50 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of phentermine hydrochloride ($C_{10}H_{15}N \cdot HCl$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Phentermine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of phentermine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **DISSOLUTION**, *Procedure for a Pooled Sample* (711)

Medium: Water; 900 mL. Use 500 mL for Capsules containing 15 mg or less of phentermine hydrochloride.

Apparatus 2: 50 rpm

Time: 45 min

Analysis: Determine the amount of phentermine hydrochloride ($C_{10}H_{15}N \cdot HCl$) dissolved, by using the *Procedure* set forth in the *Assay*, making any necessary modifications including concentration of the analyte in the volume of the *Sample solution* taken.

Tolerances: NLT 75% (Q) of the labeled amount of phentermine hydrochloride ($C_{10}H_{15}N \cdot HCl$) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **USP REFERENCE STANDARDS** (11)

USP Phentermine Hydrochloride RS

Phentermine Hydrochloride Tablets**DEFINITION**

Phentermine Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of phentermine hydrochloride ($C_{10}H_{15}N \cdot HCl$).

IDENTIFICATION

• **A.**

Sample solution: Stir a portion of finely powdered Tablet contents in acetone to prepare a solution containing a nominal concentration at about 1 mg/mL of phentermine hydrochloride.

Analysis: Filter the *Sample solution* using an acetone resistant filter. Transfer 1 mL of the clear filtrate to a mortar containing about 200 mg of potassium bromide, triturate with a pestle, and air-dry to allow the acetone to evaporate. Place in an oven at 125° for 30 min to dry the mixture.

Acceptance criteria: The IR absorption spectrum of a potassium bromide dispersion prepared from the residue exhibits maxima only at the same wavelengths as that of a similar preparation of USP Phentermine Hydrochloride RS.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Mobile phase: Prepare a suitably degassed solution containing 0.03% diethylamine in methanol.

Internal standard solution: About 0.02 mg/mL of caffeine in *Mobile phase*.

Standard solution: USP Phentermine Hydrochloride RS in the *Internal standard solution*, equivalent to 0.75 mg/mL of phentermine hydrochloride.

Sample solution: Transfer an equivalent to 7.5 mg, from NLT 20 finely powdered Tablets, to a suitable flask. Pipet 10.0 mL of the *Internal standard solution* into the flask. Insert the stopper, mix, and sonicate for about 10 min. Pass through a filter of 0.5-μm pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1.5 mL/min

Injection volume: 10 μL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for caffeine and phentermine are about 0.5 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 4 between caffeine and phentermine

Column efficiency: NLT 2000 theoretical plates

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of phentermine hydrochloride (C₁₀H₁₅N · HCl) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of phentermine to the internal standard from the *Sample solution*

R_S = peak response ratio of phentermine to the internal standard from the *Standard solution*

C_S = concentration of USP Phentermine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of phentermine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

DISSOLUTION, Procedure for a Pooled Sample (711)

Medium: Water; 900 mL. Use 500 mL for Tablets containing 15 mg or less of phentermine hydrochloride.

Apparatus 2: 50 rpm

Time: 45 min

Solution A: Dissolve 1.1 g of sodium 1-heptanesulfonate in 1 L of water. Add 3.5 mL of glacial acetic acid, and mix.

Mobile phase: Methanol and *Solution A* (525:475). Filter, degas, and adjust with phosphoric acid to a pH of 2.5.

Sample solution: Filtered portion of the pooled sample under test

Standard solution: Dissolve USP Phentermine Hydrochloride RS in water, and dilute with water, if necessary, to obtain a known concentration approximately equivalent to the *Sample solution*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 208 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1 mL/min

Injection volume: 25 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Sample solution* and *Standard solution*

Calculate the percentage of the labeled amount of phentermine hydrochloride (C₁₀H₁₅N · HCl) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L)$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Phentermine Hydrochloride RS in the *Standard solution* (mg/mL)

V = volume of *Medium*, 900 mL or 500 mL

L = label claim (mg/Tablet)

Tolerances: NLT 75% (Q) of the labeled amount of phentermine hydrochloride (C₁₀H₁₅N · HCl) is dissolved.

UNIFORMITY OF DOSAGE UNITS (905)

Procedure for content uniformity

Sample solution: Proceed as directed in the *Assay*, except prepare the *Sample solution* as follows. Transfer 1 Tablet to each of 10 suitable containers, and add 1 mL of water and 10 mL of the *Internal standard solution* to each. Mix, sonicate for about 10 min after each Tablet has disintegrated, and filter.

Acceptance criteria: Meet the requirements

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **USP REFERENCE STANDARDS (11)**

USP Phentermine Hydrochloride RS

Phentolamine Mesylate

C₁₇H₁₉N₃O · CH₄O₃S 377.46

Phenol, 3-[[[4,5-dihydro-1H-imidazol-2-yl)methyl](4-methylphenyl)amino]-, monomethanesulfonate (salt).

m-[N-(2-Imidazolin-2-ylmethyl)-*p*-toluidino]phenol monomethanesulfonate (salt) [65-28-1].

» Phentolamine Mesylate contains not less than 98.0 percent and not more than 102.0 percent of C₁₇H₁₉N₃O · CH₄O₃S, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

USP Reference standards (11)—
USP Phentolamine Mesylate RS

Identification—

A: Infrared Absorption (197M).

B: Ultraviolet Absorption (197U)—

Solution: 20 µg per mL.

Medium: water.

C: The R_f value of the principal spot in the chromatogram of the *Identification preparation* corresponds to that of *Standard preparation A* as obtained in the test for *Chromatographic purity*.

Loss on drying (731)—Dry it in vacuum at 60° for 4 hours; it loses not more than 0.5% of its weight.

Residue on ignition (281): not more than 0.1%.

Sulfate (221)—A 0.10-g portion shows no more sulfate than corresponds to 0.20 mL of 0.020 N sulfuric acid (0.2%).

Chromatographic purity—

Standard preparations—Dissolve USP Phentolamine Mesylate RS in methanol, and mix to obtain *Standard preparation A* having a known concentration of 50 µg per mL. Quantitatively dilute with methanol to obtain *Standard preparations*, designated below by letter, having the following compositions:

Standard preparation	Dilution	Concentration (µg RS per mL)	Percentage (% for comparison with test specimen)
A	(undiluted)	50	0.5
B	(3 in 5)	30	0.3
C	(1 in 5)	10	0.1

Test preparation—Dissolve an accurately weighed quantity of Phentolamine Mesylate in methanol to obtain a solution containing 10 mg per mL.

Identification preparation—Dilute a portion of the *Test preparation* quantitatively with methanol to obtain a solution containing 50 µg per mL.

Detection reagent—Prepare (1) a solution of 1 g of potassium ferricyanide in 20 mL of water, and (2) a solution of 1.9 g of ferric chloride in 20 mL of water. Just prior to use, mix equal volumes of the solutions.

Procedure—Apply separately 5 µL of the *Test preparation*, 5 µL of the *Identification preparation*, and 5 µL of each *Standard preparation* to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel, and allow to dry. Position the plate in a chromatographic chamber, and develop the chromatograms in a solvent system consisting of a mixture of chloroform, diethylamine, and methanol (15:3:2) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and dry the plate at 100° for 1 hour. Spray the plate with *Detection reagent*. Within 15 minutes after spraying, compare the intensities of any secondary spots observed in the chromatogram of the *Test preparation* with those of the principal spots in the chromatograms of the *Standard preparations*: no secondary spot from the chromatogram of the *Test preparation* is larger or more intense than the principal spot obtained from *Standard preparation A* (0.5%), and the sum of the intensities of all secondary spots obtained from the *Test preparation* corresponds to not more than 1.0%.

Assay—

0.1 N Tetrabutylammonium hydroxide in isopropyl alcohol—Dilute with dehydrated isopropyl alcohol a commercially available 25% solution of tetrabutylammonium hydroxide in methanol, and standardize as directed under *Tetrabutylammonium Hydroxide, Tenth-Normal* (0.1 N) (see *Volumetric Solutions* in the section *Reagents, Indicators, and Solutions*), using dehydrated isopropyl alcohol instead of dimethylformamide.

Procedure—Dissolve with the aid of sonication, if necessary, about 300 mg of Phentolamine Mesylate, accurately weighed, in 100 mL of dehydrated isopropyl alcohol. Titrate in an atmosphere of nitrogen with 0.1 N Tetrabutylammonium hydroxide in isopropyl alcohol, determining the endpoint potentiometrically, using a glass electrode and a calomel electrode containing a saturated solution of tetramethylammonium chloride in dehydrated isopropyl alcohol (see *Titrimetry* (541)). Perform a blank determination, and make any necessary correction. Each mL of 0.1 N tetrabutylammonium hydroxide is equivalent to 37.75 mg of $C_{17}H_{19}N_3O \cdot CH_4O_3S$.

Phentolamine Mesylate for Injection

» Phentolamine Mesylate for Injection is sterile Phentolamine Mesylate or a sterile mixture of Phentolamine Mesylate with a suitable buffer or suitable diluents. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{17}H_{19}N_3O \cdot CH_4O_3S$.

Change to read:

Packaging and storage—Preserve as described in *Packaging and Storage Requirements* (659), *Injection Packaging, Packaging for constitution* (CN 1-May-2017).

USP Reference standards (11)—

USP Endotoxin RS

USP Phentolamine Mesylate RS

Constituted solution—At the time of use, it meets the requirements for *Injections and Implanted Drug Products* (1), *Specific Tests, Completeness and clarity of solutions*.

Identification—Mix a portion of it, equivalent to about 40 mg of phentolamine mesylate, with about 15 mL of chloroform. Filter into a beaker, and evaporate to dryness, taking precautions against introducing moisture: the residue so obtained responds to *Identification test A* under *Phentolamine Mesylate*.

Bacterial Endotoxins Test (85)—It contains not more than 5.8 USP Endotoxin Units per mg of phentolamine mesylate.

Uniformity of dosage units (905): meets the requirements.

Procedure for content uniformity—Dissolve the contents of 1 container in water to provide a solution containing about 20 µg of phentolamine mesylate per mL. Concomitantly determine the absorbances of this solution and of a solution of USP Phentolamine Mesylate RS, in the same medium, at a concentration of about 20 µg per mL, in 1-cm cells at the wavelength of maximum absorbance at about 278 nm, with a suitable spectrophotometer, using water as the blank. Cal-

culate the quantity, in mg, of $C_{17}H_{19}N_3O \cdot CH_4O_3S$ in the Phentolamine Mesylate for Injection taken by the formula:

$$(T/D)C(A_U/A_S)$$

in which T is the labeled quantity, in mg, of phentolamine mesylate in the Phentolamine Mesylate for Injection, D is the concentration, in μg per mL, of phentolamine mesylate in the solution from the Phentolamine Mesylate for Injection, based on the labeled quantity per container and the extent of dilution, C is the concentration, in μg per mL, of USP Phentolamine Mesylate RS in the Standard solution, and A_U and A_S are the absorbances of the solution from the Phentolamine Mesylate for Injection and the Standard solution, respectively.

pH (791): between 4.5 and 6.5, in a freshly prepared solution having a concentration of about 1 in 100.

Other requirements—It meets the requirements for *Sterility Tests* (71) and *Labeling* (7), *Labels and Labeling for Injectable Products*.

Assay—

Standard preparation—Transfer about 25 mg of USP Phentolamine Mesylate RS, accurately weighed, to a 50-mL volumetric flask, add water to volume, and mix.

Assay preparation—Dissolve the contents of 10 containers of Phentolamine Mesylate for Injection in a volume of water corresponding to the volume of solvent specified in the labeling. Transfer an aliquot, equivalent to about 25 mg of phentolamine mesylate, to a 50-mL volumetric flask, add water to volume, and mix.

Procedure—Pipet 5-mL portions, respectively, of the *Standard preparation*, *Assay preparation*, and water to provide a blank, into separate 125-mL separators. Into each separator pipet 5-mL portions of 0.1 N hydrochloric acid and saturated picric acid solution. Extract with three 25-mL portions of chloroform, filtering each portion through chloroform-washed cotton into a 100-mL volumetric flask. Dilute with chloroform to volume, and mix. Concomitantly determine the absorbances of the solutions from the *Assay preparation* and the *Standard preparation* in 1-cm cells at the wavelength of maximum absorbance at about 410 nm, with a suitable spectrophotometer, against the blank. Calculate the quantity, in mg, of $C_{17}H_{19}N_3O \cdot CH_4O_3S$ in the aliquot of Phentolamine Mesylate for Injection taken by the formula:

$$50C(A_U/A_S)$$

in which C is the concentration, in mg per mL, of USP Phentolamine Mesylate RS in the *Standard preparation*, and A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

Phenylalanine

$C_9H_{11}NO_2$ 165.19
L-Phenylalanine [63-91-2].

DEFINITION

Phenylalanine contains NLT 98.5% and NMT 101.5% of L-phenylalanine ($C_9H_{11}NO_2$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)

ASSAY

• PROCEDURE

Sample: 160 mg of Phenylalanine

Blank: Mix 3 mL of formic acid and 50 mL of glacial acetic acid.

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 N perchloric acid VS

Endpoint detection: Potentiometric

Analysis: Dissolve the *Sample* in 3 mL of formic acid and 50 mL of glacial acetic acid. Titrate with the *Titrant*. Perform the *Blank* determination.

Calculate the percentage of phenylalanine ($C_9H_{11}NO_2$) in the *Sample* taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F]/W\} \times 100$$

V_S = *Titrant* volume consumed by the *Sample* (mL)

V_B = *Titrant* volume consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 165.2 mg/mEq

W = *Sample* weight (mg)

Acceptance criteria: 98.5%–101.5% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.4%

- **CHLORIDE AND SULFATE, Chloride** (221)

Standard solution: 0.50 mL of 0.020 N hydrochloric acid

Sample: 0.73 g of Phenylalanine

Acceptance criteria: NMT 0.05%

- **CHLORIDE AND SULFATE, Sulfate** (221)

Standard solution: 0.10 mL of 0.020 N sulfuric acid

Sample: 0.33 g of Phenylalanine

Acceptance criteria: NMT 0.03%

- **IRON** (241): NMT 30 ppm

Delete the following:

- **HEAVY METALS, Method II** (231): NMT 15 ppm (Official 1-

Jan-2018)

- **RELATED COMPOUNDS**

Diluent: Glacial acetic acid and water (1:1)

Standard solution: 0.05 mg/mL of USP

L-Phenylalanine RS in *Diluent*. [NOTE—This solution has a concentration equivalent to 0.5% of that of the *Sample* solution.]

System suitability solution: 0.4 mg/mL each of USP

L-Phenylalanine RS and USP L-Tyrosine RS in *Diluent*

Sample solution: 10 mg/mL of Phenylalanine in *Diluent*

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 5 μL

Developing solvent system: Butyl alcohol, glacial acetic acid, and water (3:1:1)

Spray reagent: 2 mg/mL of ninhydrin in a mixture of butyl alcohol and 2 N acetic acid (95:5)

System suitability

Suitability requirements: The chromatogram of the *System suitability solution* exhibits two clearly separated spots.

Analysis

Samples: *Standard solution*, *System suitability solution*, and *Sample solution*

After air-drying the plate, spray with *Spray reagent*, and heat between 100° and 105° for 15 min. Examine the plate under white light.

Acceptance criteria: Any secondary spot of the *Sample solution* is not larger or more intense than the principal spot of the *Standard solution*.

Individual impurities: NMT 0.5%

Total impurities: NMT 2.0%

SPECIFIC TESTS

• **OPTICAL ROTATION, Specific Rotation (781S)**

Sample solution: 20 mg/mL in water

Acceptance criteria: -32.7° to -34.7°

• **pH (791)**

Sample solution: 10 mg/mL solution

Acceptance criteria: 5.4–6.0

• **LOSS ON DRYING (731):** Dry a sample at 105° for 3 h: it loses NMT 0.3% of its weight.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **USP REFERENCE STANDARDS (11)**

USP L-Phenylalanine RS

USP L-Tyrosine RS

Phenylbutazone

$C_{19}H_{20}N_2O_2$ 308.37

3,5-Pyrazolidinedione, 4-butyl-1,2-diphenyl-

4-Butyl-1,2-diphenyl-3,5-pyrazolidinedione [50-33-9].

» Phenylbutazone contains not less than 98.0 percent and not more than 102.0 percent of $C_{19}H_{20}N_2O_2$, calculated on the dried basis.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Phenylbutazone RS

Identification—

A: Infrared Absorption (197K).

B: Ultraviolet Absorption (197U)—

Solution: 10 μ g per mL.

Medium: sodium hydroxide solution (1 in 2500).

Absorptivities at 264 nm, calculated on the dried basis, do not differ by more than 2.0%.

Melting range (741): between 104° and 107° .

Loss on drying (731)—Dry it in vacuum at a pressure of 30 ± 10 mm of mercury at 80° for 4 hours: it loses not more than 0.5% of its weight.

Residue on ignition (281): not more than 0.1%, 2.0 g being used for the test.

Chloride (221)—Boil 2.0 g with 60 mL of water for 5 minutes, cool, and filter. To a 30-mL portion of the filtrate add 1 mL of 2 N nitric acid and 1 mL of silver nitrate TS: the filtrate shows no more chloride than corresponds to 0.10 mL of 0.020 N hydrochloric acid (0.007%).

Sulfate (221)—To a 30-mL portion of the filtrate obtained in the test for *Chloride* add 2 mL of barium chloride TS: the mixture shows no more sulfate than corresponds to 0.10 mL of 0.020 N sulfuric acid (0.01%).

Delete the following:

• **Heavy metals, Method II (231):** 0.001%. • (Official 1-Jan-2018)

Assay—

Acetate buffer—Transfer 2.72 g of sodium acetate to a 1000-mL beaker, and dissolve in about 700 mL of water. Adjust with glacial acetic acid to a pH of 4.1. Filter through a 0.5- μ m filter, dilute with filtered water to 1000 mL, and mix.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile with 560 mL of *Acetate buffer* (440:560). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Internal standard solution—Dissolve 300 mg of desoxycorticosterone acetate in 200 mL of acetonitrile, and mix.

Standard preparation—Dissolve an accurately weighed quantity of USP Phenylbutazone RS in acetonitrile, with the aid of sonication, and dilute quantitatively with acetonitrile to obtain a solution having a concentration of about 1.4 mg per mL. Pipet 10 mL of this solution into a 50-mL volumetric flask, add 10.0 mL of *Internal standard solution*, dilute with acetonitrile to volume, and mix. [NOTE—Use this solution within 8 hours of its preparation.]

Assay preparation—Transfer about 140 mg of Phenylbutazone, accurately weighed, to a 100-mL volumetric flask, add 75 mL of acetonitrile, and sonicate to dissolve. Dilute with acetonitrile to volume, and mix. Pipet 10 mL of this solution into a 50-mL volumetric flask, add 10.0 mL of *Internal standard solution*, dilute with acetonitrile to volume, and mix. [NOTE—Use this solution within 8 hours of its preparation.]

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm \times 25-cm column that contains packing L7, preceded by a pre-column that contains packing L2. The flow rate is about 2.4 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution, R , of phenylbutazone and the internal standard is not less than 3.5, and the relative standard deviation of the ratio of their peak responses in replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 25 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 1.0 for the internal standard and 0.7 for phenylbutazone. Calculate the quantity, in mg, of $C_{19}H_{20}N_2O_2$ in the portion of Phenylbutazone taken by the formula:

$$500C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Phenylbutazone RS in the *Standard preparation*; and R_U and R_S are the ratios of the peak response of the phenylbutazone to that of the internal standard for the *Assay preparation* and the *Standard preparation*, respectively.

Phenylbutazone Boluses

» Phenylbutazone Boluses contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of phenylbutazone ($C_{19}H_{20}N_2O_2$) and nominally not less than 1 g of phenylbutazone per bolus.

Packaging and storage—Preserve in well-closed containers.

Labeling—Label Boluses to indicate that they are for veterinary use only.

USP Reference standards (11)—

USP Phenylbutazone RS

Identification—

A: Transfer a portion of powdered Boluses, equivalent to about 500 mg of phenylbutazone, to a 250-mL conical flask, add 100 mL of solvent hexane, and heat the mixture under reflux for 15 minutes. Filter the hot mixture, and allow the filtrate to cool. Separate the crystals thus formed by filtration, and dry in vacuum at 80° for 30 minutes: the phenylbutazone so obtained responds to *Identification test A* under *Phenylbutazone*.

B: The retention time of the phenylbutazone peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Disintegration (701): 45 minutes with disks, determined as directed for *Uncoated Tablets*, simulated gastric fluid being used as the immersion fluid.

Uniformity of dosage units (905)—meet the requirements for *Weight Variation*.

Assay—

Acetate buffer, Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system—Proceed as directed in the *Assay* under *Phenylbutazone*.

Assay preparation—Weigh and finely powder a Phenylbutazone Bolus. Transfer an accurately weighed portion of the powder, equivalent to about 500 mg of phenylbutazone, to a 250-mL volumetric flask. Transfer 10.0 mL of water to the flask, and shake by mechanical means for 15 minutes. Add about 120 mL of acetonitrile, and sonicate until insoluble material is dispersed into fine particles. Shake by mechanical means for 20 minutes, dilute with acetonitrile to volume, and mix. Transfer 7.0 mL of this solution to a 50-mL volumetric flask, add 10.0 mL of *Internal standard solution*, dilute with acetonitrile to volume, and mix. Pass a portion of this solution through a filter having a porosity of 0.5 µm or finer, discarding the first few mL of the filtrate. Use the clear filtrate as the *Assay preparation*. [NOTE—Use this solution within 8 hours of its preparation.]

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Phenylbutazone*. Calculate the quantity, in mg, of $C_{19}H_{20}N_2O_2$ in the portion of the Bolus taken by the formula:

$$1786C(R_U/R_S)$$

in which *C* is the concentration, in mg per mL, of USP Phenylbutazone RS in the *Standard preparation*, and R_U and R_S are the ratios of the peak responses of phenylbutazone to that of the internal standard obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Phenylbutazone Injection

» Phenylbutazone Injection is a sterile solution of Phenylbutazone in Sterile Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{19}H_{20}N_2O_2$.

Packaging and storage—Preserve in single-dose or multiple-dose containers, preferably of Type I glass. Protect from light, and store in a refrigerator.

Labeling—Label Injection to indicate that it is for veterinary use only.

USP Reference standards (11)—

USP Phenylbutazone RS

Clarity of solution—The Injection is essentially free from particles of foreign matter that can be observed on visual inspection.

Identification—

A: Transfer a volume of Injection, equivalent to about 500 mg of phenylbutazone, to a 250-mL conical flask, add 100 mL of solvent hexane, and heat the mixture under reflux for 15 minutes. Filter the hot mixture, and allow the filtrate to cool. Separate the crystals thus formed by filtration, and dry in vacuum at 80° for 30 minutes: the phenylbutazone so obtained responds to *Identification test A* under *Phenylbutazone*.

B: The retention time of the phenylbutazone peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation* as obtained in the *Assay*.

Sterility Tests (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

Bacterial Endotoxins Test (85)—It contains not more than 1.1 USP Endotoxin Units per mg of phenylbutazone.

pH (791): between 9.5 and 10.0.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—

Acetate buffer, Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system—Proceed as directed in the *Assay* under *Phenylbutazone*.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 200 mg of phenylbutazone, to a 100-mL volumetric flask. Dilute with acetonitrile to volume, and mix. Transfer 7.0 mL of this solution to a 50-mL volumetric flask, add 10.0 mL of *Internal standard solution*, dilute with acetonitrile to volume, and mix. [NOTE—Use this solution within 8 hours of its preparation.]

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Phenylbutazone*. Calculate the quantity, in mg, of $C_{19}H_{20}N_2O_2$ in each mL of the Injection taken by the formula:

$$350(C/V)(R_U/R_S)$$

in which *C* is the concentration, in mg per mL, of USP Phenylbutazone RS in the *Standard preparation*, *V* is the volume, in mL, of Injection taken to prepare the *Assay preparation*, and R_U and R_S are the ratios of the peak responses of phenylbutazone to that of the internal standard obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Phenylbutazone Tablets

» Phenylbutazone Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of phenylbutazone ($C_{19}H_{20}N_2O_2$) and nominally not more than 200 mg of phenylbutazone per Tablet.

Packaging and storage—Preserve in tight containers.

Labeling—Label Tablets to indicate that they are for veterinary use only.

USP Reference standards (11)—

USP Phenylbutazone RS

Identification—Transfer to a 250-mL conical flask a portion of powdered Tablets, equivalent to about 500 mg of

phenylbutazone, add 100 mL of solvent hexane, and heat the mixture under reflux for 15 minutes. Filter the hot mixture, and allow the filtrate to cool. Separate the crystals thus formed by filtration, and dry in vacuum at 80° for 30 minutes: the phenylbutazone so obtained responds to *Identification test A* under *Phenylbutazone*.

Dissolution (711)—

Medium: pH 7.5 simulated intestinal fluid TS (without the enzyme); 900 mL.

Apparatus 1: 100 rpm.

Time: 30 minutes.

Procedure—Determine the amount of $C_{19}H_{20}N_2O_2$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 264 nm on filtered portions of the solution under test, suitably diluted, if necessary, with **Medium**, using a suitable spectrophotometer, 1-cm cells, and **Medium** as the blank, in comparison with a solution of known concentration of USP Phenylbutazone RS in the same **Medium**.

Tolerances—Not less than 70% (*Q*) is dissolved in 30 minutes.

Uniformity of dosage units (905): meet the requirements.

Procedure for content uniformity—Transfer 1 Tablet to a 100-mL volumetric flask, add 60 mL of methanol, and shake by mechanical means for about 20 minutes or until the tablet is completely disintegrated. Dilute with methanol to volume, and mix. Filter a portion of mixture, discarding the first 10 mL of the filtrate. Dilute an accurately measured portion of the filtrate with sodium hydroxide solution (1 in 2500) to obtain a solution containing about 10 µg per mL. Prepare a solution of USP Phenylbutazone RS in methanol having a known concentration of about 1 mg per mL. Quantitatively dilute a portion of this solution with sodium hydroxide solution (1 in 2500) to obtain a Standard solution having a final known concentration of about 10 µg per mL. Concomitantly determine the absorbances of the solution from the Tablet and the Standard solution at the wavelength of maximum absorbance at about 264 nm with a suitable spectrophotometer, using sodium hydroxide solution (1 in 2500) as the blank. Calculate the quantity, in mg, of $C_{19}H_{20}N_2O_2$ in the Tablet by the formula:

$$(TC/D)(A_U / A_S)$$

in which *T* is the labeled quantity, in mg, of phenylbutazone in the Tablet; *C* is the concentration, in µg per mL, of USP Phenylbutazone RS in the Standard solution; *D* is the concentration, in µg per mL, of phenylbutazone in the solution from the Tablet based on the labeled quantity per Tablet and the extent of dilution; and *A_U* and *A_S* are the absorbances of the solution from the Tablet and the Standard solution, respectively.

Assay—

Acetate buffer, Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system—Proceed as directed in the Assay under *Phenylbutazone*.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Accurately weigh a portion of the powder, equivalent to about 500 mg of phenylbutazone, and transfer to a 250-mL volumetric flask. Pipet 50 mL of water into the flask, and shake by mechanical means for 15 minutes. Add about 120 mL of acetonitrile, and sonicate until insoluble material is dispersed into fine particles. Shake by mechanical means for 20 minutes, dilute with acetonitrile to volume, and mix. Centrifuge a portion of this solution. Pipet 7 mL of the solution into a 50-mL volumetric flask, add 10.0 mL of *Internal standard solution*, dilute with acetonitrile to volume, and mix. Pass a portion through a 0.5-µm filter, discarding

the first few mL of the filtrate. [NOTE—Use this solution within 8 hours of its preparation.]

Procedure—Proceed as directed for *Procedure* in the Assay under *Phenylbutazone*. Calculate the quantity, in mg, of phenylbutazone ($C_{19}H_{20}N_2O_2$) in the portion of Tablets taken by the formula:

$$1786C(R_U / R_S)$$

in which *C* is the concentration, in mg per mL, of USP Phenylbutazone RS in the *Standard preparation*; and *R_U* and *R_S* are the ratios of the peak response of phenylbutazone to that of the internal standard for the *Assay preparation* and the *Standard preparation*, respectively.

Phenylephrine Bitartrate

$C_9H_{13}NO_2 \cdot C_4H_6O_6$ 317.29
Benzenemethanol, 3-hydroxy-α-[(methylamino)methyl]-, (2*R*,3*R*)-2,3-dihydroxybutanedioate (1:1) (salt);
(*R*)-(-)-*m*-Hydroxy-α-[(methylamino)methyl]benzyl alcohol hydrogen tartrate [17162-39-9].

DEFINITION

Phenylephrine Bitartrate contains NLT 98.0% and NMT 102.0% of phenylephrine bitartrate ($C_9H_{13}NO_2 \cdot C_4H_6O_6$), calculated on the dried basis.

IDENTIFICATION

• A. INFRARED ABSORPTION (197K)

• B. IDENTIFICATION TESTS—GENERAL, Tartrate (191)

Sample: The alkaline filtrate from the test for *Optical Rotation* (781S), *Specific Rotation*

Acceptance criteria: The *Sample* responds positively to the test for *Tartrate* in *Identification Tests—General* (191).

C. The retention time of the major peak of the *Sample* solution corresponds to that of the *Standard* solution, as obtained in the Assay.

ASSAY

• PROCEDURE

Buffer: Dissolve 3.25 g of 1-octanesulfonic acid sodium salt monohydrate in 1 L of water, and adjust with 3 M phosphoric acid to a pH of 2.8.

Solution A: Acetonitrile and *Buffer* (10:90)

Solution B: Acetonitrile and *Buffer* (90:10)

Mobile phase: See *Table 1*.

Table 1

SPECIFIC TESTS

• OPTICAL ROTATION, Specific Rotation (781S)

Sample solution: Prepare a solution of about 240 mg/mL of Phenylephrine Bitartrate in water. Make the solution slightly alkaline by adding concentrated ammonium hydroxide dropwise. Rub the wall of the vessel with a glass rod so that the base precipitates out. Filter the base under suction, wash with a little water and acetone, and dry at 105° for 2 h. Prepare and measure a 50-mg/mL solution of base precipitate in 1 M hydrochloric acid.

Acceptance criteria: −53° to −57°

• pH (791)

Sample solution: 10% w/v aqueous solution

Acceptance criteria: 3.0–4.0

• LOSS ON DRYING (731)

Analysis: Dry at 105° to a constant weight.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE:

Preserve in tight, light-resistant containers. Store at controlled room temperature.

• USP REFERENCE STANDARDS (11)

SPECIFIC TESTS• **OPTICAL ROTATION, Specific Rotation (781S)**

Sample solution: 50 mg/mL in water

Acceptance criteria: -43° to -47°

• **LOSS ON DRYING (731)**

Analysis: Dry at 105° for 2 h.

Acceptance criteria: NMT 1.0%

ADDITIONAL REQUIREMENTS• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at 25° , excursions permitted between 15° and 30° .• **USP REFERENCE STANDARDS (11)**

USP Norphenylephrine Hydrochloride RS
 3-(2-Amino-1-hydroxyethyl)phenol hydrochloride.

$C_8H_{11}NO_2 \cdot HCl$ 189.64

USP Phenylephrine Hydrochloride RS

USP Phenylephrine Related Compound C RS
 1-(3-Hydroxyphenyl)-2-(methylamino)ethan-1-one hydrochloride.

$C_9H_{11}NO_2 \cdot HCl$ 201.65

USP Phenylephrine Related Compound D RS
 (R)-3-[2-[Benzyl(methyl)amino]-1-hydroxyethyl]phenol.

$C_{16}H_{19}NO_2$ 257.33

USP Phenylephrine Related Compound E RS
 2-[Benzyl(methyl)amino]-1-(3-hydroxyphenyl)ethan-1-one hydrochloride.

$C_{16}H_{17}NO_2 \cdot HCl$ 291.77

Phenylephrine Hydrochloride Injection

» Phenylephrine Hydrochloride Injection is a sterile solution of Phenylephrine Hydrochloride in Water for Injection. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of $C_9H_{13}NO_2 \cdot HCl$.

Packaging and storage—Preserve in single-dose or multiple-dose containers, preferably of Type I glass, protected from light.

USP Reference standards (11)—

USP Endotoxin RS

USP Phenylephrine Hydrochloride RS

Identification—Concentrate or dilute, if necessary, a suitable volume of Injection to a concentration of about 10 mg per mL. Apply 2 μ L of this solution and of a Standard solution of USP Phenylephrine Hydrochloride RS, containing about 10 mg per mL, at points about 2.5 cm from the bottom edge of a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel. Dry the spots in a current of warm air, and develop the chromatogram in a suitable chromatographic chamber with a mixture of methanol, water, and ammonium hydroxide (72:25:3) until the solvent front has moved about 12 cm. Dry the plate in warm air, and spray it with alcoholic potassium hydroxide TS. Dry at 60° for 15 minutes, and spray the plate with *p*-nitroaniline TS: the reddish orange spot obtained from the test solution corresponds in color, size, and intensity to that obtained from the Standard solution.

Bacterial Endotoxins Test (85)—It contains not more than 25.0 USP Endotoxin Units per mg of phenylephrine hydrochloride.

pH (791): between 3.0 and 6.5.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—

Mobile phase—Prepare and filter a mixture of methanol and water (1:1) containing 1.1 g of sodium 1-octanesulfonate per liter, adjusted with 3 M phosphoric acid to a pH of 3.0. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Dilution solvent—Prepare a mixture of methanol and water (1:1), adjusted with 3 M phosphoric acid to a pH of 3.0.

System suitability solution—Dissolve about 50 mg each of USP Phenylephrine Hydrochloride RS and USP Epinephrine Bitartrate RS in 5 mL of water, dilute with *Dilution solvent* to 25.0 mL, and mix. Further dilute 5.0 mL of the resulting solution with *Dilution solvent* to 25.0 mL, and mix to obtain a solution having a concentration of about 0.4 mg of phenylephrine hydrochloride and 0.4 mg of epinephrine bitartrate per mL.

Standard preparation—Dissolve about 50 mg of USP Phenylephrine Hydrochloride RS, accurately weighed, in 10 mL of water, dilute with *Dilution solvent* to 25.0 mL, and mix. Further dilute 5.0 mL of the resulting solution with *Dilution solvent* to 25.0 mL, and mix to obtain a solution having a known concentration of about 0.4 mg per mL.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 10 mg of phenylephrine hydrochloride, to a 25-mL volumetric flask. Dilute with *Dilution solvent* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm \times 25-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the responses for the major peaks: the resolution, R , between epinephrine and phenylephrine is not less than 1.0. Chromatograph replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_9H_{13}NO_2 \cdot HCl$ in each mL of the Injection taken by the formula:

$$(25C/V)(r_u/r_s)$$

in which C is the concentration, in mg per mL, of USP Phenylephrine Hydrochloride RS in the *Standard preparation*, V is the volume, in mL, of Injection taken, and r_u and r_s are

the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Phenylephrine Hydrochloride Nasal Jelly

» Phenylephrine Hydrochloride Nasal Jelly contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_9H_{13}NO_2 \cdot HCl$.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Phenylephrine Hydrochloride RS

Identification—Dissolve a suitable quantity in water to obtain a solution having a concentration of about 60 µg per mL, and centrifuge, if necessary: the UV absorption spectrum of the solution so obtained exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Phenylephrine Hydrochloride RS, concomitantly measured.

Minimum fill (755): meets the requirements.

Assay—

Mobile phase—Prepare a mixture of methanol and water (1:1) containing 1.1 g of sodium 1-octanesulfonate per liter, adjust with phosphoric acid to a pH of 3.0, filter, and degas. Make adjustments to the methanol and water ratio, if necessary (see *System Suitability* under *Chromatography* (621)).

Dilution solvent—Prepare a mixture of methanol and water (1:1), and adjust with phosphoric acid to a pH of 3.0.

Standard preparation—Dissolve an accurately weighed quantity of USP Phenylephrine Hydrochloride RS in *Dilution solvent* to obtain a Stock standard solution having a known concentration of about 2 mg per mL. Dilute an accurately measured volume of this solution with *Dilution solvent* to obtain the *Standard preparation* having a known concentration of about 0.1 mg per mL.

Assay preparation—Transfer an accurately weighed amount of Nasal Jelly, equivalent to about 10 mg of phenylephrine hydrochloride, to a 100-mL volumetric flask. Dilute with *Dilution solvent* to volume, and mix.

Resolution solution—Transfer 5.0 mL of Stock standard solution to a 100-mL volumetric flask, add 10 mg of USP Epinephrine Bitartrate RS, dilute with *Dilution solvent* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution*: the resolution, R , is not less than 1.5, and the tailing factor for the phenylephrine peak is not more than 2.0. Chromatograph replicate injections of the *Standard preparation*: the relative standard deviation is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_9H_{13}NO_2 \cdot HCl$ in the portion of Nasal Jelly taken by the formula:

$$100C(r_u / r_s)$$

in which C is the concentration, in mg per mL, of USP Phenylephrine Hydrochloride RS in the *Standard preparation*, and r_u and r_s are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Phenylephrine Hydrochloride Nasal Solution

» Phenylephrine Hydrochloride Nasal Solution contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of $C_9H_{13}NO_2 \cdot HCl$.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Phenylephrine Hydrochloride RS

Identification—It responds to the *Identification* test under *Phenylephrine Hydrochloride Injection*.

Assay—

Mobile phase, *Dilution solvent*, *Standard preparation*, *Resolution solution*, and *Chromatographic system*—Prepare as directed in the *Assay* under *Phenylephrine Hydrochloride Nasal Jelly*.

Assay preparation—Transfer an accurately measured volume of Nasal Solution, equivalent to about 10 mg of phenylephrine hydrochloride, to a 100-mL volumetric flask. Dilute with *Dilution solvent* to volume, and mix.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_9H_{13}NO_2 \cdot HCl$ in each mL of the Nasal Solution taken by the formula:

$$100(C / V)(r_u / r_s)$$

in which C is the concentration, in mg per mL, of USP Phenylephrine Hydrochloride RS in the *Standard preparation*, V is the volume, in mL, of Nasal Solution taken, and r_u and r_s are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Phenylephrine Hydrochloride Ophthalmic Solution

» Phenylephrine Hydrochloride Ophthalmic Solution is a sterile, aqueous solution of Phenylephrine Hydrochloride. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of $C_9H_{13}NO_2 \cdot HCl$. It may contain a suitable antimicrobial agent and buffer and may contain suitable antioxidants.

Packaging and storage—Preserve in tight, light-resistant containers of not more than 15-mL size.

USP Reference standards (11)—

USP Phenylephrine Hydrochloride RS

Identification—It responds to the *Identification* test under *Phenylephrine Hydrochloride Injection*.

Sterility Tests (71): meets the requirements.

pH (791): between 4.0 and 7.5 for buffered Ophthalmic Solution; between 3.0 and 4.5 for unbuffered Ophthalmic Solution.

Assay—

Mobile phase, *Dilution solvent*, *Standard preparation*, *Resolution solution*, and *Chromatographic system*—Prepare as directed in the *Assay* under *Phenylephrine Hydrochloride Nasal Jelly*.

Assay preparation—Transfer an accurately measured volume of Ophthalmic Solution, equivalent to about 10 mg of phenylephrine hydrochloride, to a 100-mL volumetric flask. Dilute with *Dilution solvent* to volume, and mix.

Procedure—Separately inject equal volumes (about 20 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_9H_{13}NO_2 \cdot HCl$ in each mL of Ophthalmic Solution taken by the formula:

$$100(C/V)(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of USP Phenylephrine Hydrochloride RS in the *Standard preparation*, *V* is the volume, in mL, of Ophthalmic Solution taken, and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Phenylephrine Hydrochloride Tablets

DEFINITION

Phenylephrine Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of phenylephrine hydrochloride ($C_9H_{13}NO_2 \cdot HCl$).

IDENTIFICATION

- **A.** The UV absorption spectra of the phenylephrine peak of the *Sample solution* and that of the *Standard solution* exhibit maxima and minima at the same wavelengths, as obtained in the *Assay*.
- **B.** The retention time of the phenylephrine peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

It is suggested to use plastic vials for analysis.

Buffer: 3.45 g/L of monobasic ammonium phosphate in water. Adjust with 10% phosphoric acid or 10% ammonium hydroxide solution to a pH of 4.5 ± 0.10 , if necessary.

Solution A: Dilute 10 mL of glacial acetic acid with water to 1000 mL.

Mobile phase: Acetonitrile and *Buffer* (35:65)

Diluent: Methanol and *Solution A* (30:70)

Standard solution: 0.1 mg/mL of USP Phenylephrine Hydrochloride RS in *Diluent*

Sample solution: Nominally 0.1 mg/mL of phenylephrine hydrochloride prepared as follows. Transfer NLT 10 Tablets to a suitable volumetric flask, add 50% of the final volume of *Solution A*, and stir vigorously for NLT 30 min. Add 30% of the final volume of methanol and stir for NLT an additional 90 min. To ensure that particles do not collect above the solvent level, periodically rinse the particulate into the solution with *Solution A*. Allow the resulting solution to cool to room temperature and dilute with *Solution A* to volume. Pass a portion through a suitable filter of 0.45- μ m pore size. Discard the first 2–3 mL of filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 214 nm. For *Identification A*, use a diode-array detector in the range of 200–350 nm.

Column: 4.6-mm \times 10-cm; 5- μ m packing L9

Flow rate: 2.0 mL/min

Injection volume: 25 μ L

Run time: NLT 1.75 times the retention time of phenylephrine

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: 0.5–3.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of phenylephrine hydrochloride ($C_9H_{13}NO_2 \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of phenylephrine from the *Sample solution*

r_S = peak response of phenylephrine from the *Standard solution*

C_S = concentration of USP Phenylephrine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of phenylephrine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

DISSOLUTION (711)

It is suggested to use plastic vials for analysis.

Medium: Simulated gastric fluid without pepsin; 900 mL

Apparatus 2: 50 rpm

Time: 45 min

Buffer, Mobile phase, and System suitability: Proceed as directed in the *Assay*.

Standard solution: ($L/900$) mg/mL of USP Phenylephrine Hydrochloride RS in *Medium*, where *L* is the label claim of phenylephrine hydrochloride in mg/Tablet

Sample solution: Pass a portion of the solution under test through a suitable filter of 10–20- μ m pore size.

Chromatographic system: Proceed as directed in the *Assay*, except for the following.

Injection volume: 100 μ L

Run time: NLT 1.5 times the retention time of phenylephrine

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of phenylephrine hydrochloride ($C_9H_{13}NO_2 \cdot HCl$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U = peak response of phenylephrine from the *Sample solution*

r_S = peak response of phenylephrine from the *Standard solution*

C_S = concentration of USP Phenylephrine Hydrochloride RS in the *Standard solution* (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

Tolerances: NLT 75% (*Q*) of the labeled amount of phenylephrine hydrochloride ($C_9H_{13}NO_2 \cdot HCl$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES

ORGANIC IMPURITIES

Solution A: Trifluoroacetic acid and water (1:1000)

Solution B: Trifluoroacetic acid and acetonitrile (1:1000)

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	96.5	3.5
3	96.5	3.5
44	62.0	38.0
45	96.5	3.5
50	96.5	3.5

Diluent: Phosphoric acid and water (0.5:1000)

System suitability solution: 0.0002 mg/mL of USP Phenylephrine Related Compound F RS, 0.0002 mg/mL of USP Phenylephrine Related Compound G RS, and 0.2 mg/mL of USP Phenylephrine Hydrochloride RS in *Diluent*

Standard solution: 0.002 mg/mL of USP Phenylephrine Hydrochloride RS in *Diluent*

Sensitivity solution: 0.0002 mg/mL of USP Phenylephrine Hydrochloride RS in *Diluent* from the *Standard solution*

Sample solution: Nominally 0.2 mg/mL of phenylephrine hydrochloride prepared as follows. Transfer NLT 10 Tablets to a suitable volumetric flask, add about 50% of the final volume of *Diluent*, and shake for NLT 1 h. Dilute with *Diluent* to volume. Pass a portion through a suitable filter of 0.45- μ m pore size. Discard the first 2 mL of filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 270 nm

Column: 4.6-mm \times 15-cm; 3.5- μ m packing L1

Column temperature: 35.0°

Flow rate: 1.2 mL/min

Injection volume: 50 μ L

System suitability

Samples: *System suitability solution*, *Standard solution*, and *Sensitivity solution*

Suitability requirements

Resolution: NLT 1.0 between phenylephrine related compound G and phenylephrine, *System suitability solution*

Relative standard deviation: NMT 6.0%, *Standard solution*

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of any individual degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each individual degradation product from the *Sample solution*

r_S = peak response of phenylephrine from the *Standard solution*

C_S = concentration of USP Phenylephrine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of phenylephrine hydrochloride in the *Sample solution* (mg/mL)

F = relative response factor of each individual degradation product (see Table 2)

Acceptance criteria: See Table 2. Disregard any peaks below 0.1%.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)

IDENTIFICATION• **A. INFRARED ABSORPTION** (197F)**IMPURITIES**• **RESIDUE ON IGNITION** (281)

Sample: 10 mL

Analysis: Evaporate the *Sample* in a suitable crucible, and ignite to constant weight.

Acceptance criteria: NMT 0.005%

SPECIFIC TESTS• **SPECIFIC GRAVITY** (841): 1.017–1.020• **REFRACTIVE INDEX** (831): 1.531–1.534 at 20°• **CHLORINATED COMPOUNDS**

Sample: 2 drops

Analysis: Wind a 1.5- × 5-cm strip of 20-mesh copper gauze around the end of a copper wire. Heat the gauze in the nonluminous flame of a Bunsen burner until it glows without coloring the flame green. Permit the gauze to cool, and heat several times until a good coat of oxide has formed. Apply the *Sample* to the cooled gauze with a medicine dropper, ignite, and permit it to burn freely in the air. Again cool the gauze, add a second *Sample*, and burn as before. Continue this process until a total of 6 drops has been added and ignited, and then hold the gauze in the outer edge of the Bunsen flame, adjusted to a height of about 4 cm.

Acceptance criteria: No transient green color or other color is imparted to the flame.

• **ALDEHYDE**

Sample: 5 mL

Analysis: Shake the *Sample* with 5 mL of 1 N sodium hydroxide, and allow to stand for 1 h.

Acceptance criteria: No yellow color appears in the organic (top) layer.

ADDITIONAL REQUIREMENTS• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store in a cool, dry place.• **USP REFERENCE STANDARDS** (11)

Phenylpropanolamine Hydrochloride $C_9H_{13}NO \cdot HCl$

187.67

Benzenemethanol, α -(1-aminoethyl)-, hydrochloride, (*R*,S**)-, (\pm);(\pm)-Norephedrine hydrochloride [154-41-6].**DEFINITION**

Phenylpropanolamine Hydrochloride contains NLT 98.0% and NMT 101.0% of phenylpropanolamine hydrochloride ($C_9H_{13}NO \cdot HCl$), calculated on the dried basis.

IDENTIFICATION• **A. INFRARED ABSORPTION** (197K)• **B. ULTRAVIOLET ABSORPTION** (197U)Solution: 500 μ g/mL

Medium: Water

Analytical wavelength: 256 nm

Acceptance criteria: Absorptivities, calculated on the dried basis, do not differ by more than 3.0%.

• **C. MELTING RANGE OR TEMPERATURE** (741)

Sample: Dissolve 1 g in 10 mL of water, add 10 mL of saturated sodium carbonate solution, and mix. Separate the precipitate by vacuum filtration, using a sintered-

glass filter of medium pore size. Wash with three 5-mL portions of ice-cold water. Dry the crystals at 80° for 1 h.

Acceptance criteria: The *Sample* melts between 101° and 104°.**ASSAY**• **PROCEDURE**

Sample: 500 mg

Analysis: Dissolve the *Sample* in 50 mL of glacial acetic acid. Add 10 mL of mercuric acetate TS and 2 drops of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 18.77 mg of phenylpropanolamine hydrochloride ($C_9H_{13}NO \cdot HCl$).

Acceptance criteria: 98.0%–101.0% on the dried basis

IMPURITIES• **RESIDUE ON IGNITION** (281): NMT 0.1%**Delete the following:**• **HEAVY METALS, Method I** (231)

Sample solution: Dissolve 1 g in 5 mL of water, add 1 mL of 1 N acetic acid, and dilute with water to 25 mL.

Acceptance criteria: NMT 0.002% (Official 1-Jan-2018)

• **LIMIT OF CATHINONE HYDROCHLORIDE**

Diluent: Dilute hydrochloric acid (1 in 120)

Standard solution: 100 μ g/mL of USP Cathinone Hydrochloride RS in *Diluent*Sample solution: 100 mg/mL of Phenylpropanolamine Hydrochloride in *Diluent***Instrumental conditions**

Mode: UV

Analytical wavelength: Maximum absorbance at about 285 nm

Cell: 1 cm

Blank: *Diluent*

Analysis: Concomitantly determine the absorbances of the *Sample solution* and the *Standard solution*, using the *Blank*.

Acceptance criteria: The absorbance of the *Sample solution* is NMT than that of the *Standard solution* (NMT 0.10%).

• **LIMIT OF AMPHETAMINE HYDROCHLORIDE**

Mobile phase: Acetonitrile, phosphoric acid, triethylamine, and water (50:8:5:950)

System suitability solution: 5 μ g/mL each of USP Phenylpropanolamine Hydrochloride RS and USP Dextroamphetamine Sulfate RS in water

Sample stock solution: 250 mg/mL of Phenylpropanolamine Hydrochloride in water. Sonicate if necessary.

Sample solution: 100 mg/mL of Phenylpropanolamine Hydrochloride in water from *Sample stock solution*Amphetamine standard stock solution: 2.5 μ g/mL of USP Dextroamphetamine Sulfate RS in water

Standard solution: 1 μ g/mL of USP Dextroamphetamine Sulfate RS and 100 mg/mL of Phenylpropanolamine Hydrochloride in water from *Amphetamine standard stock solution* and *Sample stock solution*

Chromatographic system(See *Chromatography* (621), *System Suitability*.)

USP Phenyltoloxamine Related Compound A RS

2-(2-Benzylphenoxy)ethylmethylamine hydrochloride.

$C_{16}H_{19}NO \cdot HCl$ 277.79

Identification, Infrared Absorption (197K).

Melting range, Class 1a (741): between 137° and 143°.

pH (791): between 3.2 and 4.2, in a solution (1 in 100).

Loss on drying (731)—Dry it in vacuum at 80° for 3 hours; it loses not more than 0.5% of its weight.

Residue on ignition (281): not more than 0.1%.

Delete the following:

• **Heavy metals, Method I (231):** 20 μg per g. • (Official 1-Jan-2018)

Related compounds—

Resolution solution—In a separatory funnel dissolve about 10 mg each of USP Phenyltoloxamine Citrate RS and USP Phenyltoloxamine Related Compound A RS, accurately weighed, in 50 mL of water. Add 5 mL of ammonium hydroxide, and extract with three 10-mL portions of methylene chloride. Combine the extracts, dry the solution over anhydrous sodium sulfate, and gently evaporate to dryness. Dissolve the residue in 20 mL of methylene chloride.

Test solution—In a separatory funnel dissolve about 400 mg of Phenyltoloxamine Citrate, accurately weighed, in 50 mL of water. Proceed as directed for *Resolution solution*, beginning with "Add 5 mL of ammonium hydroxide."

Chromatographic system (see Chromatography (621))—The gas chromatograph is equipped with a split injection system, a flame-ionization detector, and a 0.32-mm × 25-m column coated with a 0.45-μm film of phase G27. The carrier gas is helium, flowing at a rate of about 29 cm per second, with a split flow rate of about 25 mL per minute. The column temperature is programmed as follows. Initially the temperature of the column is equilibrated at 190° for 3 minutes, then the temperature is increased at a rate of 4° per minute to 240°, and maintained at 240° for 8 minutes. The injection port and the detector temperatures are maintained at 280°. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution, R , between phenyltoloxamine and phenyltoloxamine related compound A is not less than 1.5.

Procedure—Inject a volume (about 1 μL) of the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Phenyltoloxamine Citrate taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response of each impurity; and r_s is the sum of the responses of all the peaks, excluding the solvent peaks: not more than 0.2% of phenyltoloxamine related compound A; not more than 0.1% of any other individual impurity; and not more than 1.0% of total impurities is found.

Assay—Dissolve about 0.5 g of Phenyltoloxamine Citrate, accurately weighed, in 80 mL of glacial acetic acid, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction (see *Titrimetry* (541)). Each mL of 0.1 N perchloric acid is equivalent to 44.75 mg of $C_{17}H_{21}NO \cdot C_6H_8O_7$.

Phenytoin

C₁₅H₁₂N₂O₂

252.27

2,4-Imidazolidinedione, 5,5-diphenyl-;
5,5-Diphenylhydantoin [57-41-0].

DEFINITION

Phenytoin contains NLT 98.0% and NMT 102.0% of phenytoin (C₁₅H₁₂N₂O₂), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (17K)**
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Solution A: Prepare a 0.05 M monobasic potassium phosphate solution and adjust with phosphoric acid to a pH of 2.5.

Solution B: Methanol and acetonitrile (60:40)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	60	40
23	60	40
38	42	58
45	30	70
50	30	70
51	60	40
55	60	40

Diluent: *Solution B* and water (1:1)

Standard solution: 0.2 mg/mL of USP Phenytoin RS in *Diluent*. Dissolve with the aid of sonication if necessary.

Sample solution: 0.2 mg/mL of Phenytoin in *Diluent*. Dissolve with the aid of sonication if necessary.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

C₁₅H₁₄N₂O₃ 270.28**Phenytoin Oral Suspension****DEFINITION**

Phenytoin Oral Suspension is Phenytoin suspended in a suitable medium. It contains NLT 95.0% and NMT 105.0% of the labeled amount of phenytoin (C₁₅H₁₂N₂O₂).

IDENTIFICATION• **A. INFRARED ABSORPTION** (197K)

Sample: Shake a volume of Oral Suspension equivalent to 100 mg of phenytoin with 50 mL of a mixture of ether and chloroform (1 in 2) in a separator, evaporate the extract to dryness, and dry under vacuum at 105° for 4 h. Weigh 2–4 mg of the residue and 200 mg of potassium bromide in a mortar. Pestle, mix, and grind well, and prepare the potassium bromide pellet.

Acceptance criteria: Meets the requirements

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.**ASSAY**• **PROCEDURE**

Solution A: Prepare a 0.05 M monobasic potassium phosphate solution, and adjust with phosphoric acid to a pH of 2.5.

Solution B: Methanol and acetonitrile (60:40)

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	60	40
23	60	40
38	42	58
45	30	70
50	30	70
51	60	40
55	60	40

Diluent: *Solution B* and water (1:1)

Standard solution: 0.2 mg/mL of USP Phenytoin RS in *Diluent*. Dissolve with the aid of sonication, if necessary.

Sample solution: Nominally 0.2 mg/mL of phenytoin prepared as follows. Weigh and transfer a suitable volume of Oral Suspension containing the equivalent of 20 mg of phenytoin to a 100-mL volumetric flask. Add 20 mL of methanol, and dissolve. Dilute with *Diluent* to volume. Dissolve with the aid of sonication, if necessary.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 15-cm; 3-μm packing L1

Flow rate: 1 mL/min

Injection volume: 20 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 0.73%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of phenytoin (C₁₅H₁₂N₂O₂) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Phenytoin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of phenytoin in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS• **DISSOLUTION** (711)

Buffer 1: Dissolve 36.3 g of tris(hydroxymethyl)amino-methane and 60 g of sodium lauryl sulfate in 6 L of water, adjust with hydrochloric acid to a pH of 7.5, and degas.

Medium: *Buffer 1*; 900 mL

Apparatus 2: 35 rpm

Time: 60 min

Buffer 2: 2.76 g/L of monobasic sodium phosphate in water

Mobile phase: Methanol, acetonitrile, and *Buffer 2* (27:23:50). Adjust with phosphoric acid to a pH of 3.0.

Standard solution: 0.14 mg/mL of USP Phenytoin RS prepared as follows. Transfer a suitable amount of USP Phenytoin RS to a suitable volumetric flask. Dissolve in 3% of the flask volume of methanol. Dilute with *Medium* to volume.

Sample solution: Shake the sample suspension well (100 shakes). Determine the density, d (g/mL), of Oral Suspension using appropriate means. Using a 5-mL syringe, collect approximately 5 mL of Oral Suspension, and record the weight. With the paddles lowered, gently empty the contents of each syringe into the bottom of each vessel containing *Medium*. Start rotating the paddles. Reweigh each syringe, and determine the weight (g) of Oral Suspension delivered into each vessel. At the end of 60 min, remove 4 mL from each vessel, and pass through a nylon filter of 0.45-μm pore size, presaturated with *Medium*. [NOTE—Dilute with *Medium* if necessary to a concentration that is similar to the *Standard solution*.]

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at controlled room temperature. Protect from moisture.
- **LABELING:** Label the Tablets to indicate that they are to be chewed.
- **USP REFERENCE STANDARDS (11)**
USP Phenytoin RS

Phenytoin Sodium

C₁₅H₁₁N₂NaO₂ 274.25
2,4-Imidazolidinedione, 5,5-diphenyl-, monosodium salt;
5,5-Diphenylhydantoin sodium salt [630-93-3].

DEFINITION

Phenytoin Sodium contains NLT 98.0% and NMT 102.0% of phenytoin sodium (C₁₅H₁₁N₂NaO₂), calculated on the dried basis.

IDENTIFICATION**• A. INFRARED ABSORPTION (197K)****• B. IDENTIFICATION TESTS—GENERAL, Sodium (191)**

Solution A: Dissolve 2.7 g of methoxyphenylacetic acid in 6 mL of tetramethylammonium hydroxide solution, and add 20 mL of dehydrated alcohol.

Solution B: 158 mg/mL of ammonium carbonate in water

Sample solution: Ignite 1 g, and cool. Add 2 mL of water to the residue, and neutralize the solution with hydrochloric acid. Filter, and dilute the filtrate with water to 4 mL.

Analysis: To 0.1 mL of the *Sample solution* add 1.5 mL of *Solution A*, and cool in ice water for 30 min. A voluminous, white, crystalline precipitate is formed. Place in water at 20°, and stir for 5 min.

Acceptance criteria: The precipitate does not disappear. Add 1 mL of ammonia TS. The precipitate dissolves completely. Add 1 mL of *Solution B*. No precipitate is formed.

- **C.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY**• PROCEDURE**

Buffer: 0.05 M monobasic ammonium phosphate buffer, adjusted with phosphoric acid to a pH of 2.5

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of phenytoin sodium ($C_{15}H_{11}N_2NaO_2$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times (M_{r1}/M_{r2}) \times V \times (100/L)$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Phenytoin RS in the *Standard solution* (mg/mL)

M_{r1} = molecular weight of phenytoin sodium, 274.25

M_{r2} = molecular weight of phenytoin, 252.27

V = volume of *Medium*, 900 mL

L = label claim (mg/Capsule)

Tolerances (for products labeled as 30-mg Capsules)

The percentage of the labeled amount of phenytoin sodium ($C_{15}H_{11}N_2NaO_2$) dissolved is NMT 40% (Q) in 30 min, 56% (Q') in 60 min, and NLT 65% (Q'') in 120 min. The requirements are met if the quantities dissolved from the Capsules tested conform to *Table 1*.

Table 1

Stage	Number Tested	Acceptance Criteria
S_1	6	Each unit is within the range between $Q - 15\%$ and $Q - 5\%$, is within the range $Q' \pm 10\%$, and is NLT $Q'' + 5\%$ at the stated <i>Times</i> .
S_2	6	Average of 12 units ($S_1 + S_2$) is within the range between $Q - 10\%$ and Q , is within the range $Q' \pm 8\%$, and is NLT Q'' ; no unit is outside the range between $Q - 20\%$ and $Q + 10\%$, no unit is outside the range $Q' \pm 18\%$, and no unit is less than $Q'' - 10\%$ at the stated <i>Times</i> .
S_3	12	Average of 24 units ($S_1 + S_2 + S_3$) is within the range between $Q - 10\%$ and Q , is within the range $Q' \pm 8\%$, and is NLT Q'' ; NMT 2 units are outside the range between $Q - 20\%$ and $Q + 10\%$, and no unit is outside the range $Q - 30\%$ and $Q + 20\%$; NMT 2 units are outside the range $Q' \pm 18\%$, and no unit is outside the range $Q' \pm 25\%$; NMT 2 units are less than $Q'' - 10\%$, and no unit is less than $Q'' - 20\%$ at the stated <i>Times</i> .

Tolerances (for products labeled as 100-mg Capsules)

The percentage of the labeled amount of phenytoin sodium ($C_{15}H_{11}N_2NaO_2$) dissolved is NMT 45% (Q) in 30 min, 60% (Q') in 60 min, and NLT 70% (Q'') in 120 min. The requirements are met if the quantities dissolved from the Capsules tested conform to *Table 2*.

Table 2

Stage	Number Tested	Acceptance Criteria
S_1	6	Each unit is within the range between $Q - 25\%$ and $Q - 5\%$, is equal to $Q' \pm 20\%$, and is NLT $Q'' + 5\%$ at the stated Times.
S_2	6	Average of 12 units ($S_1 + S_2$) is within the range between $Q - 20\%$ and Q , is within the range $Q' \pm 15\%$, and is NLT Q'' ; no unit is outside the range between $Q - 30\%$ and $Q + 10\%$, no unit is outside the range $Q' \pm 25\%$, and no unit is less than $Q'' - 10\%$ at the stated Times.
S_3	12	Average of 24 units ($S_1 + S_2 + S_3$) is within the range between $Q - 20\%$ and Q , is within the range $Q' \pm 15\%$, and is NLT Q'' ; NMT 2 units are outside the range between $Q - 30\%$ and $Q + 10\%$, and no unit is outside the range between $Q - 40\%$ and $Q + 20\%$; NMT 2 units are outside the range $Q' \pm 25\%$, and no unit is outside the range $Q' \pm 35\%$; NMT 2 units are less than $Q'' - 10\%$, and no unit is less than $Q'' - 20\%$ at the stated Times.

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Proceed as directed in *Test 1*, except use *Apparatus 1* at 75 rpm and the following *Tolerances*.

Tolerances (for products labeled as 100-mg Capsules)

The percentage of the labeled amount of phenytoin sodium ($C_{15}H_{11}N_2NaO_2$) dissolved is NMT 45% (Q) in 30 min, 65% (Q') in 60 min, and NLT 70% (Q'') in 120 min. The requirements are met if the quantities dissolved from the Capsules tested conform to *Table 3*.

Table 3

Stage	Number Tested	Acceptance Criteria
S_1	6	Each unit is within the range between $Q - 25\%$ and $Q - 5\%$, is equal to $Q' \pm 20\%$, and is NLT $Q'' + 5\%$ at the stated Times.
S_2	6	Average of 12 units ($S_1 + S_2$) is within the range between $Q - 25\%$ and $Q - 5\%$, is within the range of $Q' - 20\%$ and $Q' + 10\%$, and is NLT Q'' ; no unit is outside the range between $Q - 30\%$ and $Q + 5\%$, no unit is outside the range $Q' - 25\%$ and $Q' + 20\%$, and no unit is less than $Q'' - 10\%$ at the stated Times.
S_3	12	Average of 24 units ($S_1 + S_2 + S_3$) is within the range between $Q - 25\%$ and $Q - 5\%$, is within the range of $Q' - 20\%$ and $Q' + 10\%$, and is NLT Q'' ; NMT 2 units are outside the range between $Q - 30\%$ and $Q + 5\%$; and no unit is outside the range of $Q - 40\%$ and $Q + 15\%$; NMT 2 units are outside the range $Q' - 25\%$ and $Q' + 20\%$, and no unit is outside the range $Q' - 35\%$ and $Q' + 25\%$; NMT 2 units are less than $Q'' - 10\%$; and no unit is less than $Q'' - 20\%$ at the stated Times.

Test 3: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Medium: Water; 900 mL

Apparatus 1: 75 rpm

Times: 30, 60, and 120 min

Determine the amount of phenytoin sodium

($C_{15}H_{11}N_2NaO_2$) dissolved by using the method described in *Test 1*.

Tolerances (for products labeled as 200- and 300-mg Capsules)

The percentage of the labeled amount of phenytoin sodium ($C_{15}H_{11}N_2NaO_2$) dissolved is NMT 30% (Q) in 30 min, 50% (Q') in 60 min, and NLT 60% (Q'') in 120 min. The requirements are met if the quantities dissolved from the Capsules tested conform to *Table 4*.

Table 4

Stage	Number Tested	Acceptance Criteria
S_1	6	Each unit is within the range between $Q - 20\%$ and $Q + 5\%$, is equal to $Q' - 20\%$ and $Q' + 25\%$, and is NLT $Q'' + 5\%$ at the stated Times.
S_2	6	Average of 12 units ($S_1 + S_2$) is within the range between $Q - 20\%$ and Q , is within the range of $Q' \pm 20\%$, and is NLT Q'' ; no unit is outside the range between $Q - 25\%$ and $Q + 10\%$, no unit is outside the range $Q' \pm 25\%$, and no unit is less than $Q'' - 10\%$ at the stated Times.
S_3	12	Average of 24 units ($S_1 + S_2 + S_3$) is within the range between $Q - 20\%$ and Q , is within the range of $Q' \pm 20\%$, and is NLT Q'' ; NMT 2 units are outside the range between $Q - 25\%$ and $Q + 10\%$, and no unit is outside the range $Q - 25\%$ and $Q + 15\%$; NMT 2 units are outside the range $Q' \pm 25\%$; and no unit is outside the range $Q' \pm 30\%$; NMT 2 units are less than $Q'' - 10\%$; and no unit is less than $Q'' - 20\%$ at the stated Times.

Test 4: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.

Medium, Apparatus 1, Times, and Analysis: Proceed as directed for *Test 1*.

Tolerances (for products labeled as 30-mg Capsules):

The percentage of the labeled amount of phenytoin sodium ($C_{15}H_{11}N_2NaO_2$) dissolved is NMT 40% (Q) in 30 min, 56% (Q') in 60 min, and NLT 65% (Q'') in 120 min. The requirements are met if the quantities dissolved from the Capsules tested conform to *Table 5*.

Table 5

Stage	Number Tested	Acceptance Criteria
S_1	6	Each unit is within the range between $Q - 10\%$ and Q , is within the range $Q' - 9\%$ and $Q' + 7\%$, and is NLT $Q'' + 5\%$ at the stated Times.
S_2	6	Average of 12 units ($S_1 + S_2$) is within the range between $Q - 8\%$ and $Q + 2\%$, is within the range $Q' - 9\%$ and $Q' + 7\%$, and is NLT Q'' ; no unit is outside the range between $Q - 20\%$ and $Q + 10\%$, no unit is outside the range $Q' - 19\%$ and $Q' + 17\%$, and no unit is less than $Q'' - 10\%$ at the stated Times.
S_3	12	Average of 24 units ($S_1 + S_2 + S_3$) is within the range between $Q - 8\%$ and $Q + 2\%$, is within the range $Q' - 9\%$ and $Q' + 7\%$, and is NLT Q'' ; NMT 2 units are outside the range between $Q - 20\%$ and $Q + 10\%$, and no unit is outside the range $Q - 30\%$ and $Q + 20\%$; NMT 2 units are outside the range $Q' - 19\%$ and $Q' + 17\%$, and no unit is outside the range $Q' - 26\%$ and $Q' + 24\%$; NMT 2 units are less than $Q'' - 10\%$, and no unit is less than $Q'' - 20\%$ at the stated Times.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES• **ORGANIC IMPURITIES**

Buffer, Mobile phase, Sample solution, and Chromatographic system: Proceed as directed in the Assay.

Standard solution: 600 µg/mL of USP Phenytoin RS, 3 µg/mL of USP Phenytoin Related Compound A RS, and 3 µg/mL of USP Phenytoin Related Compound B RS in methanol

System suitability

Sample: Standard solution

[NOTE—The relative retention times for phenytoin related compound A, phenytoin related compound B, and phenytoin are 0.38, 0.45, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 8 between phenytoin related compound B and phenytoin; NLT 1.5 between phenytoin related compound A and phenytoin related compound B

Tailing factor: NMT 2.0 for the phenytoin peak

Relative standard deviation: NMT 2.0% for phenytoin; NMT 5.0% for phenytoin related compound A or phenytoin related compound B

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of each phenytoin related compound in the portion of Capsules taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response of phenytoin related compound A or phenytoin related compound B from the Sample solution

r_s = peak response of phenytoin related compound A or phenytoin related compound B from the Standard solution

C_s = concentration of the corresponding analyte in the Standard solution (µg/mL)

C_u = nominal concentration of phenytoin in the Sample solution (µg/mL)

Calculate the percentage of any individual unspecified degradation product in the portion of Capsules taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response of each unspecified degradation product from the Sample solution

r_s = peak response of phenytoin from the Standard solution

C_s = concentration of USP Phenytoin RS in the Standard solution (µg/mL)

C_u = nominal concentration of phenytoin in the Sample solution (µg/mL)

Acceptance criteria: See Table 6.

Table 6

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Phenytoin related compound A	0.38	0.5
Phenytoin related compound B	0.45	1.0
Phenytoin	1.0	—
Any individual, unspecified degradation product	—	0.2

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Protect from moisture. Store at controlled room temperature.
- **LABELING:** When more than one Dissolution test is given, the labeling states the Dissolution test used only if Test 1 is not used.
- **USP REFERENCE STANDARDS (11)**
 - USP Phenytoin RS
 - USP Phenytoin Related Compound A RS
 - Diphenylglycine.
 - $C_{14}H_{13}NO_2$ 227.26
 - USP Phenytoin Related Compound B RS
 - Diphenylhydantoic acid.
 - $C_{15}H_{14}N_2O_3$ 270.29

Delete the following:

▲ Prompt Phenytoin Sodium Capsules

» Prompt Phenytoin Sodium Capsules contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{15}H_{11}N_2NaO_2$.

Packaging and storage—Preserve in tight containers.

Labeling—Label the Capsules with the statement "Not for once-a-day dosing," printed immediately under the official name, in a bold and contrasting color and/or enclosed within a box.

USP Reference standards (11)—

USP Phenytoin RS

USP Phenytoin Sodium RS

Identification—

A: The contents of Capsules respond to Identification test A under Phenytoin Sodium.

B: The contents of Capsules respond to the flame test for Sodium (191).

Dissolution (711)—

Medium: water; 900 mL.

Apparatus 1: 50 rpm.

Time: 30 minutes.

Procedure—Determine the amount of $C_{15}H_{11}N_2NaO_2$ dissolved by measuring the UV absorbance at 258 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium* if necessary, in comparison with a *Standard solution* having a known concentration of *USP Phenytoin Sodium RS* in the same *Medium*.

Tolerances—Not less than 85% (Q) of the labeled amount of $C_{15}H_{11}N_2NaO_2$ is dissolved in 30 minutes.

Uniformity of dosage units (905): meet the requirements.

Procedure for content uniformity—Proceed as directed in the test for *Uniformity of dosage units* under *Extended Phenytoin Sodium Capsules*.

Assay—Proceed with Capsules as directed in the *Assay* under *Extended Phenytoin Sodium Capsules*. Δ_{USP40}

Phenytoin Sodium Injection

DEFINITION

Phenytoin Sodium Injection is a sterile solution of Phenytoin Sodium with Propylene Glycol and Alcohol in Water for Injection. It contains NLT 95.0% and NMT 105.0% of the labeled amount of phenytoin sodium ($C_{15}H_{11}N_2NaO_2$).

IDENTIFICATION• **A. INFRARED ABSORPTION** (197K)

Sample: Transfer an equivalent of 250 mg of phenytoin sodium from a volume of Injection to a separator containing 25 mL of water. Extract first with 50 mL of ethyl acetate and then with two additional 30-mL portions of ethyl acetate. Wash each extract with two 20-mL portions of sodium acetate solution (10 mg/mL). Evaporate the combined ethyl acetate extracts, and dry the residue of phenytoin at 105° to constant weight.

Acceptance criteria: Residue obtained from the *Sample* meets the requirements.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **PROCEDURE**

Mobile phase: Methanol and water (55:45)

Standard solution: 0.23 mg/mL of *USP Phenytoin RS* in *Mobile phase*

Sample solution: Nominally 0.25 mg/mL of phenytoin sodium from a volume of Injection equivalent to 250 mg of phenytoin sodium in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm × 25-cm; packing L1

Flow rate: 1.5 mL/min

Injection volume: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of phenytoin sodium ($C_{15}H_{11}N_2NaO_2$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of *USP Phenytoin RS* in the *Standard solution* (mg/mL)

C_U = nominal concentration of phenytoin sodium in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of phenytoin sodium, 274.25

M_{r2} = molecular weight of phenytoin, 252.27

Acceptance criteria: 95.0%–105.0%

OTHER COMPONENTS• **ALCOHOL AND PROPYLENE GLYCOL CONTENT**

Internal standard solution: 0.02 mL/mL of methanol and 0.04 mL/mL of ethylene glycol in water

Standard stock solution: 0.01 mL/mL of alcohol from *USP Alcohol Determination—Alcohol RS* and 0.04 mL/mL of *USP Propylene Glycol RS* in water

Standard solution: 0.005 mL/mL of alcohol and 0.02 mL/mL of propylene glycol prepared as follows. Pipet 5 mL each of *Standard stock solution* and *Internal standard solution* into a 10-mL volumetric flask.

Sample solution: 0.05 mL/mL of Injection in water prepared as follows. Pipet 5 mL of Injection and 50 mL of the *Internal standard solution* into a 100-mL volumetric flask, and dilute with water to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 30-m × 0.53-mm (ID) capillary column with a 1-µm coating of G16 phase

Temperatures

Injection port: 240°

Detector: 250°

Column: See Table 1.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
50	0	50	4
50	15	230	5

Carrier gas: Hydrogen or helium

Flow rate: 5 mL/min

Injection volume: 0.2 µL

Injection type: Split ratio, 10:1

System suitability

Sample: *Standard solution*

[NOTE—See Table 2 for the relative retention times.]

Suitability requirements

Resolution: NLT 5.0 between methanol and alcohol; NLT 5.0 between propylene glycol and ethylene glycol

Relative standard deviation: NMT 2.0% for each of the response ratios of alcohol to methanol and propylene glycol to ethylene glycol

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the alcohol content, as a percentage, in the portion of Injection taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of alcohol to methanol from the *Sample solution*

R_S = peak response ratio of alcohol to methanol from the *Standard solution*

C_S = concentration of alcohol in the *Standard solution* (mL/mL)

C_U = nominal concentration of the Injection in the *Sample solution* (mL/mL)

Calculate the propylene glycol content, as a percentage, in the portion of Injection taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of propylene glycol to ethylene glycol from the *Sample solution*

R_S = peak response ratio of propylene glycol to ethylene glycol from the *Standard solution*

C_S = concentration of propylene glycol in the *Standard solution* (mL/mL)

C_U = nominal concentration of the Injection in the *Sample solution* (mL/mL)

Acceptance criteria: See Table 2.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Methanol*	0.27	—
Alcohol	0.32	9.0–11.0
Propylene glycol	0.98	37.0–43.0
Ethylene glycol*	1.0	—

* Internal standard included for peak identification purposes only.

SPECIFIC TESTS

- BACTERIAL ENDOTOXINS TEST (85):** It contains NMT 0.3 USP Endotoxin Unit/mg of phenytoin sodium.
- pH (791):** 10.0–12.3
- PARTICULATE MATTER IN INJECTIONS (788):** It meets the requirements under small-volume injections.
- OTHER REQUIREMENTS:** It meets the requirements under *Injections and Implanted Drug Products (1)*.

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in single-dose or multiple-dose containers, preferably of Type I glass, at controlled room temperature.
- LABELING:** The label states the following: "Do not use the Injection if it is hazy or contains a precipitate."
- USP REFERENCE STANDARDS (11)**
 - USP Alcohol Determination—Alcohol RS
 - USP Endotoxin RS
 - USP Phenytoin RS
 - USP Propylene Glycol RS

Chromic Phosphate P 32 Suspension

» Chromic Phosphate P 32 Suspension is a sterile, aqueous suspension of radioactive chromic phos-

phate P 32 in a 30 percent Dextrose solution suitable for intraperitoneal, intrapleural, or interstitial administration. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ^{32}P as chromic phosphate expressed in megabecquerels (millicuries) per mL at the time indicated in the labeling. It may contain a preservative or a stabilizer. Other chemical forms of radioactivity do not exceed 5.0 percent of the total radioactivity.

Packaging and storage—Preserve in single-dose or multiple-dose containers.

Labeling—Label it to include the following, in addition to the information specified *Labeling (7)*, *Labels and Labeling for Injectable Products*: the time and date of calibration; the amount of ^{32}P as labeled chromic phosphate expressed as total megabecquerels (millicuries) and concentration as megabecquerels (millicuries) per mL at the time of calibration; the expiration date; and the statements, "Caution—Radioactive Material," and "For intracavitary use only." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of ^{32}P is 14.3 days.

USP Reference standards (11)—

USP Endotoxin RS

Radionuclide identification—

A: The beta radiation of the Suspension, measured according to the procedure set forth under *Radioactivity (821)*, shows a mass absorption coefficient within $\pm 5\%$ of the value found for a specimen of a known standard of the same radionuclide when determined under identical counting conditions and geometry.

B: Its beta-ray spectrum is identical to that of a specimen of ^{32}P of known purity showing no distinct photopeaks and no energies greater than 1.710 MeV.

Bacterial Endotoxins Test (85)—It contains not more than 175/V USP Endotoxin Unit per mL of the Injection, when compared with the USP Endotoxin RS, in which V is the maximum recommended total dose, in mL, at the expiration date or time.

pH (791): between 3.0 and 5.0.

Radiochemical purity—Place a measured volume of Suspension, to provide a count rate of about 20,000 counts per minute, about 2.5 cm from one end of a 25-mm \times 300-mm strip of chromatographic paper (see *Chromatography (621)*), and allow to dry. Develop the chromatogram by ascending chromatography, using water as the solvent, and air-dry: the radioactivity in the chromic phosphate is not less than 95.0% of the total radioactivity when measured at the origin.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products (1)*, except that the Suspension may be distributed or dispensed prior to the completion of the test for *Sterility*, the latter test being started on the day of final manufacture, and except that it is not subject to the recommendations on *Container Content*.

Assay for dextrose—

Periodic acid reagent solution—Dissolve 8.5 g of sodium metaperiodate in 80 mL of 1 N sulfuric acid, dilute with water to 100 mL, and mix.

Assay preparation—Decant the supernatant from sterile Suspension into a disposable centrifuge tube, and centrifuge. Pipet 1.0 mL of the clear supernatant into a 25-mL volumetric flask, dilute with water to volume, and mix.

Procedure—Pipet 50 mL of *Periodic acid reagent solution* into a 250-mL conical flask, add 3.0 mL of the *Assay preparation*, swirl, cover the flask, and allow to stand at room temperature for 2 hours. Add, in the order named and with rapid stirring, 50 mL of a saturated solution of sodium bicar-

bonate, 50.0 mL of 0.1 N potassium arsenite VS, 4 mL of potassium iodide solution (1 in 5), and 20 g of sodium bicarbonate. Stir the solution at room temperature for 15 minutes. Titrate with 0.1 N iodine VS, using 3 mL of starch TS as the indicator. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N iodine is equivalent to 1.802 mg of dextrose ($C_6H_{12}O_6$). Not less than 27.0% and not more than 33.0% is found.

Change to read:

Assay for radioactivity—Using a suitable counting assembly (CN 1-May-2017), determine the radioactivity, in MBq (mCi) per mL, of Sterile Suspension by use of a calibrated system as directed under *Radioactivity* (821).

Sodium Phosphate P 32 Solution

Phosphoric- ^{32}P acid, disodium salt.
Dibasic sodium phosphate- ^{32}P [7635-46-3].

» Sodium Phosphate P 32 Solution is a solution suitable for either oral or intravenous administration, containing radioactive phosphorus (^{32}P) processed in the form of Dibasic Sodium Phosphate from the neutron bombardment of elemental sulfur. Nonradioactive Dibasic Sodium Phosphate may be added during the processing.

Sodium Phosphate P 32 Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ^{32}P as phosphate expressed in megabecquerels (microcuries or millicuries) per mL at the time indicated in the labeling. Other chemical forms of radioactivity are absent.

Packaging and storage—Preserve in single-dose or multiple-dose containers that previously have been treated to prevent adsorption.

Labeling—Label it to include the following: the time and date of calibration; the amount of ^{32}P as phosphate expressed in total megabecquerels (microcuries or millicuries) and in megabecquerels (microcuries or in millicuries) per mL at the time of calibration; the name and quantity of any added preservative or stabilizer; a statement of the intended use, whether oral or intravenous; a statement of whether the contents are intended for diagnostic or therapeutic use; the expiration date; and the statements "Caution—Radioactive Material," and "Not for intracavitary use." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of ^{32}P is 14.3 days.

USP Reference standards (11)—
USP Endotoxin RS

Radionuclide identification—

A: The beta radiation of the Solution, measured according to the procedure set forth under *Radioactivity* (821), shows a mass absorption coefficient within $\pm 5\%$ of the value found for a specimen of a known standard of the same radionuclide when determined under identical counting conditions and geometry.

B: Its beta-ray and/or bremsstrahlung spectrum is identical to that of a specimen of ^{32}P of known purity showing no distinct photopeaks and no energies greater than 1.710 MeV.

Bacterial Endotoxins Test (85)—It contains not more than 175/V USP Endotoxin Unit per mL of the Injection, when compared with the USP Endotoxin RS, in which V is the maximum recommended total dose, in mL, at the expiration date or time.

pH (791): between 5.0 and 6.0.

Radiochemical purity—Place a measured volume, appropriately diluted with phosphoric acid solution (1 in 20) such that it provides a count rate of about 20,000 counts per minute, about 45 mm from the end of a 25- \times 300-mm strip of chromatographic paper (see *Chromatography* (621)), and allow to dry. Develop the chromatogram by descending chromatography, using a mixture of tertiary butyl alcohol, water, and formic acid (40:20:5). Allow to dry, and determine the position of the phosphoric acid by spraying the paper with a solution prepared by dissolving 5 g of ammonium molybdate in 100 mL of water and pouring, with constant stirring, into a mixture of 12 mL of nitric acid and 24 mL of water. Determine the position of the radioactivity distribution by scanning with a collimated radiation detector. The radioactivity appears in one band only, corresponding in R_f value to the phosphoric acid.

Other requirements—Solution intended for intravenous use meets the requirements under *Injections and Implanted Drug Products* (1), except that the Solution may be distributed or dispensed prior to completion of the test for *Sterility*, the latter test being started on the day of final manufacture, and except that it is not subject to the recommendation on *Container Content*.

Change to read:

Assay for radioactivity—Using a suitable counting assembly (CN 1-May-2017), determine the radioactivity, in MBq (mCi) per mL, of Solution by use of a calibrated system as directed under *Radioactivity* (821)).

Physostigmine Salicylate

$C_{15}H_{21}N_3O_2 \cdot C_7H_6O_3$ 413.47
Pyrrolo[2,3-b]indol-5-ol, 1,2,3,3a,8,8a-hexahydro-1,3a,8-trimethyl-, methylcarbamate (ester), (3a*S*-*cis*-), mono(2-hydroxybenzoate);
Physostigmine monosalicylate [57-64-7].

DEFINITION

Physostigmine Salicylate contains NLT 97.0% and NMT 102.0% of physostigmine salicylate ($C_{15}H_{21}N_3O_2 \cdot C_7H_6O_3$), calculated on the dried basis.

IDENTIFICATION

- **A. IDENTIFICATION—ORGANIC NITROGENOUS BASES** (181)
Analysis: Use 1 g of sodium bicarbonate instead of 2 mL of 1 N sodium hydroxide.
Acceptance criteria: Meets the requirements
- **B. IDENTIFICATION TESTS—GENERAL, Salicylate** (191): Meets the requirements

ASSAY

• PROCEDURE

Sample: 250 mg of Physostigmine Salicylate

Analysis: Dissolve the *Sample* in 25 mL of chloroform, and add 25 mL of glacial acetic acid. Titrate with 0.02 N perchloric acid in dioxane VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.02 N perchloric acid is equivalent to 8.270 mg of physostigmine salicylate ($C_{15}H_{21}N_3O_2 \cdot C_7H_6O_3$).

Acceptance criteria: 97.0%–102.0% on the dried basis

IMPURITIES

• RESIDUE ON IGNITION (281)

Sample: 100 mg

Acceptance criteria: Negligible

• SULFATE

Sample solution: Precipitate the salicylic acid from 10 mL of a cold, saturated solution of Physostigmine Salicylate with a slight excess of 3 N hydrochloric acid, and filter.

Analysis: Add 5 drops of barium chloride TS to the Sample solution.

Acceptance criteria: No turbidity is produced immediately.

SPECIFIC TESTS

• OPTICAL ROTATION, Specific Rotation (781S)

Sample solution: 10 mg/mL in water

Acceptance criteria: -91° to -94°

• LOSS ON DRYING (731)

Analysis: Dry over silica gel for 24 h.

Acceptance criteria: NMT 1.0%

• READILY CARBONIZABLE SUBSTANCES TEST (271)

Sample solution: Dissolve 100 mg in 5 mL of sulfuric acid.

Acceptance criteria: At the end of 5 min, the Sample solution has no more color than Matching Fluid I.

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE: Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

• USP REFERENCE STANDARDS (11)

USP Physostigmine Salicylate RS

Physostigmine Salicylate Injection

DEFINITION

Physostigmine Salicylate Injection is a sterile solution of Physostigmine Salicylate in Water for Injection. It contains NLT 90.0% and NMT 110.0% of the labeled amount of physostigmine salicylate ($C_{15}H_{21}N_3O_2 \cdot C_7H_6O_3$). It may contain an antimicrobial agent and an antioxidant.

[NOTE—Do not use the Injection if it is more than slightly discolored.]

IDENTIFICATION

• A. IDENTIFICATION—ORGANIC NITROGENOUS BASES (181)

Analysis: Use 1 g of sodium bicarbonate instead of 2 mL of 1 N sodium hydroxide.

Acceptance criteria: Meets the requirements

• B. IDENTIFICATION TESTS—GENERAL, Salicylate (191): Meets the requirements

ASSAY

• PROCEDURE

Buffer: 3.85 g/L of ammonium acetate in water. Adjust, if necessary, with glacial acetic acid or ammonium hydroxide to a pH of 6 ± 0.1 .

Mobile phase: Acetonitrile and Buffer (50:50)

Solution A: 100 μ L of USP Benzyl Alcohol RS and 1 μ L of benzaldehyde in 400 mL of acetonitrile

Standard solution: 0.03 mg/mL of USP Physostigmine Salicylate RS in Solution A

Sample solution: Nominally 0.03 mg/mL from a suitable volume of Injection containing NLT 3 mg of physostigmine salicylate diluted with acetonitrile

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm \times 30-cm; packing L1

Flow rate: 2 mL/min

Injection volume: 10 μ L

System suitability

Samples: Solution A and Standard solution

[NOTE—If the peaks due to benzyl alcohol and benzaldehyde co-elute when Solution A is injected, the Standard solution will exhibit only two peaks instead of three. In a suitable system, benzyl alcohol and benzaldehyde elute before physostigmine.]

Suitability requirements

Resolution: NLT 2.0 between the physostigmine peak and the adjacent peak (benzyl alcohol or benzaldehyde, or the combination of these), Standard solution

Column efficiency: NLT 1200 theoretical plates from the analyte peak, Standard solution

Relative standard deviation: NMT 2.0%, Standard solution

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of physostigmine salicylate ($C_{15}H_{21}N_3O_2 \cdot C_7H_6O_3$) in the portion of Injection taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response from the Sample solution

r_s = peak response from the Standard solution

C_s = concentration of USP Physostigmine Salicylate RS in the Standard solution (mg/mL)

C_u = nominal concentration of physostigmine salicylate in the Sample solution (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

• BACTERIAL ENDOTOXINS TEST (85): NMT 83.4 USP Endotoxin Units/mg of physostigmine salicylate

• PH (791): 3.5–5.0

• OTHER REQUIREMENTS: It meets the requirements in Injections and Implanted Drug Products (1).

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE: Preserve in single-dose containers, preferably of Type I glass, protected from light.

• USP REFERENCE STANDARDS (11)

USP Benzyl Alcohol RS

USP Endotoxin RS

USP Physostigmine Salicylate RS

Physostigmine Salicylate Ophthalmic Solution

DEFINITION

Physostigmine Salicylate Ophthalmic Solution is a sterile, aqueous solution of physostigmine salicylate. It contains NLT 90.0% and NMT 110.0% of the labeled amount of physostigmine salicylate ($C_{15}H_{21}N_3O_2 \cdot C_7H_6O_3$). It may contain suitable antimicrobial agents, buffers, and stabilizers and suitable additives to increase its viscosity.

IDENTIFICATION

• A. IDENTIFICATION—ORGANIC NITROGENOUS BASES (181)

Analysis: Use 1 g of sodium bicarbonate instead of 2 mL of 1 N sodium hydroxide.

Acceptance criteria: Meets the requirements

• B. IDENTIFICATION TESTS—GENERAL, Salicylate (191): Meets the requirements

ASSAY• **PROCEDURE**

Buffer: 3.85 g/L of ammonium acetate in water adjusted, if necessary, with glacial acetic acid or ammonium hydroxide to a pH of 6 ± 0.1

Mobile phase: Acetonitrile and Buffer (50:50)

Standard solution: 0.03 mg/mL of USP Physostigmine Salicylate RS in acetonitrile

Sample solution: Nominally 0.03 mg/mL of physostigmine salicylate from a volume of Ophthalmic Solution containing NLT 3 mg of physostigmine salicylate diluted with acetonitrile

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm \times 30-cm; packing L1

Flow rate: 2 mL/min

Injection volume: 10 μ L

System suitability

Sample: Standard solution

Suitability requirements

Column efficiency: NLT 1200 theoretical plates

Relative standard deviation: NMT 2.0%

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of physostigmine salicylate ($C_{15}H_{21}N_3O_2 \cdot C_7H_6O_3$) in the portion of Ophthalmic Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the Sample solution

r_S = peak response from the Standard solution

C_S = concentration of USP Physostigmine Salicylate RS in the Standard solution (mg/mL)

C_U = nominal concentration of physostigmine salicylate in the Sample solution (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

• **STERILITY TESTS (71):** Meets the requirements

• **PH (791):** 2.0–4.0

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• **USP REFERENCE STANDARDS (11)**

USP Physostigmine Salicylate RS

Phytonadione

$C_{31}H_{46}O_2$ 450.70

1,4-Naphthalenedione, 2-methyl-3-(3,7,11,15-tetramethyl-2-hexadecenyl)-, [*R*-(*R**,*R**(*E*))]—; Phylloquinone [84-80-0].

DEFINITION

Phytonadione is a mixture of *E*- and *Z*-isomers containing NLT 97.0% and NMT 103.0% of phytonadione isomers ($C_{31}H_{46}O_2$). It contains NMT 21.0% of the *Z*-isomer.

IDENTIFICATION

• **A. INFRARED ABSORPTION (197F)**

• **B. ULTRAVIOLET ABSORPTION (197U)**

Analytical wavelength: 248 nm

Sample solution: 10 μ g/mL in *n*-hexane

Acceptance criteria: Meets the requirements. Absorptivities do not differ by more than 3.0%.

ASSAY• **PROCEDURE**

[NOTE—Protect solutions containing phytonadione from exposure to light.]

Mobile phase: *n*-Hexane and *n*-amyl alcohol (2000:1.5)

Internal standard solution: 2.5 mg/mL of cholesteryl benzoate in Mobile phase

Standard solution: Prepare a 96- μ g/mL solution of USP Phytonadione RS in Mobile phase. Pipet 10 mL of this solution and 7 mL of Internal standard solution into a 25-mL volumetric flask, and dilute with Mobile phase to volume.

Sample solution: Prepare as directed for the Standard solution, using Phytonadione instead of USP Phytonadione RS.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 25-cm; packing L3

Flow rate: 1 mL/min

Injection size: 50 μ L

System suitability

Sample: Standard solution

[NOTE—The relative retention times for the internal standard, (*Z*)-phytonadione, and (*E*)-phytonadione are 0.7, 0.9, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.5 between (*Z*)-phytonadione and (*E*)-phytonadione

Relative standard deviation: NMT 2.0% for the ratios of the sum of peak areas of (*Z*)-phytonadione and (*E*)-phytonadione to the peak area of the internal standard

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of phytonadione ($C_{31}H_{46}O_2$) in the portion of Phytonadione taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = internal standard ratio (sum of peak areas of (*Z*)-phytonadione and (*E*)-phytonadione/peak area of the internal standard) from the Sample solution

R_S = internal standard ratio (sum of peak areas of (*Z*)-phytonadione and (*E*)-phytonadione/peak area of the internal standard) from the Standard solution

C_S = concentration of USP Phytonadione RS in the Standard solution (μ g/mL)

C_U = concentration of Phytonadione in the Sample solution (μ g/mL)

Acceptance criteria: 97.0%–103.0%

OTHER COMPONENTS• **Z-ISOMER CONTENT**

[NOTE—Protect solutions containing phytonadione from exposure to light.]

Mobile phase, Internal standard solution, Sample solution, Chromatographic system, and Analysis: Proceed as directed in the Assay, except calculate the percentage of *Z*-isomer in the portion of Phytonadione taken:

$$\text{Result} = [r_Z/(r_Z + r_E)] \times 100$$

r_z = peak area of the (Z)-phytonadione isomer from the *Sample solution*

r_E = peak area of the (E)-phytonadione isomer from the *Sample solution*

Acceptance criteria: NMT 21.0%

IMPURITIES

• LIMIT OF MENADIONE

Sample: 20 mg of Phytonadione

Analysis: Mix the *Sample* with 0.5 mL of a mixture of 6 N ammonium hydroxide and alcohol (1:1). Add 1 drop of ethyl cyanoacetate, and shake gently.

Acceptance criteria: No purple or blue color is produced.

SPECIFIC TESTS

• **REFRACTIVE INDEX (831):** 1.523–1.526

• **REACTION:** A 50-mg/mL solution of Phytonadione in dehydrated alcohol is neutral to litmus.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• **USP REFERENCE STANDARDS (11)**
USP Phytonadione RS

Phytonadione Injectable Emulsion

» Phytonadione Injectable Emulsion is a sterile, aqueous dispersion of Phytonadione. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{31}H_{46}O_2$. It contains suitable solubilizing and/or dispersing agents.

Packaging and storage—Preserve in single-dose or multiple-dose containers, preferably of Type I glass, protected from light.

USP Reference standards (11)—

USP Endotoxin RS

USP Phytonadione RS

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Bacterial Endotoxins Test (85)—It contains not more than 14.0 USP Endotoxin Units per mg of phytonadione.

pH (791): between 3.5 and 7.0.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products (1)*.

Assay—[NOTE—Use low-actinic glassware throughout this assay, and otherwise protect the solutions from exposure to light.]

Mobile phase—Prepare a suitable degassed mixture of dehydrated alcohol and water (95:5).

Standard preparation—Dissolve an accurately weighed quantity of USP Phytonadione RS in *Mobile phase* to obtain a solution having a known concentration of about 1 mg per mL. Pipet 1 mL of this solution into a 10-mL volumetric flask, dilute with *Mobile phase* to volume, and mix to obtain a *Standard preparation* having a known concentration of about 0.1 mg per mL.

Assay preparation 1 (containing 10 mg or more of phytonadione per mL)—Pipet a volume of Injectable Emulsion, equivalent to 10 mg of phytonadione, into a 10-mL volumetric flask, dilute with *Mobile phase* to volume, and

mix. Pipet 1 mL of this solution into a 10-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Assay preparation 2 (containing less than 10 mg of phytonadione per mL)—Pipet a volume of Injectable Emulsion, equivalent to 1 mg of phytonadione, into a 10-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see Chromatography (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 25-cm column that contains packing L1. The flow rate is about 0.7 mL per minute. Chromatograph five replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 1.5%.

Procedure—Separately inject equal volumes (about 10 μ L) of the *Standard preparation* and the appropriate *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak response for the major peak. Calculate the quantity, in mg, of $C_{31}H_{46}O_2$ in each mL of the Injectable Emulsion taken by the formula:

$$D(C/V)(r_U / r_S)$$

in which *D* is 100 if the Injectable Emulsion contains 10 mg or more of phytonadione per mL, or 10 if the Injectable Emulsion contains less than 10 mg of phytonadione per mL; *C* is the concentration, in mg per mL, of USP Phytonadione RS in the *Standard preparation*; *V* is the volume, in mL, of Injectable Emulsion taken; and r_U and r_S are the peak responses of phytonadione obtained from the appropriate *Assay preparation* and the *Standard preparation*, respectively.

Phytonadione Tablets

DEFINITION

Phytonadione Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of phytonadione ($C_{31}H_{46}O_2$).

IDENTIFICATION

• A. ULTRAVIOLET ABSORPTION

Standard solution: 0.01 mg/mL of USP Phytonadione RS in dehydrated alcohol

Sample solution: A portion of finely powdered Tablets, equivalent to 0.01 mg/mL of phytonadione in dehydrated alcohol. Shake vigorously, and filter. Use the filtrate.

Acceptance criteria: The UV absorption spectrum of the *Sample solution* exhibits maxima and minima at the same wavelengths as that of the *Standard solution* concomitantly measured.

• B. HPLC IDENTIFICATION TEST

Analysis: Proceed as directed in the *Assay*.

Acceptance criteria: The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*.

ASSAY

• PROCEDURE

[NOTE—Use low-actinic glassware throughout the *Assay*, and otherwise protect the solutions from light.]

Mobile phase: Dehydrated alcohol and water (95:5)

Standard solution: 0.10 mg/mL of USP Phytonadione RS in dehydrated alcohol

Sample solution: 0.1 mg/mL of phytonadione in dehydrated alcohol prepared as follows. Mix a portion of finely powdered Tablets (NLT 20) with dehydrated alcohol to obtain a nominal concentration of 0.4 mg/mL of phytonadione. Shake by mechanical means for 15 min, dilute with dehydrated alcohol to 0.10 mg/mL, and filter.

Chromatographic system(See *Chromatography* (621), *System Suitability*.)**Mode:** LC**Detector:** UV 254 nm**Column:** 4-mm × 30-cm; packing L1**Flow rate:** 1.5 mL/min**Injection size:** 10 µL**System suitability****Sample:** *Standard solution* (three replicate injections)**Suitability requirements****Column efficiency:** NLT 915 theoretical plates, determined from the analyte peak**Tailing factor:** NMT 2.0**Relative standard deviation:** NMT 2.0%

[NOTE—Z- and E-isomers coelute in this chromatographic system.]

Analysis**Samples:** *Standard solution* and *Sample solution*Calculate the percentage of the labeled amount of phytonadione (C₃₁H₄₆O₂) in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

 r_u = peak area from the *Sample solution* r_s = peak area from the *Standard solution* C_s = concentration of USP Phytonadione RS in the *Standard solution* (mg/mL) C_u = nominal concentration of phytonadione in the *Sample solution* (mg/mL)**Acceptance criteria:** 90.0%–110.0%**PERFORMANCE TESTS**• **DISINTEGRATION** (701)**Time:** 30 min• **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements**ADDITIONAL REQUIREMENTS**• **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.• **USP REFERENCE STANDARDS** (11)
USP Phytonadione RS**Pilocarpine**C₁₁H₁₆N₂O₂ 208.26

2(3H)-Furanone, 3-ethylidihydro-4-[(1-methyl-1H-imidazol-5-yl)methyl]-, (3S-cis)-.

Pilocarpine [92-13-7].

» Pilocarpine contains not less than 95.0 percent and not more than 100.5 percent of pilocarpine (C₁₁H₁₆N₂O₂), calculated on the anhydrous basis.

Packaging and storage—Preserve in tight, light-resistant containers, in a cold place.

USP Reference standards (11)—

USP Pilocarpine RS

USP Pilocarpine Nitrate RS

Identification—**A:** *Infrared Absorption* (197F).**B:** *Ultraviolet Absorption* (197U)—**Solution:** 20 µg per mL.**Medium:** water.**Specific rotation** (781S): between +102° and +107°.**Test solution:** 20 mg per mL, in pH 6.0 phosphate buffer.**Refractive index** (831): between 1.5170 and 1.5210 at 25°, determined in a liquid specimen. If crystals are present, first warm to about 40°.**Water Determination, Method I** (921): not more than 0.5%.**Chloride—**

Standard chloride solution—Transfer 165 mg of sodium chloride to a 100-mL volumetric flask, and dissolve in and dilute with water to volume. Transfer 25.0 mL of this solution to a 1000-mL volumetric flask, and dilute with water to volume. This solution contains 25 µg of chloride per mL.

Test solution—Transfer about 1.0 g of Pilocarpine, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with water to volume.

Procedure—Transfer 5.0 mL of the *Test solution* to a test tube, add 0.6 mL of diluted nitric acid and 0.3 mL of silver nitrate TS: any opalescence produced is not greater than that produced by an identically treated solution containing 5.0 mL of the *Standard chloride solution* (0.25%).

Sulfate—

Standard sulfate solution—Dissolve 148 mg of anhydrous sodium sulfate in water, and dilute with water to 100 mL. Dilute 10.0 mL of this solution with water to 1000 mL. This solution contains 10 µg of sulfate per mL.

Procedure—To about 1 g of Pilocarpine in a test tube add 1 mL of 6 N hydrochloric acid and 4 mL of water, and mix. For the control, transfer 4.0 mL of *Standard sulfate solution* to a test tube, add 1 mL of 6 N hydrochloric acid, and mix. Adjust both solutions with pH indicator paper by the dropwise addition of 3 N hydrochloric acid or 6 N ammonium hydroxide, if necessary, to a pH of between 2 and 3. Add water to maintain the same volume in the control and test specimen tubes. To each tube add 1 mL of barium chloride TS, and mix: any turbidity produced in the specimen tube after 10 minutes' standing is not greater than that produced in the control (0.004%).

Limit of nitrate—

Standard preparation—Prepare a solution of USP Pilocarpine Nitrate RS to contain 43 µg per mL. This solution contains the equivalent of 10 µg of nitrate ion per mL.

Test preparation—Prepare a solution of Pilocarpine to contain 200 µg per mL.

Procedure—Transfer 0.5-mL portions of the *Test preparation* and of the *Standard preparation*, respectively, to separate test tubes, and to each tube add 1 drop of a 1 in 100 solution of sulfanilic acid in 5 N acetic acid and 1 drop of a 3 in 1000 solution of N-(1-naphthyl)ethylenediamine dihydrochloride in 5 N acetic acid. Adjust the *Standard preparation* and the *Test preparation* with pH indicator paper by the dropwise addition of 3 N hydrochloric acid or 1 N ammonium hydroxide, if necessary, to a pH of between 2 and 3. To each solution add a few granules of acid-washed, nitrate-free zinc. Heat the test tubes in a water bath at a temperature of about 32°. Allow 5 minutes for the development of a pink color: any pink color observed in the *Test preparation* is not greater than that observed in the *Standard preparation* (0.005%).

Related compounds—

Buffer solution, Mobile phase, System suitability preparation, and Chromatographic system—Proceed as directed in the Assay.

Standard solution—Prepare a solution in water of isopilocarpine nitrate to contain 1.5 µg per mL.

Test preparation—Prepare as directed for Assay preparation in the Assay.

Procedure—Separately inject equal volumes (about 40 µL) of the *Standard solution* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the responses for all the peaks. Calculate the percentage of isopilocarpine in the portion of Pilocarpine taken by the formula:

$$(208.26 / 271.27)50(C / W)(r_U / r_S)$$

in which 208.26 and 271.27 are the molecular weights of pilocarpine and isopilocarpine nitrate, respectively, *C* is the concentration, in µg per mL, of isopilocarpine nitrate in the *Standard solution*, *W* is the weight, in mg, of Pilocarpine taken, and *r_U* and *r_S* are the peak responses due to isopilocarpine in the *Test preparation* and the *Standard solution*, respectively; not more than 2% of isopilocarpine is found. Calculate the percentage of all other impurities from the chromatogram of the *Test preparation* taken by the formula:

$$(208.26 / 271.27)50(C / W)(r_i / r_S)$$

in which *r_i* is the peak response due to the impurity; no one impurity corresponding to one of the four peaks in the *System suitability preparation* exceeds 3%; no other individual impurity exceeds 0.5%. The sum total of all impurities, including isopilocarpine, is not more than 5.0%.

Assay—

Buffer solution—Transfer 13.5 mL of phosphoric acid to a 1-liter beaker containing 700 mL of water. Add 3 mL of triethylamine, and dilute with water to 1000 mL. Adjust with 20% sodium hydroxide to a pH of 3.0.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and methanol (98:2). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)). [NOTE—Do not store this *Mobile phase* for more than 2 days.]

Standard preparation—Prepare a solution in water having an accurately known concentration of about 40 µg of USP Pilocarpine Nitrate RS per mL. [NOTE—Use this solution within 24 hours of its preparation.]

Assay preparation—Transfer an accurately weighed quantity of about 15 mg of Pilocarpine to a 500-mL volumetric flask. Dilute with water to volume, and mix. [NOTE—Use this solution within 24 hours of its preparation.]

System suitability preparation—Transfer accurately weighed quantities of about 30 mg each of pilocarpine hydrochloride and isopilocarpine nitrate to a 50-mL volumetric flask, and dilute with water to volume. Transfer 25 mL of this solution to a suitable flask, add 5 mL of 1 N sodium hydroxide, and reflux for 1 hour. Cool, and adjust the solution with 0.25 M phosphoric acid to a pH of 7.0. Quantitatively transfer this solution to a 50-mL volumetric flask, dilute with water to volume, and mix. Dilute the remaining original solution with water to volume, and mix. Add 1 mL each of the refluxed and unrefluxed solutions to a 10-mL volumetric flask, dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm × 12.5-cm column that contains 3-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure*; the relative standard deviation is not more than 2.0%. Chromatograph the *System suitability preparation*, and record the peak responses as directed for *Procedure*; four peaks are observed; the resolution, *R*, between two adjacent peaks is not less than 1.2, the column efficiency determined for the pilo-

carpine peak is not less than 1500 theoretical plates, and the tailing factor, *T*, for the pilocarpine peak is not greater than 1.5. The relative retention times for the major peaks are about 0.67 for isopilocarpine, 0.76 for pilocarpine, 0.85 for pilocarpic acid, and 1.0 for isopilocarpic acid.

Procedure—Separately inject equal volumes (about 40 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for all the peaks. Calculate the quantity, in mg, of pilocarpine (C₁₁H₁₆N₂O₂) in the portion of Pilocarpine taken by the formula:

$$(208.26 / 271.27)500C(r_U / r_S)$$

in which 208.26 and 271.27 are the molecular weights of pilocarpine and pilocarpine nitrate, respectively, *C* is the concentration, in mg per mL, of USP Pilocarpine Nitrate RS in the *Standard preparation*, and *r_U* and *r_S* are the peak responses for pilocarpine obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Pilocarpine Ocular System

» Pilocarpine Ocular System contains not less than 85.0 percent and not more than 115.0 percent of the labeled amount of pilocarpine (C₁₁H₁₆N₂O₂). It is sterile.

Packaging and storage—Preserve in single-dose containers in a cold place.

USP Reference standards (11)—

USP Pilocarpine RS

USP Pilocarpine Hydrochloride RS

USP Pilocarpine Nitrate RS

Identification—Cut around the inside margin of the Ocular System, then discard the ring encircling the Ocular System, extract the remaining portion with 0.5 mL of methanol in a small capped vial, shaking vigorously for 1 to 2 minutes. Evaporate the methanol extract on a sodium chloride plate forming a thin film: the IR absorption spectrum of the film exhibits maxima only at the same wavelengths as that of a similar preparation of USP Pilocarpine RS.

Sterility Tests (71): meets the requirements.

Uniformity of dosage units (905): meets the requirements for capsules.

Drug release pattern—Place each of the Ocular Systems in suitable porous holders made of an inert material, and suspend each from a nickel wire. To the upper end of the wire attach a tag identifying the specimen. Put each assembly into a test tube containing 27.0 mL of saline TS so that the system lies at the bottom of the tube and the identifying tag extends from the open top of the tube. Put the tubes into a horizontally reciprocating shaker in which the temperature is maintained at 37 ± 0.5°. Agitate the tubes with a horizontal amplitude of about 4 cm and a frequency of about 35 cycles per minute. At 7, 24, 48, 72, 96, and 168 hours, remove the assemblies from their tubes, and each time replace them in similar tubes containing 27.0 mL of fresh saline TS. Determine the amount of pilocarpine in solution in each tube, after adjusting the volume to 27.0 mL to make up for any evaporative losses, by measuring the UV absorbance in 1-cm cells at the wavelength of maximum absorbance at about 215 nm, with a suitable spectrophotometer, against saline TS as the blank. Concomitantly measure the absorbance of a Standard solution of USP Pilocarpine Hydrochloride RS having a known concentration of

about 20 µg in each mL of saline TS. Calculate the quantity, in µg, of $C_{11}H_{16}N_2O_2$ in each solution taken by the formula:

$$(208.26 / 244.72)(A_U / A_S)27C$$

in which 208.26 and 244.72 are the molecular weights of pilocarpine and pilocarpine hydrochloride, respectively; A_U and A_S are the absorbances of the test solution and the Standard solution, respectively; and C is the concentration, in µg per mL, of USP Pilocarpine Hydrochloride RS in the Standard solution. Calculate the amount of pilocarpine released in 168 hours by adding the pilocarpine content of each set of tubes collected over 168 hours.

Tolerances—The amount of $C_{11}H_{16}N_2O_2$ from each Ocular System released during the total 0 to 168 hours tested conforms to *Acceptance Table 1* under *Drug Release* (724). The drug release range for this time period is not less than 80.0% and not more than 120.0% of the labeled release pattern.

Assay—

Buffer solution, Mobile phase, Standard preparation, System suitability preparation, and Chromatographic system—Proceed as directed in the Assay under *Pilocarpine*.

Assay preparation—Select not fewer than 10 Ocular Systems. Cut each System into 4 pieces, transfer quantitatively to a 500-mL volumetric flask, and rinse all cutting utensils with 20 to 30 mL of methanol into the flask. Make additional rinses of the utensils with about 250 mL of *Mobile phase*, and collect all the rinses in the flasks. Allow the flasks to stand for 30 minutes, sonicate for about 15 minutes, dilute with water to volume, and mix. Transfer an aliquot of the supernatant, equivalent to 6 mg of pilocarpine to a 200-mL volumetric flask, dilute with water to volume, mix, and filter.

Procedure—Proceed as directed for *Procedure* in the Assay under *Pilocarpine*. Calculate the quantity, in mg, of pilocarpine in each Ocular System taken by the formula:

$$(208.26 / 271.27)(10 / V)(C / N)(r_U / r_S)$$

in which 208.26 and 271.27 are the molecular weights of pilocarpine and pilocarpine nitrate, respectively; V is the volume, in mL, of the supernatant taken (see *Assay preparation*); C is the concentration, in µg per mL, of USP Pilocarpine Nitrate RS in the *Standard preparation*; N is the number of Ocular Systems taken; and r_U and r_S are the peak responses for pilocarpine obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Pilocarpine Hydrochloride

$C_{11}H_{16}N_2O_2 \cdot HCl$ 244.72
2(3*H*)-Furanone, 3-ethylidihydro-4-[(1-methyl-1*H*-imidazol-5-yl)methyl]-, monohydrochloride, (3*S*-*cis*)-;
Pilocarpine monohydrochloride [54-71-7].

DEFINITION

Pilocarpine Hydrochloride contains NLT 98.0% and NMT 102.0% of $C_{11}H_{16}N_2O_2 \cdot HCl$, calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197M)
- **B. IDENTIFICATION TESTS—GENERAL, Chloride** (191): Meets the requirements
Sample solution: 50 mg/mL

ASSAY

• PROCEDURE

Buffer: 4.4 g/L of dibasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 6.5 ± 0.1.

Mobile phase: Acetonitrile, methanol, and *Buffer* (2:35:63)

Standard solution: 0.5 mg/mL of USP Pilocarpine Hydrochloride RS in water. [NOTE—Sonicate if necessary.]

System suitability solution: Transfer a known quantity of USP Pilocarpine Hydrochloride RS in a suitable volumetric flask, and add water, equivalent to 10% of the volume of the flask, to dissolve. [NOTE—Sonicate as needed.] Add 0.1 N sodium hydroxide, equivalent to 10% of the volume of the flask, quench immediately with the same volume of 0.1 N hydrochloric acid, and mix. Dilute with water to volume. [NOTE—The initial concentration of USP Pilocarpine Hydrochloride RS is 0.5 mg/mL. Isopilocarpine is formed in the *System suitability solution* preparation.]

Sample solution: 0.5 mg/mL of Pilocarpine Hydrochloride in water. [NOTE—Sonicate if necessary.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm × 15-cm; 3-µm packing L11

Column temperature: 35°

Flow rate: 1.0 mL/min

Injection size: 10 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 1.5 between isopilocarpine and pilocarpine, *System suitability solution*

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $C_{11}H_{16}N_2O_2 \cdot HCl$ in the portion of Pilocarpine Hydrochloride taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Pilocarpine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = concentration of Pilocarpine Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

Organic Impurities

• PROCEDURE 1: RELATED COMPOUNDS

Mobile phase, Standard solution, System suitability solution, and Sample solution: Proceed as directed in the Assay.

Sensitivity solution: 0.25 µg/mL of USP Pilocarpine Hydrochloride RS in water from the *Standard solution*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm × 15-cm; 3-µm packing L11

Column temperature: 35°

Flow rate: 1.0 mL/min

Run time: NLT 5 times the retention time of the pilocarpine peak

Injection size: 10 µL

System suitability

Samples: *Standard solution*, *System suitability solution*, and *Sensitivity solution*

Suitability requirements

Resolution: NLT 1.5 between isopilocarpine and pilocarpine, *System suitability solution*

Signal-to-noise ratio: NLT 10 for the pilocarpine peak, *Sensitivity solution*

Relative standard deviation: NMT 2.0% for the pilocarpine peak, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Pilocarpine Hydrochloride taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak area of each individual impurity from the *Sample solution*

r_s = peak area of pilocarpine from the *Standard solution*

C_s = concentration of USP Pilocarpine Hydrochloride RS in the *Standard solution* (mg/mL)

C_u = concentration of Pilocarpine Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria

Individual impurities: See *Impurity Table 1*. [NOTE—Disregard any unspecified impurity peaks less than 0.05%.]

Total impurities: NMT 1.0%

Impurity Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Isopilocarpine ^a	0.94	1.0
Pilocarpine	1.00	—
Pilocarpic acid ^b	1.15	0.5
Isopilocarpic acid ^c	1.19	0.1
Any unspecified impurity	—	0.1

^a (3*R*,4*R*)-3-Ethyl-4-[(1-methyl-1*H*-imidazol-5-yl)methyl]dihydrofuran-2(3*H*)-one.

^b (2*S*,3*R*)-2-Ethyl-4-hydroxy-3-[(1-methyl-1*H*-imidazol-5-yl)methyl]butanoic acid.

^c (2*R*,3*R*)-2-Ethyl-4-hydroxy-3-[(1-methyl-1*H*-imidazol-5-yl)methyl]butanoic acid.

• PROCEDURE 2: OTHER ALKALOIDS

Sample solution: 10 mg/mL in water

Analysis: Divide the *Sample solution* into two portions. To one portion add a few drops of 6 N ammonium hydroxide, and to the other, add a few drops of potassium dichromate TS.

Acceptance criteria: No turbidity is produced in either solution.

SPECIFIC TESTS

- OPTICAL ROTATION, Specific Rotation (781S):** +88.5° to +91.5°

Sample solution: 20 mg/mL, in water

- LOSS ON DRYING (731):** Dry a sample at 105° for 2 h: it loses NMT 3.0% of its weight.

- READILY CARBONIZABLE SUBSTANCES TEST (271)**

Sample solution: 50 mg/mL in sulfuric acid

Acceptance criteria: The solution has no more color than *Matching Fluid B*.

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at room temperature.

• USP REFERENCE STANDARDS (11)

USP Pilocarpine Hydrochloride RS

Pilocarpine Hydrochloride Ophthalmic Solution

DEFINITION

Pilocarpine Hydrochloride Ophthalmic Solution is a sterile, buffered, aqueous solution of pilocarpine hydrochloride. It contains NLT 90.0% and NMT 110.0% of the labeled amount of pilocarpine hydrochloride ($C_{11}H_{16}N_2O_2 \cdot HCl$). It may contain suitable antimicrobial agents and stabilizers, and suitable additives to increase its viscosity.

IDENTIFICATION

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

• PROCEDURE

Solution A: Ammonium hydroxide in isopropyl alcohol (1 in 50)

Mobile phase: *n*-Hexane and *Solution A* (700:300)

Standard solution: 1.6 mg/mL of USP Pilocarpine Hydrochloride RS in water

Sample solution: Nominally equivalent to 1.6 mg/mL of pilocarpine hydrochloride from a volume of Ophthalmic Solution diluted with methanol

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 25-cm; packing L3

Flow rate: 2 mL/min

Injection size: 10 µL

System suitability

Sample: *Standard solution*

[NOTE—The retention time for pilocarpine hydrochloride is 16 min.]

Suitability requirements

Relative standard deviation: NMT 2.0% for pilocarpine hydrochloride for three replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of pilocarpine hydrochloride ($C_{11}H_{16}N_2O_2 \cdot HCl$) in each mL of Ophthalmic Solution taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response from the *Sample solution*

r_s = peak response from the *Standard solution*

C_s = concentration of USP Pilocarpine Hydrochloride RS in the *Standard solution* (mg/mL)

C_u = nominal concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- **STERILITY TESTS** (71): Meets the requirements
- **PH** (791): 3.5–5.5

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS** (11)
USP Pilocarpine Hydrochloride RS

Pilocarpine Hydrochloride Tablets

DEFINITION

Pilocarpine Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of pilocarpine hydrochloride ($C_{11}H_{16}N_2O_2 \cdot HCl$).

IDENTIFICATION

- The retention time of the major peak of the *Sample solution* corresponds to the major peak of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Solution A: 10 N sodium hydroxide, 85% phosphoric acid, triethylamine, and water (7:6:1:500). Adjust with 10 N sodium hydroxide to a pH of 3.0.

Mobile phase: Methanol and *Solution A* (3:100)

Standard solution: 50 µg/mL of USP Pilocarpine Hydrochloride RS

System suitability solution: Transfer 10 mL of the *Standard solution* to a test tube. Add 100 µL of 2 N sodium hydroxide, mix well, and allow it to stand for 5 min. Add 100 µL of 2 N hydrochloric acid and mix well.

[NOTE—This preparation contains pilocarpine, isopilocarpine, and two unidentified compounds.]

Sample stock solution: Place Tablets, equivalent to 50 mg of pilocarpine hydrochloride, in a 500-mL volumetric flask. Fill the flask to 75% full with water. Stir for at least 30 min or more if necessary, until the tablets are completely disintegrated and the powder is finely dispersed. Dilute with water to volume.

Sample solution: Transfer 5 mL of *Sample stock solution* to a 10-mL volumetric flask, and dilute with water to volume. Pass a suitable amount of solution through a PVDF, 0.45-µm pore size filter, and discard first 5 mL.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Flow rate: 1.5 mL/min

Injection size: 20 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for isopilocarpine, pilocarpine, and two unidentified peaks are 0.9, 1.0, 1.2, and 1.5, respectively.]

Suitability requirements

Resolution: NLT 1.2 between isopilocarpine and pilocarpine; NLT 1.2 between pilocarpine and the peak at a relative retention time of 1.2; NLT 1.2 between peaks at relative retention times of 1.2 and 1.5, *System suitability solution*

Column efficiency: NLT 1500 theoretical plates, *Standard solution*

Tailing factor: NMT 1.5, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $C_{11}H_{16}N_2O_2 \cdot HCl$ in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of pilocarpine hydrochloride from the *Sample solution*

r_S = peak response of pilocarpine hydrochloride from the *Standard solution*

C_S = concentration of USP Pilocarpine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of pilocarpine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

DISSOLUTION (711)

Medium: 0.1 N hydrochloric acid; 500 mL

Apparatus 2: 50 rpm

Time: 45 min

Buffer solution: 13.5 mL of phosphoric acid and 3.0 mL of triethylamine in 1000 mL of water. Adjust with phosphoric acid or 10 N sodium hydroxide to a pH of 3.

Mobile phase: Methanol and *Buffer solution* (3:17)

Standard stock solution: 0.1 mg/mL of USP Pilocarpine Hydrochloride RS in *Medium*

Standard solution: For Tablets labeled to contain 7.5 mg, transfer 15.0 mL of the *Standard stock solution* to a 100-mL volumetric flask, and dilute with *Medium* to volume. For Tablets labeled to contain 5 mg, transfer 5.0 mL of the *Standard stock solution* to a 50-mL volumetric flask, and dilute with *Medium* to volume.

Sample solution: Pass the solution under test through a suitable, 45-µm pore size polyethylene filter.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm × 15-cm; packing L1

Flow rate: 1 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 1500 theoretical plates

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of pilocarpine hydrochloride dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

L = Tablet label claim (mg)

V = volume of *Medium*, 500 mL

Tolerances: NLT 75% (Q) of the labeled amount of pilocarpine hydrochloride is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

Procedure for content uniformity

Mobile phase, Standard solution, System suitability solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Sample solution: Place 1 Tablet in a suitable volumetric flask, fill the flask about 75% full with water, and

vigorously stir for NLT 30 min to ensure complete disintegration. Dilute with water to volume to obtain a final concentration of 0.05 mg/mL of pilocarpine hydrochloride. Pass the solution through a PVDF, 0.45- μ m pore size filter.

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{11}H_{16}N_2O_2 \cdot HCl$ in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

- r_u = peak response of pilocarpine hydrochloride from the *Sample solution*
 r_s = peak response of pilocarpine hydrochloride from the *Standard solution*
 C_s = concentration of USP Pilocarpine Hydrochloride RS in the *Standard solution* (mg/mL)
 C_u = nominal concentration of pilocarpine hydrochloride in the *Sample solution* (mg/mL)

IMPURITIES

Organic Impurities

PROCEDURE

Mobile phase, System suitability solution, and System suitability: Proceed as directed in the *Assay*.

Standard solution: 0.5 μ g/mL of USP Pilocarpine Hydrochloride RS

Sample solution: Pass a suitable amount of *Sample stock solution*, prepared as directed in the *Assay*, through a PVDF, 0.45- μ m pore size filter, and use the filtrate for analysis after discarding the first 5 mL.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L1

Flow rate: 1.5 mL/min

Injection size: 100 μ L

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times (1/F) \times 100$$

- r_u = peak response of each impurity from the *Sample solution*
 r_s = peak response of pilocarpine hydrochloride from the *Standard solution*
 C_s = concentration of USP Pilocarpine Hydrochloride RS in the *Standard solution* (mg/mL)
 C_u = nominal concentration of pilocarpine hydrochloride in the *Sample solution* (mg/mL)
 F = relative response factor for each impurity (see *Impurity Table 1*)

Acceptance criteria

Individual impurities: See *Impurity Table 1*.

Total impurities: NMT 1.2%

Impurity Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Isopilocarpine	0.9	0.79	1.0
Pilocarpine	1.0	1.0	—
Pilocarpic acid	1.2	1.0	0.5
Individual unspecified degradation product	—	1.0	0.2

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- USP REFERENCE STANDARDS (11)**
USP Pilocarpine Hydrochloride RS

Pilocarpine Nitrate

$C_{11}H_{16}N_2O_2 \cdot HNO_3$ 271.27

2(3*H*)-Furanone, 3-ethylidihydro-4-[(1-methyl-1*H*-imidazol-5-yl)methyl]-, (3*S*-*cis*)-, mononitrate.

Pilocarpine mononitrate [148-72-1].

» Pilocarpine Nitrate contains not less than 98.5 percent and not more than 101.0 percent of $C_{11}H_{16}N_2O_2 \cdot NO_3$, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Pilocarpine Nitrate RS

Identification—

A: *Infrared Absorption* (197K).

B: Mix a solution (1 in 10) with an equal volume of ferrous sulfate TS, and superimpose the mixture upon 5 mL of sulfuric acid contained in a test tube: the zone of contact becomes brown.

Melting range (741): between 171° and 176°, with decomposition, but the range between beginning and end of melting does not exceed 3°.

Specific rotation (781S): between +79.5° and +82.5°.

Test solution: 20 mg per mL, in water.

Loss on drying (731)—Dry it at 105° for 2 hours: it loses not more than 2.0% of its weight.

Readily carbonizable substances (271)—Dissolve 100 mg in 5 mL of sulfuric acid: the solution has no more color than *Matching Fluid A*.

Chloride—To 5 mL of a solution (1 in 50), acidified with nitric acid, add a few drops of silver nitrate TS: no opalescence is produced immediately.

Other alkaloids—Dissolve 200 mg in 20 mL of water, and divide the solution into two portions. To one portion add a few drops of 6 N ammonium hydroxide and to the other add a few drops of potassium dichromate TS: no turbidity is produced in either solution.

Assay—Dissolve about 600 mg of Pilocarpine Nitrate, accurately weighed, in 30 mL of glacial acetic acid, warming slightly to effect solution. Cool to room temperature, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 27.13 mg of $C_{11}H_{16}N_2O_2 \cdot NO_3$.

Pilocarpine Nitrate Ophthalmic Solution

» Pilocarpine Nitrate Ophthalmic Solution is a sterile, buffered, aqueous solution of Pilocarpine Nitrate. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{11}H_{16}N_2O_2 \cdot HNO_3$. It may contain suitable antimicrobial agents and stabilizers, and suitable additives to increase its viscosity.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Pilocarpine Nitrate RS

Identification—

A: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation* obtained as directed in the *Assay*.

B: It responds to *Identification test B* under *Pilocarpine Nitrate*.

Sterility Tests (71): meets the requirements.

pH (791): between 4.0 and 5.5.

Assay—Proceed with *Ophthalmic Solution* as directed in the *Assay* under *Pilocarpine Hydrochloride Ophthalmic Solution*, except to read pilocarpine nitrate instead of pilocarpine hydrochloride throughout and to calculate the quantity, in mg, of $C_{11}H_{16}N_2O_2 \cdot HNO_3$ in each mL of the *Ophthalmic Solution* taken by the formula given therein.

Pimozide

$C_{28}H_{29}F_2N_3O$ 461.55
2H-Benzimidazol-2-one, 1-[1-[4,4-bis(4-fluorophenyl)butyl]-4-piperidinyl]-1,3-dihydro-;
1-[1-[4,4-Bis(p-fluorophenyl)butyl]-4-piperidyl]-2-benzimidazolinone [2062-78-4].

DEFINITION

Pimozide contains NLT 98.0% and NMT 102.0% of pimozide ($C_{28}H_{29}F_2N_3O$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **PROCEDURE**

Solution A: 2.5 g/L of ammonium acetate and 8.5 g/L of tetrabutylammonium hydrogen sulfate in water

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

^c 1-[1-[4-(4-Fluorophenyl)-4-phenylbutyl]piperidin-4-yl]benzimidazolin-2-one.

^d 1-[1-[4-(2-Fluorophenyl)-4-phenylbutyl]piperidin-4-yl]benzimidazolin-2-one.

^e 1-[1-[4,4-Bis(4-fluorophenyl)butyl]-1,2,3,6-tetrahydropyridin-4-yl]benzimidazolin-2-one.

^f 1-[4,4-Bis(4-fluorophenyl)butyl]-4-(2-oxobenzimidazol-1-yl)piperidine 1-oxide.

SPECIFIC TESTS

• LOSS ON DRYING (731)

Analysis: Dry at 105° to a constant weight.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• USP REFERENCE STANDARDS (11)

USP Mebendazole RS

USP Pimozide RS

Pimozide Tablets

DEFINITION

Pimozide Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of pimozide ($C_{28}H_{29}F_2N_3O$).

IDENTIFICATION

• A. INFRARED ABSORPTION (197K)

Sample: Grind an appropriate number of Tablets to prepare a 1 mg/mL solution of pimozide in dichloromethane. Shake the solution for 5 min, and pass through a suitable filter. Evaporate the filtrate to dryness under reduced pressure. Add a suitable amount of potassium bromide powder, mix well, and press a small amount into a transparent pellet.

Acceptance criteria: The IR absorption spectrum of the pellet is consistent with that of USP Pimozide RS.

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

• PROCEDURE

Protect all pimozide solutions from light.

Solution A: 2.5 g/L of ammonium acetate and 8.5 g/L of tetrabutylammonium hydrogen sulfate in water

Solution B: Acetonitrile

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	80	20
10	70	30
15	70	30
16	80	20
30	80	20

System suitability solution: 0.04 mg/mL of USP Pimozide RS and 0.02 mg/mL of USP Mebendazole RS in methanol

Standard solution: 0.4 mg/mL of USP Pimozide RS in methanol

Sample solution: Nominally 0.4 mg/mL prepared as follows. Transfer a suitable number of powdered Tablets (NLT 20) to a suitable volumetric flask. Add about 70% of the flask volume of methanol, and mechanically shake for 30 min. Dilute with methanol to volume, and mix well with the aid of sonication for 10 min. Centrifuge, and pass a portion of the supernatant through a suitable filter of 0.45-μm pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 10-cm; 3-μm packing L1

Flow rate: 2 mL/min

Injection volume: 10 μL

System suitability

Samples: *System suitability solution* and *Standard solution*. [NOTE—The relative retention times for mebendazole and pimozide are 0.88 and 1.0 respectively.]

Suitability requirements

Resolution: NLT 5.0 between the pimozide and mebendazole peaks, *System suitability solution*

Relative standard deviation: NMT 2.0% for pimozide, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of pimozide ($C_{28}H_{29}F_2N_3O$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of pimozide from the *Sample solution*

r_S = peak response of pimozide from the *Standard solution*

C_S = concentration of USP Pimozide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of pimozide in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Medium: 0.01 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 30 min

Standard stock solution: Transfer 27 mg of USP Pimozide RS to a 250-mL volumetric flask containing 1 mL of lactic acid. Heat on a steam bath to dissolve, add 80 mL of hot water, and shake. Cool, dilute with water to volume, and mix.

Standard solution: Dilute the *Standard stock solution* quantitatively with 0.01 N hydrochloric acid to obtain a solution having a known concentration approximately

the same as that of the *Sample solution* (assuming complete dissolution).

Sample solution: Transfer a suitable volume of the solution under test to a suitable container, and centrifuge until clear.

Instrumental conditions

Mode: UV

Analytical wavelength: 277 nm

Cell: 5 cm

Analysis

Samples: *Standard solution* and *Sample solution*, prepared as follows. Pipet a volume of the *Sample solution*, estimated to contain 110 µg of pimozone (assuming complete dissolution), into a suitable container. Pipet an equal volume of the *Standard solution* into a second container. To each container, add 20 mL each of 1 N sodium hydroxide and chloroform. Shake each mixture by mechanical means for 15 min, and centrifuge. Aspirate and discard the aqueous layers, and transfer the chloroform layers to separate clean beakers. Use the chloroform layer for analysis.

Calculate the percentage of the labeled amount of pimozone ($C_{28}H_{29}F_2N_3O$) dissolved from absorbances of the chloroform layers from the *Sample solution* and *Standard solution*:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times (1/L) \times 100$$

A_U = absorbance of the *Sample solution* chloroform extract

A_S = absorbance of the *Standard solution* chloroform extract

C_S = concentration of USP Pimozone RS in the *Standard solution* (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of pimozone ($C_{28}H_{29}F_2N_3O$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS, Content Uniformity (905):** Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

Protect all pimozone solutions from light.

Solution A, Solution B, Mobile phase, System suitability solution, and Chromatographic system: Proceed as directed in the Assay.

Standard solution: 0.01 mg/mL of USP Pimozone RS in methanol

Sample solution: Nominally 2 mg/mL prepared as follows. Transfer a suitable number of powdered Tablets (NLT 20) to a suitable volumetric flask. Add about 70% of the flask volume of methanol, and mechanically shake for 30 min. Dilute with methanol to volume, and mix well with the aid of sonication for 10 min. Centrifuge, and pass a portion of the supernatant through a suitable filter of 0.45-µm pore size.

System suitability

Samples: *System suitability solution* and *Standard solution*. [NOTE—The relative retention times for mebendazole and pimozone are 0.88 and 1.0 respectively.]

Suitability requirements

Resolution: NLT 5.0 between pimozone and mebendazole, *System suitability solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of pimozone from the *Standard solution*

C_S = concentration of USP Pimozone RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of pimozone in the *Sample solution* (mg/mL)

Acceptance criteria

Any individual unspecified degradation product: NMT 0.5%

Total impurities: NMT 0.75%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at controlled room temperature.
- **USP REFERENCE STANDARDS (11)**
USP Mebendazole RS
USP Pimozone RS

Pindolol

$C_{14}H_{20}N_2O_2$ 248.32
2-Propanol, 1-(1*H*-indol-4-yloxy)-3-(1-methylethylamino)-;
1-(Indol-4-yloxy)-3-(isopropylamino)-2-propanol
[13523-86-9].

DEFINITION

Pindolol contains NLT 98.5% and NMT 101.0% of pindolol ($C_{14}H_{20}N_2O_2$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

• PROCEDURE

Mobile phase: Acetonitrile and 0.05 M sodium acetate, previously adjusted with glacial acetic acid to a pH of 5.0 (350:650)

System suitability solution: 0.005 mg/mL each of USP Pindolol RS and indole in *Mobile phase*

Standard stock solution: 1 mg/mL of USP Pindolol RS in *Mobile phase* prepared as follows. To a suitable amount of USP Pindolol RS, add *Mobile phase* to fill about 90% of the total volume, and sonicate for about 5 min to dissolve.

Standard solution: 0.1 mg/mL of USP Pindolol RS from *Standard stock solution* in *Mobile phase*

Sample stock solution: 1 mg/mL of Pindolol in *Mobile phase* prepared as follows. To a suitable amount of Pindolol, add *Mobile phase* to fill about 90% of the total volume, and sonicate for about 5 min to dissolve.

Sample solution: 0.1 mg/mL of Pindolol from *Sample stock solution* in *Mobile phase*

Chromatographic system

(See Chromatography (621), *System Suitability*.)

USP Pindolol RS

Pindolol Tablets

» Pindolol Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of pindolol ($C_{14}H_{20}N_2O_2$).

Packaging and storage—Preserve in well-closed containers, protected from light.

USP Reference standards (11)—

USP Pindolol RS

Identification—

A: Examine the chromatograms obtained in the test for *Chromatographic purity*: the principal spot obtained from the *Test solution* is similar in R_f value, color, and intensity to that obtained from the *Standard stock solution*.

B: The retention time exhibited by pindolol in the chromatogram of the *Assay preparation* corresponds to that of pindolol in the chromatogram of the *Standard preparation*, as obtained in the Assay.

Dissolution, Procedure for a Pooled Sample (711)—

Medium: 0.1 N hydrochloric acid; 500 mL.

Apparatus 2: 50 rpm.

Time: 15 minutes.

Mobile phase and *Chromatographic system*—Proceed as directed in the Assay.

Standard solution—Dissolve an accurately weighed quantity of USP Pindolol RS in *Dissolution Medium* to obtain a solution having a known concentration of about 0.002/ mg per mL, / being the labeled quantity, in mg, of pindolol in each Tablet. Mix equal volumes of this solution and of *Mobile phase* to obtain the *Standard solution*.

Resolution solution—Dissolve a quantity of nortriptyline hydrochloride in *Standard solution* to obtain a solution having a concentration of about 0.005 mg of nortriptyline hydrochloride per mL.

Test solution—Filter a portion of the solution under test. Mix equal volumes of the filtrate and of *Mobile phase* to obtain the *Test solution*.

Procedure—Proceed as directed for *Procedure* under the Assay. Calculate the quantity of $C_{14}H_{20}N_2O_2$ dissolved by the formula:

$$500C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Pindolol RS in the *Standard solution*; and r_U and r_S are the pindolol peak responses obtained from the *Test solution* and the *Standard solution*, respectively.

Tolerances—Not less than 80% (Q) of the labeled amount of $C_{14}H_{20}N_2O_2$ is dissolved in 15 minutes.

Uniformity of dosage units (905): meet the requirements.

Chromatographic purity—[NOTE—Protect solutions and chromatographic plate (after application of solutions) from light.]

p-Dimethylaminobenzaldehyde spray—Dissolve 1 g of *p*-dimethylaminobenzaldehyde in a mixture of 50 mL of hydrochloric acid and 50 mL of alcohol, and mix. [NOTE—Store this solution in a tightly closed, light-resistant container, and discard after 4 weeks.]

Solvent mixture—Prepare a solution of methanol and glacial acetic acid (99:1).

Standard stock solution—Dissolve an accurately weighed quantity of USP Pindolol RS in *Solvent mixture* to obtain a solution containing 5.0 mg per mL.

Standard solution 1—Dilute an accurately measured volume of *Standard stock solution* quantitatively and stepwise with *Solvent mixture* to obtain a solution containing 0.025 mg per mL.

Standard solution 2—Dilute 6.0 mL of *Standard solution 1* with *Solvent mixture* to 10.0 mL, and mix.

Standard solution 3—Dilute 4.0 mL of *Standard solution 1* with *Solvent mixture* to 10.0 mL, and mix.

Standard solution 4—Dilute 2.0 mL of *Standard solution 1* with *Solvent mixture* to 10.0 mL, and mix.

Test solution—[NOTE—Prepare this solution immediately before use, and apply last.] Transfer a portion of powdered Tablets, equivalent to 50 mg of pindolol, to a 50-mL flask, add 10.0 mL of *Solvent mixture*, insert the stopper in the flask, and shake by mechanical means for 15 minutes. Centrifuge a portion of the resultant suspension, and promptly test the clear supernatant.

Procedure—Prepare a lined chromatographic chamber (see *Chromatography* (621)) with a developing solvent consisting of a mixture of methylene chloride, methanol, and formic acid (75:23.5:1.5), and equilibrate for 30 minutes. Separately apply 2-μL portions of the *Standard stock solution*, each of the *Standard solutions*, and the *Test solution* to a thin-layer chromatographic plate coated with a 0.25-mm layer of chromatographic silica gel. Place the plate in the chromatographic chamber, and allow the solvent front to move about two-thirds of the length of the plate. Remove the plate from the chamber, immediately spray with the *p*-Dimethylaminobenzaldehyde spray, heat the plate at 60° for 15 minutes, and promptly examine the chromatogram: no individual secondary spot observed in the chromatogram of the *Test solution* is greater in size or intensity than the principal spot observed in the chromatogram of *Standard solution 1*, corresponding to 0.5%, and the total of any such spots observed does not exceed 3.0%. [NOTE—In a valid determination, spots from all solutions must be visible.]

Assay—

Ammonium carbonate solution—Dissolve 300 mg of ammonium carbonate in 50 mL of water, and mix.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile, methanol, and Ammonium carbonate solution (475:475:50), making adjustments, if necessary (see *System Suitability under Chromatography* (621)).

Standard preparation—Prepare a solution of USP Pindolol RS in *Mobile phase* to obtain a solution having a known concentration of about 0.2 mg per mL.

Resolution solution—Dissolve a quantity of nortriptyline hydrochloride in *Standard preparation* to obtain a solution having a concentration of about 0.2 mg of nortriptyline hydrochloride per mL.

Assay preparation—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 20 mg of pindolol, to a 100-mL volumetric flask. Add 4 mL of water, and sonicate for 2 minutes, with occasional shaking to disperse the powder. Add 30 mL of *Mobile phase*, sonicate for 15 minutes, and allow to cool. Dilute with *Mobile phase* to volume, mix, and filter. Use the clear filtrate as the *Assay preparation*.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L16. The flow rate is about 3 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution between pindolol and nortriptyline is not less than 1.5. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.6 for pindolol and 1.0 for nortriptyline. Calculate the quantity, in mg, of pindolol (C₁₄H₂₀N₂O₂) in the portion of Tablets taken by the formula:

$$100C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Pindolol RS in the *Standard preparation*; and *r_U* and *r_S* are the pindolol peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Pioglitazone Hydrochloride

C₁₉H₂₀N₂O₃S · HCl 392.90
2,4-Thiazolidinedione, 5-[[4-[2-(5-ethyl-2-pyridinyl)ethoxy]phenyl]methyl]-, monohydrochloride, (±)-;
(±)-5-[p-[2-(5-Ethyl-2-pyridyl)ethoxy]benzyl]-2,4-thiazolidinedione monohydrochloride [112529-15-4].

DEFINITION

Pioglitazone Hydrochloride contains NLT 98.0% and NMT 102.0% of C₁₉H₂₀N₂O₃S · HCl, calculated on the anhydrous basis.

IDENTIFICATION

A. INFRARED ABSORPTION (197K)

• **B. IDENTIFICATION TESTS—GENERAL, Chloride (191):** Dissolve 25 mg of Pioglitazone Hydrochloride in 0.5 mL of nitric acid, and add 2 mL of dilute nitric acid. It meets the requirements of the test for *Chloride*.

• **C.** The retention time of the pioglitazone peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Mobile phase: Acetonitrile, 0.1 M ammonium acetate, and glacial acetic acid (25:25:1)

Standard solution: Prepare a 0.5 mg/mL solution of USP Pioglitazone Hydrochloride RS in methanol, and dilute with *Mobile phase* to obtain a solution containing 50 μg/mL of pioglitazone hydrochloride.

System suitability stock solution: 0.5 mg/mL of USP Pioglitazone Hydrochloride RS and 0.13 mg/mL of benzophenone in methanol

System suitability solution: Dilute *System suitability stock solution* with *Mobile phase* to obtain a solution containing 50 μg/mL of pioglitazone hydrochloride and 13 μg/mL of benzophenone.

Sample solution: Prepare a 0.5 mg/mL solution of pioglitazone hydrochloride in methanol, and dilute with *Mobile phase* to obtain a solution containing 50 μg/mL of pioglitazone hydrochloride.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 269 nm

Column: 4.6-mm × 15-cm; 5-μm packing L1

Column temperature: 25 ± 2.5°

Flow rate: 0.7 mL/min

[NOTE—Adjust the flow rate so that the retention time of the pioglitazone peak is about 7 min.]

Injection size: 20 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The approximate relative retention times for pioglitazone and benzophenone are 1.0 and 2.6, respectively.]

Suitability requirements

Tailing factor: NMT 1.5 for pioglitazone and benzophenone, *System suitability solution*

Resolution: NLT 15 between pioglitazone and benzophenone, *System suitability solution*

Relative standard deviation: NMT 2.0% for six replicate injections, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{19}H_{20}N_2O_3S \cdot HCl$ in the portion of Pioglitazone Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Pioglitazone Hydrochloride RS in the *Standard solution* (μ g/mL)

C_U = concentration of Pioglitazone Hydrochloride in the *Sample solution* (μ g/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION (281):** NMT 0.1%

Delete the following:

• **HEAVY METALS**

Sodium sulfide solution: 5 g of sodium sulfide in 10 mL of water and 30 mL of glycerin

Magnesium nitrate solution: 100 mg/mL of magnesium nitrate in alcohol

Standard solution: Place 10 mL of *Magnesium nitrate solution* in a platinum or porcelain crucible. Ignite the alcohol to burn. Cool, add 1 mL of sulfuric acid, heat carefully, and ignite at $550 \pm 50^\circ$. Cool and add 3 mL of hydrobromic acid. Proceed as directed from this point under *Sample solution*, adding 1.0 mL of *Standard Lead Solution* (see *Heavy Metals* (231), *Special Reagents*) before adding water to make 50 mL.

Sample solution: Place 1.0 g of pioglitazone hydrochloride in a platinum or porcelain crucible. Mix with 10 mL of *Magnesium nitrate solution*. Ignite the alcohol to burn, and carbonize by gradual heating. Cool, add 1 mL of sulfuric acid, heat carefully, and incinerate by ignition at $550 \pm 50^\circ$. If carbonized substances remain, moisten with a small amount of sulfuric acid, and incinerate by ignition. Cool, dissolve the residue in 3 mL of hydrobromic acid, and evaporate on a water bath to dryness. Wet the residue with 3 drops of hydrochloric acid, add 10 mL of water and dissolve by warming. Add 1 drop of phenolphthalein TS, and add ammonia TS dropwise until a pale red color develops. Add 2 mL of 1 N acetic acid, filter if necessary, wash with 10 mL of water, transfer the filtrate and washings to a Nessler tube, and add water to make 50 mL.

Analysis: Add 1 drop of *Sodium sulfide solution* to each of the tubes containing the *Standard solution* and *Sample solution*. Mix thoroughly and allow to stand for 5 min. Compare the colors of both solutions by viewing the tubes downward or transversely against a white

background. The *Sample solution* has no more color than the *Standard solution*.

Acceptance criteria: NMT 10 ppm (Official 1-Jan-2018)

Organic Impurities

• **PROCEDURE**

Mobile phase and System suitability stock solution: Proceed as directed in the Assay.

System suitability solution: Dilute the *System suitability stock solution* with *Mobile phase* to obtain a solution containing 25 μ g/mL of pioglitazone hydrochloride and 6.5 μ g/mL of benzophenone.

Sample solution: 0.2 mg/mL of pioglitazone hydrochloride dissolved in 20% of the final volume with methanol, then diluted with *Mobile phase* to final volume

Standard solution: 1 μ g/mL of pioglitazone hydrochloride prepared by diluting the *Sample solution* with *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 269 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L1

Column temperature: $25 \pm 2.5^\circ$

Flow rate: 0.7 mL/min

[NOTE—Adjust the flow rate so that the retention time of the pioglitazone peak is about 7 min.]

Injection size: 40 μ L

Run time: At least four times the retention time of pioglitazone

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5 for pioglitazone and benzophenone, *System suitability solution*

Resolution: NLT 15 between pioglitazone and benzophenone, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Pioglitazone Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times D \times 100$$

r_U = peak response of each individual impurity from the *Sample solution*

r_S = peak response of pioglitazone from the *Standard solution*

D = dilution factor used to prepare the *Standard solution*, 0.005

- **WATER DETERMINATION**, *Method 1c* (921): NMT 0.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in well-closed containers, and store at room temperature.
- **USP REFERENCE STANDARDS** (11)
USP Pioglitazone Hydrochloride RS

Pioglitazone Tablets

DEFINITION

Pioglitazone Tablets contain an amount of pioglitazone hydrochloride ($C_{19}H_{20}N_2O_3S \cdot HCl$) equivalent to NLT 95.0% and NMT 105.0% of the labeled amount of pioglitazone ($C_{19}H_{20}N_2O_3S$).

IDENTIFICATION

- **A**. The retention time of the pioglitazone peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.
- **B. ULTRAVIOLET ABSORPTION**
Sample solution: Dissolve a quantity of finely powdered Tablets in 0.1 N hydrochloric acid to obtain a solution containing 25 µg/mL of pioglitazone. [NOTE—Vigorous shaking and filtration may be needed.]
Acceptance criteria: The UV absorption spectrum exhibits a maximum between 267 and 271 nm.

ASSAY

PROCEDURE

Mobile phase: Acetonitrile, 0.1 M ammonium acetate, and glacial acetic acid (25:25:1)

Standard solution: Prepare 0.5 mg/mL solution of USP Pioglitazone Hydrochloride RS in methanol, and dilute with *Mobile phase* to obtain a solution containing 50 µg/mL of pioglitazone hydrochloride.

System suitability stock solution: 0.5 mg/mL of USP Pioglitazone Hydrochloride RS and 0.13 mg/mL of benzophenone in methanol

System suitability solution: Dilute the *System suitability stock solution* with *Mobile phase* to obtain a solution containing 50 µg/mL of pioglitazone hydrochloride and 13 µg/mL of benzophenone.

Sample solution: Weigh and finely powder NLT 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 23 mg of pioglitazone, to a glass-stoppered flask, and add 50 mL of methanol. Disperse the particles by sonication for about 2 min, then centrifuge. Dilute a portion of the supernatant with *Mobile phase* to obtain a solution having a nominal concentration of 45 µg/mL of pioglitazone.

Chromatographic system

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of $C_{19}H_{20}N_2O_3S$ in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Pioglitazone Hydrochloride RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of pioglitazone in the *Sample solution* (µg/mL)

M_{r1} = molecular weight of pioglitazone, 356.44

M_{r2} = molecular weight of pioglitazone hydrochloride, 392.90

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS

DISSOLUTION (711)

Medium: Hydrochloric acid and potassium chloride buffer, pH 2.0 [mix 50 mL of 0.2 N hydrochloric acid and 150 mL of potassium chloride solution (150 mg/mL), dilute with water to 1 L, and adjust with 5 N hydrochloric acid to a pH of 2.0]; 900 mL

Apparatus 2: 75 rpm

Time: 15 min

Standard solution: Transfer 23 mg of USP Pioglitazone Hydrochloride RS to a 50-mL volumetric flask, dissolve in 10 mL of methanol, and dilute with *Medium* to volume. Dilute this solution with *Medium* to obtain a final concentration of about L/900, where L is the label claim (mg).

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size.

Detector: UV

Analytical wavelength: 269 nm

Cell: 1 cm

Blank: *Medium*

Calculate the percentage of pioglitazone dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times (M_{r1}/M_{r2}) \times V \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

L = Tablet label claim (mg)

M_{r1} = molecular weight of pioglitazone, 356.44

M_{r2} = molecular weight of pioglitazone hydrochloride, 392.90

V = volume of *Medium* (mL), 900

Tolerances: NLT 80% (Q) of the labeled amount of pioglitazone is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

Procedure for content uniformity

Standard solution: 26 µg/mL of USP Pioglitazone Hydrochloride RS in methanol and 0.1 N hydrochloric acid (9:1)

Sample solution: Transfer 1 Tablet to an appropriate size volumetric flask such that the final concentration does not exceed 0.3 mg of pioglitazone per mL. Add 0.1 N hydrochloric acid at a volume equivalent to 10% of the total volume and shake until the Tablet is completely disintegrated. Add methanol at a volume equivalent to 70% of the total volume and shake vigorously for 10 min. Dilute with methanol to volume, mix well, and centrifuge. Dilute a portion of the supernatant with methanol and 0.1 N hydrochloric acid (9:1) to obtain a solution having a concentration of 24 µg/mL of pioglitazone.

Spectrometric conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: UV-Vis

Analytical wavelength: 269 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $C_{19}H_{20}N_2O_3S$ in the Tablet taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Pioglitazone Hydrochloride RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of pioglitazone in the *Sample solution* (µg/mL)

M_{r1} = molecular weight of pioglitazone, 356.44

M_{r2} = molecular weight of pioglitazone hydrochloride, 392.90

IMPURITIES

Organic Impurities

• **PROCEDURE**

Mobile phase and System suitability stock solution: Proceed as directed in the Assay.

Diluent: *Mobile phase* and methanol (4:1)

Standard solution: 1 µg/mL of USP Pioglitazone Hydrochloride RS in *Diluent*. [NOTE—If necessary, dissolve USP Pioglitazone Hydrochloride RS in a minimal amount of methanol and then dilute with *Diluent* to final concentration.]

System suitability solution: Dilute the *System suitability stock solution* with *Mobile phase* to obtain a solution containing 25 µg/mL of pioglitazone hydrochloride and 6.5 µg/mL of benzophenone.

Sample solution: Weigh and finely powder 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 18 mg of pioglitazone, to a 100-mL volumetric flask and add 20 mL of methanol. Disperse the particles by sonication for about 1 min, then dilute with *Mobile phase* to volume, mix well, centrifuge, and use the supernatant.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 269 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Column temperature: 25 ± 2.5°

Flow rate: 0.7 mL/min

[NOTE—Adjust the flow rate so that the retention time of the pioglitazone peak is about 7 min.]

Run time: At least 30 min

Injection size: 40 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Tailing factor: NMT 1.5 for pioglitazone and benzophenone, *System suitability solution*

Resolution: NLT 15 between pioglitazone and benzophenone, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

[NOTE—The approximate relative retention times for pioglitazone and benzophenone are 1.0 and 2.6, respectively.]

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of each individual impurity from the *Sample solution*

r_S = peak response of pioglitazone from the *Standard solution*

C_S = concentration of USP Pioglitazone Hydrochloride RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of pioglitazone in the *Sample solution* (µg/mL)

M_{r1} = molecular weight of pioglitazone, 356.44

M_{r2} = molecular weight of pioglitazone hydrochloride, 392.90

Acceptance criteria

Individual impurities: NMT 0.2%

Total impurities: NMT 0.6%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers and store at controlled room temperature.
- **USP REFERENCE STANDARDS (11)**
USP Pioglitazone Hydrochloride RS

Pioglitazone and Glimepiride Tablets

DEFINITION

Pioglitazone and Glimepiride Tablets contain an amount of pioglitazone hydrochloride ($C_{19}H_{20}N_2O_3S \cdot HCl$) equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of pioglitazone ($C_{19}H_{20}N_2O_3S$), and NLT 90.0% and NMT 110.0% of the labeled amount of glimepiride ($C_{24}H_{34}N_4O_5S$).

IDENTIFICATION

• **A. ULTRAVIOLET ABSORPTION**

Sample: Transfer 1 Tablet to a suitable container, and add 0.1 N hydrochloric acid to obtain a final concentration of about 0.1 mg/mL of glimepiride. Shake until the Tablet disintegrates. Pass a 2-mL portion of the resulting suspension through a suitable filter of 0.45-µm pore size. Use the filtrate for the identification of pioglitazone, and use the filter for the identification of glimepiride.

Pioglitazone

Sample solution: Dilute a portion of the filtrate obtained in the *Sample* with 0.1 N hydrochloric acid to obtain a solution containing about 0.03 mg/mL of pioglitazone.

Acceptance criteria: The UV absorption spectrum exhibits a maximum between 267 and 271 nm.

Glimepiride

Sample solution: Wash the filter, as obtained in the *Sample*, with 100 mL of 0.1 N hydrochloric acid, and discard the filtrate. Wash the filter with 20 mL of methanol, and use the filtrate.

Acceptance criteria: The UV absorption spectrum exhibits a maximum between 227 and 231 nm.

- **B.** The retention times of the pioglitazone and glimepiride peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **PROCEDURE**

Buffer: 6.9 g/L of monobasic sodium phosphate in water, adjusted with diluted phosphoric acid to a pH of 4.0

Mobile phase: Acetonitrile and *Buffer* (1:1)

Diluent: Acetonitrile and 0.1 N hydrochloric acid (9:1)

Standard stock solution: 0.66 mg/mL of USP Pioglitazone Hydrochloride RS and 0.08 mg/mL of USP Glimepiride RS in *Diluent*

Standard solution: 66 µg/mL of pioglitazone hydrochloride and 8 µg/mL of glimepiride in *Mobile phase* from the *Standard stock solution*

Resolution stock solution: Dilute 1.0 mL of ethyl benzoate with *Mobile phase* to 100 mL. Further dilute 1.0 mL of the resulting solution with *Mobile phase* to 100 mL.

System suitability solution: Transfer 5.0 mL of the *Standard stock solution* and 5.0 mL of the *Resolution stock solution* to a 50-mL volumetric flask, and dilute with *Mobile phase* to volume.

Sample stock solution: Transfer 20 Tablets to a suitable container. Add 200.0 mL of *Diluent*, and shake vigorously for at least 20 min. If disintegration is not complete, sonicate until the Tablets are completely disintegrated, and then shake for an additional 10 min. Pass through a suitable filter of 0.2-µm pore size, discarding the first few mL of filtrate. Further dilute 5.0 mL of the filtrate with *Diluent* to 50.0 mL.

Sample solution: Transfer 10.0 mL of the *Sample stock solution* to a 50-mL volumetric flask, and dilute with *Mobile phase* to volume to obtain a solution with the nominal concentrations listed in *Table 1*.

Table 1

Labeled Amounts of Pioglitazone and Glimepiride (mg/Tablet)	Nominal Concentrations in the <i>Sample solution</i>	
	Pioglitazone (µg/mL)	Glimepiride (µg/mL)
30 and 2	60	4
30 and 4	60	8

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 228 nm

Column: 4.6-mm × 5-cm; 3-µm packing L1

Column temperature: 25 ± 5°

Flow rate: 0.8 mL/min. [NOTE—The flow rate may be adjusted to achieve the retention time of the pioglitazone peak of about 2.3 min.]

Injection volume: 20 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—See *Table 2* for the approximate relative retention times.]

Table 2

Name	Relative Retention Time
Pioglitazone	1.0
Ethyl benzoate	1.7
Glimepiride	2.3

Suitability requirements

Resolution: NLT 4 between pioglitazone and ethyl benzoate; NLT 3 between ethyl benzoate and glimepiride, *System suitability solution*

Relative standard deviation: NMT 1.0% for the pioglitazone peak; NMT 1.0% for the glimepiride peak, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of pioglitazone ($C_{19}H_{20}N_2O_3S$) in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times (M_{r1}/M_{r2}) \times 100$$

r_u = peak response of pioglitazone from the *Sample solution*

r_s = peak response of pioglitazone from the *Standard solution*

C_s = concentration of USP Pioglitazone Hydrochloride RS in the *Standard solution* (µg/mL)

C_u = nominal concentration of pioglitazone in the *Sample solution* (µg/mL)

M_{r1} = molecular weight of pioglitazone, 356.44

M_{r2} = molecular weight of pioglitazone hydrochloride, 392.90

Calculate the percentage of the labeled amount of glimepiride ($C_{24}H_{34}N_4O_5S$) in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response of glimepiride from the *Sample solution*

r_s = peak response of glimepiride from the *Standard solution*

C_s = concentration of USP Glimepiride RS in the *Standard solution* (µg/mL)

C_u = nominal concentration of glimepiride in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0% for each of the labeled amounts of pioglitazone and glimepiride

PERFORMANCE TESTS• **DISSOLUTION (711)****Test 1****Pioglitazone**

Medium: Hydrochloric acid buffer pH 2.0 (see *Reagents, Indicators, and Solutions—Buffer Solutions*); 900 mL

Apparatus 2: 75 rpm

Time: 15 min

Mobile phase and Chromatographic system: Proceed as directed in the *Assay*.

Standard stock solution: 0.37 mg/mL of USP Pioglitazone Hydrochloride RS dissolved first in methanol using 20% of the final volume, and then diluted with *Medium* to volume

Standard solution: Transfer 10.0 mL of the *Standard stock solution* to a 100-mL volumetric flask, and dilute with *Medium* to volume.

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements for *Content Uniformity* for pioglitazone and glimepiride

IMPURITIES

• ORGANIC IMPURITIES: PIOGLITAZONE

Mobile phase: Acetonitrile, 0.1 M ammonium acetate, and glacial acetic acid (25:25:1)

Diluent: Acetonitrile and 0.1 N hydrochloric acid (9:1)

Standard stock solution: 0.2 mg/mL of USP Pioglitazone Hydrochloride RS in *Diluent*

Standard solution: 2 μ g/mL of USP Pioglitazone Hydrochloride RS in *Mobile phase* from the *Standard stock solution*

Resolution stock solution: Dilute 1.0 mL of ethyl benzoate to 100.0 mL with acetonitrile. Further dilute 1.0 mL of the resulting solution with acetonitrile to 100.0 mL.

System suitability solution: Transfer 2.0 mL of the *Resolution stock solution* into a 100-mL volumetric flask. Add 1.0 mL of the *Standard stock solution*, and dilute with *Mobile phase* to volume.

Sample stock solution: Transfer 10 Tablets to an appropriate volumetric flask such that the nominal glimepiride concentration is 0.4 mg/mL. Add *Diluent* to approximately 80% of the total volume. Shake vigorously for at least 20 min, and dilute with *Diluent* to volume. Pass through a suitable filter of 0.2- μ m pore size, discarding the first few mL of filtrate.

Sample solution: Transfer a suitable volume of the *Sample stock solution* to a 25-mL volumetric flask, and dilute with *Mobile phase* to volume to obtain a solution containing 240 μ g/mL of pioglitazone.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 269 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L1

Column temperature: $25 \pm 5^\circ$

Flow rate: 0.8 mL/min. [NOTE—The flow rate may be adjusted to achieve the retention time of the pioglitazone peak of about 7 min.]

Injection volume: 40 μ L

Run time: At least 4 times the retention time of the pioglitazone peak

System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—Elution order is the pioglitazone peak followed by ethyl benzoate.]

Suitability requirements

Resolution: NLT 10 between pioglitazone and ethyl benzoate, *System suitability solution*

Tailing factor: NMT 1.5 for the pioglitazone peak, *System suitability solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each pioglitazone related impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of each individual impurity from the *Sample solution*

r_S = peak response of pioglitazone from the *Standard solution*

C_S = concentration of USP Pioglitazone Hydrochloride RS in the *Standard solution* (μ g/mL)

C_U = nominal concentration of pioglitazone in the *Sample solution* (μ g/mL)

M_{r1} = molecular weight of pioglitazone, 356.44

M_{r2} = molecular weight of pioglitazone hydrochloride, 392.90

Acceptance criteria

Any individual pioglitazone related impurity: NMT 0.2%

Total pioglitazone related impurities: NMT 0.6% [NOTE—Disregard the peak due to glimepiride, which elutes at about 16.5 min.]

• ORGANIC IMPURITIES: GLIMEPIRIDE

Buffer: 0.007 M sodium phosphate, pH 1.6 (0.97 g/L of monobasic sodium phosphate in water, adjusted with dilute phosphoric acid to a pH of 1.6)

Diluent: Acetonitrile and 0.1 N hydrochloric acid (9:1)

Solution A: Acetonitrile and *Buffer* (52:48)

Solution B: Acetonitrile and *Buffer* (70:30)

Mobile phase: See *Table 3*.

Table 3

Time (min)	Solution A (%)	Solution B (%)
0	100	0
15	100	0
60	0	100
60.1	100	0
70	100	0

Standard stock solution: 0.2 mg/mL of USP Glimepiride RS in *Diluent*

Standard solution: 2 μ g/mL of USP Glimepiride RS in *Solution A* from the *Standard stock solution*

Resolution stock solution: Dilute 1.0 mL of ethyl benzoate with acetonitrile to 100.0 mL. Further dilute 1.0 mL of the resulting solution with acetonitrile to 100.0 mL.

System suitability solution: Transfer 2 mL of the *Resolution stock solution* into a 100-mL volumetric flask, add 1.0 mL of the *Standard stock solution*, and dilute with *Solution A* to volume.

Sample stock solution: Transfer 10 Tablets to an appropriate volumetric flask such that the nominal glimepiride concentration is 0.4 mg/mL. Add *Diluent* to approximately 80% of the total volume. Shake vigorously for at least 20 min, and dilute with *Diluent* to volume.

Pass through a suitable filter of 0.2- μ m pore size, discarding the first few mL of filtrate.

Sample solution: Equivalent to 0.2 mg/mL glimepiride in *Solution A* from the *Sample stock solution*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 228 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Column temperature: 25 \pm 5°

Flow rate: 1.0 mL/min. [NOTE—The flow rate may be adjusted to achieve the retention time of the glimepiride peak of about 25 min.]

Injection volume: 40 μ L

System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—Elution order is ethyl benzoate followed by glimepiride.]

Suitability requirements

Change to read:

• A. ULTRAVIOLET ABSORPTION (17U)

[NOTE—The UV spectra of the major peaks of the *Sample solution* and the *Standard solution* as obtained in the *Assay* may also be used to meet the *Acceptance criteria*.] (RB 1-Jun-2016)

Pioglitazone

Sample solution: Transfer a quantity of finely powdered Tablets to a suitable container, and add water to obtain a final concentration of about 0.03 mg/mL of pioglitazone. Sonicate for about 30 s. Pass through a 5-mL portion of the resulting suspension using a suitable filter of 0.45- μ m pore size, then wash the filter with 10 mL of water, and discard the filtrate. Wash the filter with 5 mL of 0.1 N hydrochloric acid, and use the filtrate.

Acceptance criteria: The UV absorption spectrum exhibits a maximum between λ_{265} (RB 1-Jun-2016) and 271 nm.

Metformin hydrochloride

Sample solution: Transfer a quantity of finely powdered Tablets to a suitable container, and add a suitable quantity of water, based on the labeled amount of metformin hydrochloride in the sample, to obtain a final concentration of about 0.4 mg/mL of metformin hydrochloride. Sonicate for about 30 s, and pass through a suitable filter of 0.45- μ m pore size, discarding the first few mL of filtrate. Dilute a portion of the filtrate with water to obtain a solution containing about 8 μ g/mL of metformin hydrochloride.

Acceptance criteria: The UV absorption spectrum exhibits a maximum between 230 and λ_{235} (RB 1-Jun-2016) nm.

- B.** The retention times of the pioglitazone and metformin peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

ASSAY

Change to read:

• PROCEDURE

Mobile phase: 7.2 g/L of sodium dodecyl sulfate in a mixture of 0.05 M monobasic ammonium phosphate and acetonitrile (1:1)

Diluent: Methanol and 0.1 N hydrochloric acid (1:1)

System suitability stock solution: 0.5 mg/mL of *p*-methoxyacetophenone and 0.4 mg/mL of butylparaben in *Diluent*

Pioglitazone standard stock solution: 0.84 mg/mL of USP Pioglitazone Hydrochloride RS in *Diluent*

Mixed standard stock solution: 2.5 mg/mL of USP Metformin Hydrochloride RS and 0.084 mg/mL of USP Pioglitazone Hydrochloride RS in 0.1 N hydrochloric acid from the *Pioglitazone standard stock solution*.

System suitability solution: Transfer 10.0 mL of the *Mixed standard stock solution* and 5.0 mL of the *System suitability stock solution* to a 50-mL volumetric flask, and dilute with 0.1 N hydrochloric acid to volume.

Standard solution: 16.8 µg/mL of USP Pioglitazone Hydrochloride RS and 0.5 mg/mL of USP Metformin Hydrochloride RS in 0.1 N hydrochloric acid from the *Mixed standard stock solution*.

Sample stock solution: Weigh and finely powder NLT 10 Tablets. Transfer an amount of powdered Tablets, equivalent to about 15 mg of pioglitazone, to a 200-mL volumetric flask. Add 120 mL of 0.1 N hydrochloric acid, shake for about 30 min, and then sonicate for about 5 min. Dilute with 0.1 N hydrochloric acid to volume, and mix well. Pass through a suitable filter of 0.45-µm pore size, discarding the first few mL of filtrate.

Sample solution: Transfer a suitable volume of the *Sample stock solution* (see Table 1) to a 50-mL volumetric flask, and dilute with 0.1 N hydrochloric acid to volume.

Table 1

Labeled Amount of Pioglitazone and Metformin Hydrochloride (mg/Tablet)	Volume of Sample Stock Solution Used to Prepare the Sample Solution (mL)	Nominal Concentrations in the Sample Solution	
		Pioglitazone (µg/mL)	Metformin Hydrochloride (mg/mL)
15 and 500	10	15	0.5
15 and 850	5	7.5	0.425

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 255 nm for metformin and *p*-methoxyacetophenone; UV 225 nm for pioglitazone and butylparaben. *If this procedure is used for *Identification A*, use a diode-array detector set at 200–400 nm.

• (RB 1-Jun-2016)

Column: 6.0-mm × 15-cm; 5-µm packing L7

Column temperature: 25 ± 5°

Flow rate: 1 mL/min. [NOTE—The flow rate may be adjusted to achieve the retention time of the metformin peak of about 5 min.]

Injection volume: 10 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—See Table 2 for the approximate relative retention times.]

Table 2

Name	Relative Retention Time
Metformin	1.0
<i>p</i> -Methoxyacetophenone	1.2
Pioglitazone	1.8
Butylparaben	2.1

Suitability requirements

Resolution: NLT 2.5 between metformin and *p*-methoxyacetophenone; NLT 2.5 between pioglitazone and butylparaben, *System suitability solution*

Relative standard deviation: NMT 1.0% for the metformin peak; NMT 1.0% for pioglitazone peak, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of pioglitazone (C₁₉H₂₀N₂O₃S) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of pioglitazone from the *Sample solution*

r_S = peak response of pioglitazone from the *Standard solution*

C_S = concentration of USP Pioglitazone Hydrochloride RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of pioglitazone in the *Sample solution* (µg/mL)

M_{r1} = molecular weight of pioglitazone, 356.44

M_{r2} = molecular weight of pioglitazone hydrochloride, 392.90

Calculate the percentage of the labeled amount of metformin hydrochloride (C₄H₁₁N₅ · HCl) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of metformin from the *Sample solution*

r_S = peak response of metformin from the *Standard solution*

C_S = concentration of USP Metformin Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of metformin hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0% for each of the labeled amounts of pioglitazone and metformin hydrochloride

PERFORMANCE TESTS

• DISSOLUTION (711)

Test 1

Medium: pH 2.5 McIlvaine buffer (could be prepared by adjusting 0.1 M citric acid with 0.2 M dibasic sodium phosphate to a pH of 2.5); 900 mL

Apparatus 2: 50 rpm

Time: 30 min

Diluent and Mobile phase: Proceed as directed in the *Assay*.

Pioglitazone standard stock solution: 0.37 mg/mL of USP Pioglitazone Hydrochloride RS in *Diluent*

Standard solution: 0.0185 mg/mL of USP Pioglitazone Hydrochloride RS from the *Pioglitazone standard stock solution* and (L/900) mg/mL of USP Metformin Hydrochloride RS in *Medium*, where L is the label claim, in mg/Tablet, of metformin hydrochloride

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size.

Chromatographic system: Proceed as directed in the *Assay*, except use an *Injection volume* of 5 µL.

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.5 for the metformin peak; NMT 2.0 for the pioglitazone peak

Relative standard deviation: NMT 2.0% for the metformin peak; NMT 2.0% for the pioglitazone peak

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of pioglitazone ($C_{19}H_{20}N_2O_3S$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times (M_{r1}/M_{r2}) \times 100$$

- r_U = peak response of pioglitazone from the *Sample solution*
 r_S = peak response of pioglitazone from the *Standard solution*
 C_S = concentration of USP Pioglitazone Hydrochloride RS in the *Standard solution* (mg/mL)
 L = label claim of pioglitazone (mg/Tablet)
 V = volume of *Medium*, 900 mL
 M_{r1} = molecular weight of pioglitazone, 356.44
 M_{r2} = molecular weight of pioglitazone hydrochloride, 392.90

Calculate the percentage of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

- r_U = peak response of metformin hydrochloride from the *Sample solution*
 r_S = peak response of metformin hydrochloride from the *Standard solution*
 C_S = concentration of USP Metformin Hydrochloride RS in the *Standard solution* (mg/mL)
 L = label claim of metformin hydrochloride (mg/Tablet)
 V = volume of *Medium*, 900 mL

Tolerances: NLT 80% (Q) of the labeled amount of pioglitazone ($C_{19}H_{20}N_2O_3S$) is dissolved; NLT 80% (Q) of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) is dissolved.

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: pH 2.5 McIlvaine buffer (could be prepared by adjusting 0.1 M citric acid with 0.2 M dibasic sodium phosphate to a pH of 2.5); 900 mL

Apparatus 2: 50 rpm

Time: 45 min

Solution A: 1.4 g/L of dibasic sodium phosphate anhydrous and 1.4 g/L of sodium dodecyl sulfate in water

Solution B: Phosphoric acid and water (50:50)

Mobile phase: Acetonitrile and *Solution A* (34:66). Adjust with *Solution B* to a pH of 7.1.

Diluent A: Acetonitrile and *Medium* (50:50)

Diluent B: Acetonitrile and water (70:30)

Pioglitazone standard stock solution: 0.019 mg/mL of USP Pioglitazone Hydrochloride RS in *Diluent B*. Sonicate as needed to dissolve.

Metformin standard stock solution: 0.92 mg/mL of USP Metformin Hydrochloride RS in *Medium*. Sonicate as needed to dissolve.

Standard solution: 0.003 mg/mL of USP Pioglitazone Hydrochloride RS from the *Pioglitazone standard stock solution* and 0.11 mg/mL of USP Metformin Hydrochloride RS in *Diluent A*

Sample solution: Pass a portion of the solution under test through a suitable filter and dilute with *Diluent A* to a metformin concentration that is similar to the *Standard solution*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L1

Temperatures

Autosampler: 5°

Column: 40°

Flow rate: 1 mL/min

Injection volume: 15 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: 0.8–2.0 for the metformin peak;

0.8–2.0 for the pioglitazone peak

Relative standard deviation: NMT 2.0% for the metformin peak; NMT 2.5% for the pioglitazone peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of pioglitazone ($C_{19}H_{20}N_2O_3S$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times D \times (M_{r1}/M_{r2}) \times 100$$

- r_U = peak response of pioglitazone from the *Sample solution*
 r_S = peak response of pioglitazone from the *Standard solution*
 C_S = concentration of USP Pioglitazone Hydrochloride RS in the *Standard solution* (mg/mL)
 L = label claim of pioglitazone (mg/Tablet)
 V = volume of *Medium*, 900 mL
 D = dilution factor of the *Sample solution*
 M_{r1} = molecular weight of pioglitazone, 356.44
 M_{r2} = molecular weight of pioglitazone hydrochloride, 392.90

Calculate the percentage of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times D \times 100$$

- r_U = peak response of metformin hydrochloride from the *Sample solution*
 r_S = peak response of metformin hydrochloride from the *Standard solution*
 C_S = concentration of USP Metformin Hydrochloride RS in the *Standard solution* (mg/mL)
 L = label claim of metformin hydrochloride (mg/Tablet)
 V = volume of *Medium*, 900 mL
 D = dilution factor of the *Sample solution*

Tolerances: NLT 80% (Q) of the labeled amount of pioglitazone ($C_{19}H_{20}N_2O_3S$) is dissolved; NLT 80% (Q) of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905), Content Uniformity:** Meet the requirements for pioglitazone and metformin hydrochloride

IMPURITIES• **ORGANIC IMPURITIES: PIOGLITAZONE**

Mobile phase: Acetonitrile, 0.1 M ammonium acetate, and glacial acetic acid (25:25:1)

Diluent: Methanol and 0.1 N hydrochloric acid (1:1)

Standard stock solution: 0.2 mg/mL of USP Pioglitazone Hydrochloride RS, dissolved first in methanol using 20% of the final volume, then diluted with *Mobile phase* to volume

System suitability solution: Prepare a solution containing 0.3 mg/mL of benzophenone in methanol. Transfer 1.0 mL of this solution to a 50-mL volumetric flask, add 5.0 mL of the *Standard stock solution*, and dilute with *Mobile phase* to volume. This solution contains 20 μ g/

mL of USP Pioglitazone Hydrochloride RS and 6 µg/mL of benzophenone.

Standard solution: 1 µg/mL of USP Pioglitazone Hydrochloride RS in *Mobile phase* from the *Standard stock solution*

Sample solution: Weigh and finely powder 10 Tablets. Transfer an amount of powdered Tablets, equivalent to about 18 mg of pioglitazone, to a 100-mL volumetric flask, and add 50 mL of *Diluent*. Shake for 30 min, and dilute with *Mobile phase* to volume. Pass through a suitable filter of 0.45-µm pore size, discarding the first few mL of filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 269 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Column temperature: 25 ± 5°

Flow rate: 0.8 mL/min. [NOTE—The flow rate may be adjusted to achieve the retention time of the pioglitazone peak of about 7 min.]

Injection volume: 40 µL

Run time: At least 4 times the retention time of the pioglitazone peak

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—Elution order is the pioglitazone peak followed by benzophenone.]

Suitability requirements

Resolution: NLT 10 between pioglitazone and benzophenone, *System suitability solution*

Tailing factor: NMT 1.5 for the pioglitazone peak, *System suitability solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each pioglitazone related impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of each individual impurity from the *Sample solution*

r_S = peak response of pioglitazone from the *Standard solution*

C_S = concentration of USP Pioglitazone Hydrochloride RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of pioglitazone in the *Sample solution* (µg/mL)

M_{r1} = molecular weight of pioglitazone, 356.44

M_{r2} = molecular weight of pioglitazone hydrochloride, 392.90

Acceptance criteria

Any individual pioglitazone related impurity: NMT 0.2%

Total pioglitazone related impurities: NMT 0.6%

[NOTE—Disregard the peaks due to metformin and its impurities that elute before 4.5 min, corresponding to the relative retention time of the pioglitazone peak of about 0.64.]

• ORGANIC IMPURITIES: METFORMIN

Solution A: 1.74 g of sodium 1-pentanesulfonate and 1.15 g of monobasic ammonium phosphate in 1000 mL of water

Solution B: Acetonitrile and water (7:3)

Mobile phase: See *Table 3*.

Table 3

Time (min)	Solution A (%)	Solution B (%)
0	100	0
15	70	30
15.1	0	100
25	0	100
25.1	100	0
35	100	0

System suitability solution: 5 µg/mL of USP Metformin Hydrochloride RS and 2 µg/mL of melamine in water

Standard solution: 5 µg/mL of USP Metformin Hydrochloride RS in water

Sample solution: Accurately weigh 10 Tablets, and finely powder. Transfer an amount of powdered Tablets, equivalent to about 100 mg of metformin hydrochloride, to a 100-mL volumetric flask, and add 50 mL of water. Shake for 30 min. Dilute with water to volume, and pass through a suitable filter of 0.45-µm pore size, discarding the first few mL of filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm × 15-cm; 5-µm packing L62

Column temperature: 25 ± 5°

Flow rate: 1.0 mL/min. [NOTE—The flow rate may be adjusted to achieve the retention time of the metformin peak of about 8 min.]

Run time: 15 min

Injection volume: 20 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for melamine and metformin are about 0.9 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 4 between melamine and metformin hydrochloride, *System suitability solution*

Tailing factor: NMT 1.5 for the metformin hydrochloride peak, *System suitability solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each metformin hydrochloride related impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each individual impurity from the *Sample solution*

r_S = peak response of metformin hydrochloride from the *Standard solution*

C_S = concentration of USP Metformin Hydrochloride RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of metformin hydrochloride in the *Sample solution* (µg/mL)

Acceptance criteria

Any individual impurity: NMT 0.1%

Total impurities: NMT 0.5%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.

• **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.

- **USP REFERENCE STANDARDS (11)**
USP Metformin Hydrochloride RS
USP Pioglitazone Hydrochloride RS

Piperacillin

$C_{23}H_{27}N_5O_7S \cdot H_2O$ 535.57

$C_{23}H_{27}N_5O_7S$ 517.56

4-Thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, 6-[[[(4-ethyl-2,3-dioxo-1-piperazinyl)carbonyl]amino]phenylacetyl]amino]-3,3-dimethyl-7-oxo-, monohydrate, [2S-2 α ,5 α ,6 β (S*)];

(2S,5R,6R)-6-[(R)-2-(4-Ethyl-2,3-dioxo-1-piperazinecarboxamido)-2-phenylacetamido]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid monohydrate [66258-76-2].

Anhydrous [61477-96-1].

DEFINITION

Piperacillin contains NLT 960 μ g/mg and NMT 1030 μ g/mg of piperacillin ($C_{23}H_{27}N_5O_7S$), calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**

ASSAY

- **PROCEDURE**

Mobile phase: Methanol, water, 0.2 M monobasic sodium phosphate, and 0.4 M tetrabutylammonium hydroxide (450:447:100:3). Adjust with phosphoric acid to a pH of 5.50.

System suitability solution: 0.1 mg/mL of USP Ampicillin RS and 0.2 mg/mL of USP Piperacillin RS in *Mobile phase*.

Standard solution: 0.4 mg/mL of USP Piperacillin RS in *Mobile phase*. Dissolve in a few drops of methanol, and dilute with *Mobile phase* to volume. Use this solution within 1 h.

Sample solution: 0.4 mg/mL of Piperacillin in *Mobile phase*. Dissolve in a few drops of methanol, and dilute with *Mobile phase* to volume. Use this solution within 1 h.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Flow rate: 1 mL/min

Injection volume: 10 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—See *Table 1* for the relative retention times.]

Suitability requirements

Resolution: NLT 16 between ampicillin and piperacillin, *System suitability solution*

Tailing factor: NMT 1.2 for the piperacillin peak, *System suitability solution*

Relative standard deviation: NMT 2%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the potency of piperacillin ($C_{23}H_{27}N_5O_7S$) in the portion of Piperacillin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Piperacillin RS in the *Standard solution* (mg/mL)

C_U = concentration of the *Sample solution* (mg/mL)

P = potency of piperacillin in USP Piperacillin RS (μ g/mg)

Acceptance criteria: 960–1030 μ g/mg on the anhydrous basis

IMPURITIES

Delete the following:

- **HEAVY METALS, Method II (231):** NMT 20 ppm (Official 1-Jan-2018)

- **AMPICILLIN, PIPERACILLIN PENICILLOIC ACID, PIPERACILLIN RELATED COMPOUND E, AND ACETYLATED PENICILLOIC ACID OF PIPERACILLIN**

Mobile phase, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Standard solution 1: 0.08 mg/mL of USP Ampicillin RS in *Mobile phase*

Standard solution 2: 0.04 mg/mL of USP Piperacillin RS in *Mobile phase*. Dissolve in a few drops of methanol, and dilute with *Mobile phase* to volume. Use this solution within 1 h.

Analysis

Samples: *Standard solution 1*, *Standard solution 2*, and *Sample solution*

Calculate the percentage of ampicillin in the portion of Piperacillin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

r_U = peak response of ampicillin from the *Sample solution*

r_S = peak response of ampicillin from *Standard solution 1*

C_S = concentration of USP Ampicillin RS in *Standard solution 1* (mg/mL)

C_U = concentration of the *Sample solution* (mg/mL)

P = potency of ampicillin in USP Ampicillin RS (μ g/mg)

F = conversion factor, 0.001 mg/ μ g

Calculate the percentages of specified impurities other than ampicillin in the portion of Piperacillin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times (1/F_1) \times F_2 \times 100$$

r_U = peak response of each specified impurity other than ampicillin from the *Sample solution*

r_S = peak response of piperacillin from *Standard solution 2*

C_S = concentration of USP Piperacillin RS in *Standard solution 2* (mg/mL)

C_U = concentration of the *Sample solution* (mg/mL)

P = potency of piperacillin in USP Piperacillin RS (μ g/mg)

F_1 = relative response factor (see *Table 1*)

F_2 = conversion factor, 0.001 mg/ μ g

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Piperacillin related compound E ^a	0.24	2.4	0.2
Ampicillin	0.31	1.0	0.2
Acetylated penicillic acid of piperacillin ^b	0.37	1.1	0.4
Piperacillin penicillic acid ^c	0.62	0.7	1.0
Piperacillin	1.0	—	—

^a 1-Ethyl-2,3-piperazinedione.

^b (2*R*,4*S*)-3-Acetyl-2-[(1*R*)-carboxy[2-(4-ethyl-2,3-dioxopiperazine-1-carboxamido)-2-phenylacetamido]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid.

^c (2*R*,4*S*)-2-[(1*R*)-Carboxy[2-(4-ethyl-2,3-dioxopiperazine-1-carboxamido)-2-phenylacetamido]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid.

• PIPERACILLINYLAMPICILLIN

Mobile phase: Methanol, water, 0.2 M monobasic sodium phosphate, and 0.4 M tetrabutylammonium hydroxide (615:282:100:3). Adjust with phosphoric acid to a pH of 5.50.

Standard solution: 0.04 mg/mL of USP Piperacillin RS in *Mobile phase*. Dissolve in a few drops of methanol, and dilute with *Mobile phase* to volume. Use this solution within 1 h.

Sample solution: 0.4 mg/mL of Piperacillin in *Mobile phase*. Dissolve in a few drops of methanol, and dilute with *Mobile phase* to volume. Use this solution within 1 h.

Chromatographic system

Flow rate: 1 mL/min

Injection volume: 10 μL

System suitability

Sample: *Standard solution*

[NOTE—See Table 2 for the relative retention times.]

Suitability requirements

Relative standard deviation: NMT 2%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of piperacillinylampicillin in the portion of Piperacillin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times (1/F_1) \times F_2 \times 100$$

r_U = peak response of piperacillinylampicillin from the *Sample solution*

r_S = peak response of piperacillin from the *Standard solution*

C_S = concentration of USP Piperacillin RS in the *Standard solution* (mg/mL)

C_U = concentration of the *Sample solution* (mg/mL)

P = potency of piperacillin in USP Piperacillin RS (μg/mg)

F_1 = relative response factor (see Table 2)

F_2 = conversion factor, 0.001 mg/μg

Acceptance criteria: See Table 2.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Piperacillin	1.0	—	—
Piperacillinylampicillin ^a	2.55	0.7	2.0
Total impurities ^b	—	—	3.8

^a (2*S*,5*R*,6*R*)-6-[(*R*)-2-[(2*S*,5*R*,6*R*)-6-[(*R*)-2-(4-Ethyl-2,3-dioxopiperazine-1-carboxamido)-2-phenylacetamido]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxamido)-2-phenylacetamido]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid.

^b Total impurities is the sum of all impurities reported in the tests for Ampicillin, Piperacillin Penicillic Acid, Piperacillin Related Compound E, and Acetylated Penicillic Acid of Piperacillin, and Piperacillinylampicillin.

SPECIFIC TESTS

• **WATER DETERMINATION, Method I** <921>: 2.0%–4.0%

• **OPTICAL ROTATION, Specific Rotation** <781S>

Sample solution: 40 mg/mL in methanol

Acceptance criteria: +155° to +175°

• **BACTERIAL ENDOTOXINS TEST** <85>: Where the label states that Piperacillin is sterile or that it must be subjected to further processing during the preparation of injectable dosage forms, it contains NMT 0.07 USP Endotoxin Unit/mg of piperacillin.

• **STERILITY TESTS** <71>: Where the label states that Piperacillin is sterile or that it must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements when tested as directed in *Test for Sterility of the Product to Be Examined, Membrane Filtration*.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **LABELING:** Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

• **USP REFERENCE STANDARDS** <11>

USP Ampicillin RS

USP Endotoxin RS

USP Piperacillin RS

Piperacillin Sodium

$C_{23}H_{26}N_5NaO_7S$ 539.54

4-Thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, 6-[[[(4-ethyl-2,3-dioxo-1-piperazinyl)carbonyl]amino]phenylacetyl]amino]-3,3-dimethyl-7-oxo-, monosodium salt, [2*S*]-[2*α*,5*α*,6*β*(*S*^{*})];

Sodium (2*S*,5*R*,6*R*)-6-[(*R*)-2-(4-ethyl-2,3-dioxo-1-piperazine-carboxamido)-2-phenylacetamido]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate [59703-84-3].

DEFINITION

Piperacillin Sodium has a potency equivalent to NLT 863 μg/mg and NMT 1007 μg/mg of piperacillin ($C_{23}H_{27}N_5O_7S$), calculated on the anhydrous basis.

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, and the chromatogram compares qualitatively to that of the *Standard solution*, as obtained in the *Assay*.
- **B. IDENTIFICATION TESTS—GENERAL, Sodium (191)**

ASSAY• **PROCEDURE**

Mobile phase: Methanol, water, 0.2 M monobasic sodium phosphate, and 0.4 M tetrabutylammonium hydroxide (450:447:100:3). Adjust with phosphoric acid to a pH of 5.50.

System suitability solution: 0.1 mg/mL of USP Ampicillin RS and 0.2 mg/mL of USP Piperacillin RS in *Mobile phase*

Standard solution 1: 0.4 mg/mL of USP Piperacillin RS in *Mobile phase*. Dissolve in a few drops of methanol, and dilute with *Mobile phase* to volume. Use this solution within 1 h.

Sample solution: 0.4 mg/mL of Piperacillin Sodium in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 1 mL/min

Injection volume: 10 μL

System suitability

Samples: *System suitability solution* and *Standard solution 1*

[NOTE—See *Table 1* for the relative retention times.]

Suitability requirements

Resolution: NLT 16 between ampicillin and piperacillin, *System suitability solution*

Tailing factor: NMT 1.2 for the piperacillin peak, *System suitability solution*

Relative standard deviation: NMT 2% for the piperacillin peak, *Standard solution 1*

Analysis

Samples: *Standard solution 1* and *Sample solution*

Calculate the potency, in μg/mg, of piperacillin (C₂₃H₂₇N₅O₇S) in the portion of Piperacillin Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P$$

r_U = peak response from the *Sample solution*

r_S = peak response from *Standard solution 1*

C_S = concentration of USP Piperacillin RS in *Standard solution 1* (mg/mL)

C_U = concentration of the *Sample solution* (mg/mL)

P = potency of piperacillin in USP Piperacillin RS (μg/mg)

Acceptance criteria: 863–1007 μg/mg on the anhydrous basis

IMPURITIES• **PIPERACILLIN PENICILLOIC ACID AND ACETYLATED PENICILLOIC ACID OF PIPERACILLIN**

Mobile phase, Standard solution 1, and Sample solution: Prepare as directed in the *Assay*.

System suitability solution: 0.1 mg/mL of USP Ampicillin RS and 0.2 mg/mL of USP Piperacillin RS in *Mobile phase*

Standard solution 2: 0.04 mg/mL of USP Piperacillin RS in *Mobile phase*. Dissolve in a few drops of methanol, and dilute with *Mobile phase* to volume. Use this solution within 1 h.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 1 mL/min

Injection volume: 10 μL

System suitability

Samples: *Standard solution 1* and *System suitability solution*

[NOTE—See *Table 1* for the relative retention times.]

Suitability requirements

Resolution: NLT 16 between ampicillin and piperacillin, *System suitability solution*

Tailing factor: NMT 1.2 for the piperacillin peak, *System suitability solution*

Relative standard deviation: NMT 2% for the piperacillin peak, *Standard solution 1*

Analysis

Samples: *Sample solution* and *Standard solution 2*

Calculate the percentages of piperacillin penicilloic acid and acetylated penicilloic acid of piperacillin in the portion of Piperacillin Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times (1/F_1) \times F_2 \times 100$$

r_U = peak response of piperacillin penicilloic acid or acetylated penicilloic acid of piperacillin from the *Sample solution*

r_S = peak response of piperacillin from *Standard solution 2*

C_S = concentration of USP Piperacillin RS in *Standard solution 2* (mg/mL)

C_U = concentration of the *Sample solution* (mg/mL)

P = potency of piperacillin in USP Piperacillin RS (μg/mg)

F_1 = relative response factor (see *Table 1*)

F_2 = conversion factor, 0.001 mg/μg

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Piperacillin related compound E ^{a,b}	0.24	—	—
Ampicillin	0.31	—	—
Acetylated penicilloic acid of piperacillin ^c	0.37	1.1	1.0
Piperacillin penicilloic acid ^d	0.62	0.7	3.5
Piperacillin	1.0	—	—

^a This impurity is not to be reported.

^b 1-Ethyl-2,3-piperazinedione.

^c (2*R*,4*S*)-3-Acetyl-2-[(1*R*)-carboxy[2-(4-ethyl-2,3-dioxopiperazine-1-carboxamido)-2-phenylacetamido]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid.

^d (2*R*,4*S*)-2-[(1*R*)-Carboxy[2-(4-ethyl-2,3-dioxopiperazine-1-carboxamido)-2-phenylacetamido]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid.

SPECIFIC TESTS• **pH (791)**

Sample solution: 400 mg/mL

Acceptance criteria: 5.5–7.5

• **WATER DETERMINATION, Method I (921)**

Test preparation: Proceed as described for hygroscopic substances.

Acceptance criteria: NMT 1.0%

• **BACTERIAL ENDOTOXINS TEST (85):** Where the label states that Piperacillin Sodium is sterile or that it must be subjected to further processing during the preparation of injectable dosage forms, it contains NMT 0.07 USP Endotoxin Unit/mg of piperacillin.

- **STERILITY TESTS** (71): Where the label states that Piperacillin Sodium is sterile or that it must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements when tested as directed in *Test for Sterility of the Product to Be Examined, Membrane Filtration*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.
- **USP REFERENCE STANDARDS** (11)
 - USP Ampicillin RS
 - USP Endotoxin RS
 - USP Piperacillin RS

Piperacillin for Injection

DEFINITION

Piperacillin for Injection contains an amount of Piperacillin Sodium equivalent to NLT 90.0% and NMT 120.0% of the labeled amount of piperacillin ($C_{23}H_{27}N_5O_7S$).

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)

Sample: Dissolve 250 mg in water. Add 0.5 mL of 2 N hydrochloric acid and 5 mL of ethyl acetate. Stir, and allow to stand for 10 min in ice water. Pass through a suitable sintered-glass filter, applying suction. Wash the crystals with 5 mL of water and 5 mL of ethyl acetate, then dry in an oven at 60° for 60 min.

Acceptance criteria: Meets the requirements

ASSAY

- **PROCEDURE**

Mobile phase: Methanol, 0.2 M monobasic sodium phosphate, 0.4 M tetrabutylammonium hydroxide, and water (450:100:3:447). Adjust with phosphoric acid to a pH of 5.50.

System suitability solution: 0.1 mg/mL of USP Ampicillin RS and 0.2 mg/mL of USP Piperacillin RS in *Mobile phase*

Standard solution: 0.4 mg/mL of USP Piperacillin RS in *Mobile phase*. Dissolve in a few drops of methanol, and dilute with *Mobile phase* to volume. Use this solution within 1 h.

Sample solution 1 (where it is labeled for use as a single-dose container): Equivalent to 0.4 mg/mL of piperacillin from Piperacillin for Injection constituted as directed below.

Constitute Piperacillin for Injection in a volume of water corresponding to the volume of solvent specified in the labeling. Withdraw all of the withdrawable contents using a suitable hypodermic needle and syringe, and dilute with *Mobile phase*.

Sample solution 2 (where the label states the quantity of piperacillin in a given volume of the constituted solution): Equivalent to 0.4 mg/mL of piperacillin from Piperacillin for Injection constituted as directed below. Constitute Piperacillin for Injection in a volume of water corresponding to the volume of solvent specified in the labeling. Dilute an aliquot of the constituted solution with *Mobile phase*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 1 mL/min

Injection volume: 10 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—See *Table 1* for the relative retention times.]

Suitability requirements

Resolution: NLT 16 between ampicillin and piperacillin, *System suitability solution*

Tailing factor: NMT 1.2 for the piperacillin peak, *System suitability solution*

Relative standard deviation: NMT 2%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution 1* or *Sample solution 2*

Calculate the percentage of the labeled amount of piperacillin ($C_{23}H_{27}N_5O_7S$) in the container or in the portion of constituted solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Piperacillin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of piperacillin in *Sample solution 1* or *Sample solution 2* (mg/mL)

P = potency of piperacillin in USP Piperacillin RS (μg/mg)

F = conversion factor, 0.001 mg/μg

Acceptance criteria: 90.0%–120.0%

PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS** (905): Meets the requirements

IMPURITIES

- **ORGANIC IMPURITIES**

Mobile phase, System suitability solution, Sample solution 1, Sample solution 2, Chromatographic system, and System suitability: Proceed as directed in the Assay. Evaluate the *Relative standard deviation* using the *Standard solution* prepared in the Assay.

Standard solution: 40 μg/mL of USP Piperacillin RS in *Mobile phase*. Dissolve in a few drops of methanol, and dilute with *Mobile phase* to volume. Use this solution within 1 h.

Analysis

Samples: *Sample solution 1* or *Sample solution 2* and *Standard solution*

Calculate the percentage of piperacillin penicilloic acid and acetylated penicilloic acid of piperacillin in the portion of Piperacillin for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times (1/F_1) \times F_2 \times 100$$

r_U = peak response of piperacillin penicilloic acid or acetylated penicilloic acid of piperacillin from *Sample solution 1* or *Sample solution 2*

r_S = peak response of piperacillin from the *Standard solution*

C_S = concentration of USP Piperacillin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of piperacillin in *Sample solution 1* or *Sample solution 2* (mg/mL)

P = potency of piperacillin in USP Piperacillin RS (μg/mg)

F_1 = relative response factor (see *Table 1*)

F_2 = conversion factor, 0.001 mg/μg

Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Piperacillin related compound E ^{a,b}	0.24	—	—
Ampicillin ^a	0.31	—	—
Acetylated penicillic acid of piperacillin ^c	0.37	1.1	1.0
Piperacillin penicillic acid ^d	0.62	0.7	3.5
Piperacillin	1.0	—	—

^a These are process impurities that are listed here for information only; they are controlled in the drug substance and are not to be reported.

^b 1-Ethyl-2,3-piperazinedione.

^c (2*R*,4*S*)-3-Acetyl-2-[(1*R*)-carboxy[2-(4-ethyl-2,3-dioxopiperazine-1-carboxamido)-2-phenylacetamido]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid.

^d (2*R*,4*S*)-2-[(1*R*)-Carboxy[2-(4-ethyl-2,3-dioxopiperazine-1-carboxamido)-2-phenylacetamido]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid.

SPECIFIC TESTS

- **CONSTITUTED SOLUTION:** At the time of use, it meets the requirements in *Injections and Implanted Drug Products* (1), *Specific Tests*, *Completeness and clarity of solutions*.
- **BACTERIAL ENDOTOXINS TEST (85):** It contains NMT 0.07 USP Endotoxin Unit/mg of piperacillin.
- **STERILITY TESTS (71):** It meets the requirements when tested as directed in *Test for Sterility of the Product to Be Examined*, *Membrane Filtration*.
- **pH (791):** 4.8–6.8, in a solution of 200 mg/mL of piperacillin
- **WATER DETERMINATION, Method I (921):** NMT 0.9%
- **PARTICULATE MATTER IN INJECTIONS (788):** Meets the requirements for small-volume injections
- **OTHER REQUIREMENTS:** It meets the requirements in *Labeling* (7), *Labels and Labeling for Injectable Products*.

ADDITIONAL REQUIREMENTS

Change to read:

- **PACKAGING AND STORAGE:** Preserve as described in *Packaging and Storage Requirements* (659), *Injection Packaging, Packaging for constitution* (CN 1-May-2017).

USP Ampicillin RS
USP Endotoxin RS
USP Piperacillin RS

Piperacillin and Tazobactam for Injection

DEFINITION

Piperacillin and Tazobactam for Injection contains amounts of Piperacillin Sodium and Tazobactam Sodium equivalent to NLT 90.0% and NMT 110.0% of the labeled amounts of piperacillin (C₂₃H₂₇N₅O₇S) and tazobactam (C₁₀H₁₂N₄O₅S), the labeled amounts representing proportions of piperacillin to tazobactam of 8:1. It may contain small amounts of a suitable buffer and stabilizer.

IDENTIFICATION

- **A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the Assay.

ASSAY

PROCEDURE

Buffer: 27.6 g/L of monobasic sodium phosphate

Solution A: 80 mL of 40% aqueous tetrabutylammonium hydroxide diluted with water to 100 mL

Mobile phase: Methanol, water, *Buffer*, and *Solution A* (510:432:50:8). Adjust with phosphoric acid to a pH of 5.5.

Standard solution: 0.1 mg/mL of USP Tazobactam RS and 1 mg/mL of USP Piperacillin RS in *Mobile phase*. Refrigerate the *Standard solution* immediately after preparation and during analysis, using a refrigerated autosampler set at 5 ± 3°. Analyze within 24 h of preparation.

Sample solution: Nominally 0.125 mg/mL of tazobactam and 1 mg/mL of piperacillin from Piperacillin and Tazobactam for Injection in *Mobile phase*. Refrigerate the *Sample solution* immediately after preparation and during analysis, using a refrigerated autosampler set at 5 ± 3°. Analyze within 24 h of preparation.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 1 mL/min

Injection volume: 10 μL

Autosampler temperature: 5 ± 3°

System suitability

[NOTE—The relative retention times for tazobactam and piperacillin are 0.36 and 1.0, respectively.]

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0 for tazobactam and piperacillin

Relative standard deviation: NMT 2.0% for tazobactam and piperacillin

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of piperacillin (C₂₃H₂₇N₅O₇S) in the portion of Piperacillin and Tazobactam for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

r_U = peak response of piperacillin from the *Sample solution*

r_S = peak response of piperacillin from the *Standard solution*

C_S = concentration of USP Piperacillin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of piperacillin in the *Sample solution* (mg/mL)

P = potency of piperacillin in USP Piperacillin RS (μg/mg)

F = conversion factor, 0.001 mg/μg

Calculate the percentage of the labeled amount of tazobactam (C₁₀H₁₂N₄O₅S) in the portion of Piperacillin and Tazobactam for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times 100$$

r_U = peak response of tazobactam from the *Sample solution*

r_S = peak response of tazobactam from the *Standard solution*

C_S = concentration of USP Tazobactam RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of tazobactam in the *Sample solution* (mg/mL)

P = potency of tazobactam in USP Tazobactam RS (mg/mg)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS (905):** Meets the requirements

IMPURITIES

• ORGANIC IMPURITIES, PROCEDURE 1

Organic Impurities, Procedure 1 is recommended when the impurity profile includes piperacillin impurities 4, 5, and 6.

Buffer: Dilute the contents of one vial of tetrabutylammonium hydrogen sulfate ion pairing reagent with water to 1 L.

Solution A: Phosphoric acid and water (1:4)

Mobile phase: Acetonitrile and *Buffer* (25:75). Adjust with *Solution A* to a pH of 3.8.

Diluent: Acetonitrile and water (25:75)

Standard stock solution 1: 60 µg/mL of USP Tazobactam Related Compound A RS in *Diluent*

Standard stock solution 2: 0.5 mg/mL of USP Tazobactam RS in *Diluent*

Standard stock solution 3: 1.0 mg/mL of USP Piperacillin RS in acetonitrile and *Diluent* (1:24). Dissolve first in acetonitrile, using about 4% of the final volume, and dilute with *Diluent* to volume.

System suitability solution: 6 µg/mL of tazobactam related compound A from *Standard stock solution 1* and 25 µg/mL of tazobactam from *Standard stock solution 2* in *Diluent*

Standard solution: 25 µg/mL of tazobactam from *Standard stock solution 2* and 0.2 mg/mL of piperacillin from *Standard stock solution 3* in *Mobile phase*. Refrigerate the solution immediately after preparation and during analysis, using a refrigerated autosampler set at 5 ± 3°. Analyze within 24 h of preparation.

Sample solution: Nominally 25 µg/mL of tazobactam and 0.2 mg/mL of piperacillin from Piperacillin and Tazobactam for Injection in *Mobile phase*. Refrigerate the solution immediately after preparation and during analysis, using a refrigerated autosampler set at 5 ± 3°. Analyze within 24 h of preparation.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 15-cm; 3-µm packing L11

Flow rate: 1 mL/min

Injection volume: 20 µL

Autosampler temperature: 5 ± 3°

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 3 between tazobactam related compound A and tazobactam, *System suitability solution*

Tailing factor: NMT 1.8 for tazobactam and piperacillin, *Standard solution*

Relative standard deviation: NMT 2% for tazobactam and piperacillin, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Piperacillin and Tazobactam for Injection taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times P \times (F_1/F_2) \times 100$$

r_u = peak response of each impurity from the *Sample solution*

r_s = peak response of piperacillin from the *Standard solution*

C_s = concentration of USP Piperacillin RS in the *Standard solution* (mg/mL)

C_u = nominal concentration of piperacillin in the *Sample solution* (mg/mL)

P = potency of USP Piperacillin RS (µg/mg)

F_1 = correction factor, 0.001 mg/µg

F_2 = relative response factor (see *Table 1*)

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Relative Response Factor ^a	Acceptance Criteria, NMT (%) ^a
Tazobactam related compound A ^b	0.12	0.75	1.0
Tazobactam	0.25	—	—

^c Specified unidentified impurities.

^d This compound has two epimers that usually co-elute but that may be separated as a result of minor changes in the chromatographic conditions.

^e (4S)-2-[[2-(4-Ethyl-2,3-dioxopiperazine-1-carboxamido)-2-phenylacetamido]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid.

^f (2R,4S)-2-[(1R)-Carboxy[2-(4-ethyl-2,3-dioxopiperazine-1-carboxamido)-2-phenylacetamido]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid.

^g (2R,4S)-3-Acetyl-2-[(1R)-carboxy[2-(4-ethyl-2,3-dioxopiperazine-1-carboxamido)-2-phenylacetamido]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid.

^h Total impurities does not include piperacillin penicilloic acid.

• ORGANIC IMPURITIES, PROCEDURE 2

Organic Impurities, Procedure 2 is recommended when the impurity profile includes piperacillin dimer ethyl ester and piperacillin dimer thiazolamide derivative.

Solution A: 3.12 g/L of monobasic sodium phosphate. Adjust with phosphoric acid to a pH of 3.5.

Solution B: Methanol

Mobile phase: See *Table 2*.

Table 2

Time (min)	Solution A (%)	Solution B (%)
0	90	10
5	85	15
10	65	35
35	55	45
60	35	65
65	90	10
75	90	10

System suitability solution 1: 10 µg/mL of USP Amoxicillin Related Compound A RS and 6 µg/mL of USP Tazobactam Related Compound A RS in *Solution A*. Refrigerate *System suitability solution 1* immediately after preparation and during analysis, using a refrigerated autosampler set at 5 ± 3°. Analyze within 24 h of preparation.

System suitability solution 2: 0.2 mg/mL each of USP Piperacillin RS and USP Tazobactam RS in a mixture of methanol and *Solution A* (30:70). Prepare the solution by dissolving the compounds in methanol and diluting with *Solution A* to volume. Refrigerate *System suitability solution 2* immediately after preparation and during analysis, using a refrigerated autosampler set at $5 \pm 3^\circ$. Analyze within 24 h of preparation.

Sample solution: Nominally 2 mg/mL of piperacillin and 0.25 mg/mL of tazobactam from Piperacillin and Tazobactam for Injection in *Solution A*. Refrigerate the *Sample solution* immediately after preparation and during analysis, using a refrigerated autosampler set at $5 \pm 3^\circ$. Analyze within 24 h of preparation.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Temperatures

Column: 30°

Autosampler: $5 \pm 3^\circ$

Flow rate: 1 mL/min

Injection volume: 20 μ L

System suitability

Samples: *System suitability solution 1* and *System suitability solution 2*

Suitability requirements

Resolution: NLT 1.5 between tazobactam related compound A and amoxicillin related compound A, *System suitability solution 1*

Tailing factor: NMT 2.0 for the piperacillin and tazobactam peaks, *System suitability solution 2*

Relative standard deviation: NMT 10.0% for the piperacillin and tazobactam peaks, *System suitability solution 2*

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Piperacillin and Tazobactam for Injection taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_T = sum of the responses of all peaks from the *Sample solution*

Acceptance criteria: See *Table 3*.

• ORGANIC IMPURITIES, PROCEDURE 3

Organic Impurities, Procedure 3 is recommended when the impurity profile includes piperacillinpenicillenic acid and piperazinedione carbonyl D-phenylglycylglycine.

Buffer: 27.6 g/L of monobasic sodium phosphate dihydrate

Solution A: 0.4 M aqueous tetrabutylammonium hydroxide

Solution B: Methanol, *Solution A*, *Buffer*, and water (275:3:100:622). Adjust with phosphoric acid to a pH of 5.5.

Solution C: Methanol, *Solution A*, *Buffer*, and water (615:3:100:282). Adjust with phosphoric acid to a pH of 5.5.

Mobile phase: See *Table 4*.

Table 4

Time (min)	Solution B (%)	Solution C (%)
0	100	0
6	100	0

Table 4 (Continued)

Time (min)	Solution B (%)	Solution C (%)
55	71	29
73	10	90
85	10	90

System suitability solution: 60 µg/mL of USP Piperacillin Related Compound E RS, 0.1 mg/mL of USP Tazobactam Related Compound A RS, and 0.76 mg/mL of USP Tazobactam RS in *Solution C*

Standard solution 1: 6 mg/mL of USP Piperacillin RS in *Solution C*

Standard solution 2: 0.06 mg/mL of USP Piperacillin RS in *Solution C*

Sample solution: Nominally 5.1 mg/mL of piperacillin and 0.64 mg/mL of tazobactam from Piperacillin and Tazobactam for Injection in water. Refrigerate the *Sample solution* immediately after preparation and during analysis, using a refrigerated autosampler set at 4°. Analyze within 10 h of preparation.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Temperatures

Column: 40°

Autosampler: 4°

Flow rate: 1 mL/min

Injection volume: 10 µL

System suitability

Samples: *System suitability solution* and *Standard solution 2*

Suitability requirements

Resolution: NLT 1.5 between tazobactam related compound A and piperacillin related compound E, *System suitability solution*

Tailing factor: NMT 2.0 for piperacillin, *Standard solution 2*

Relative standard deviation: NMT 10.0% for the tazobactam peak, *System suitability solution*

Analysis

Samples: *Standard solution 2* and *Sample solution*

Calculate the percentage of each impurity in the portion of Piperacillin and Tazobactam for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times (F_1/F_2) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of piperacillin from *Standard solution 2*

C_S = concentration of USP Piperacillin RS in *Standard solution 2* (mg/mL)

C_U = nominal concentration of the *Sample solution* (mg/mL)

P = potency of piperacillin in USP Piperacillin RS (µg/mg)

F_1 = correction factor, 0.001 mg/µg

F_2 = relative response factor (see *Table 5*)

Acceptance criteria: See *Table 5*. Disregard peaks that are 0.05 times the response of the peak in *Standard solution 2*. Disregard peaks that elute after piperacillinylampicillin.

Table 5

50	100	0
60	100	0

System suitability solution: 10 µg/mL of USP Amoxicillin Related Compound A RS and 6 µg/mL of USP Tazobactam Related Compound A RS in *Buffer***Standard stock solution:** 1 mg/mL of USP Piperacillin RS and 36 µg/mL of USP Tazobactam RS, prepared as follows. Dissolve suitable amounts of USP Piperacillin RS and USP Tazobactam RS in a small amount of acetonitrile. Dilute with *Buffer* to volume.**Standard solution:** 50 µg/mL of piperacillin and 1.8 µg/mL of tazobactam from *Standard stock solution* in *Buffer***Sample solution:** Nominally 5 mg/mL of piperacillin and 0.625 mg/mL of tazobactam from Piperacillin and Tazobactam for Injection in *Buffer*. Store the *Sample solution* at 2°–8°, and use within 1 h.**Chromatographic system**(See *Chromatography* (621), *System Suitability*.)**Mode:** LC**Detector:** UV 220 nm**Column:** 4.6-mm × 25-cm; 5-µm packing L1**Temperatures****Column:** 30°**Autosampler:** 2°–8°**Flow rate:** 1.5 mL/min**Injection volume:** 20 µL**System suitability****Samples:** *System suitability solution* and *Standard solution***Suitability requirements****Resolution:** NLT 1.5 between tazobactam related compound A and amoxicillin related compound A, *System suitability solution***Tailing factor:** NMT 2.0 for the piperacillin and tazobactam peaks, *Standard solution***Relative standard deviation:** NMT 5.0% for the piperacillin and tazobactam peaks, *Standard solution***Analysis****Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity other than tazobactam related compound A in the portion of Piperacillin and Tazobactam for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

 r_U = peak response of each impurity other than tazobactam related compound A from the *Sample solution* r_S = peak response of piperacillin from the *Standard solution* C_S = concentration of USP Piperacillin RS in the *Standard solution* (mg/mL) C_U = nominal concentration of piperacillin in the *Sample solution* (mg/mL) P = potency of piperacillin in USP Piperacillin RS (µg/mg) F = conversion factor, 0.001 mg/µg

Calculate the percentage of tazobactam related compound A in the portion of Piperacillin and Tazobactam for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times 100$$

 r_U = peak response of tazobactam related compound A from the *Sample solution* r_S = peak response of tazobactam from the *Standard solution*

- C_s = concentration of USP Tazobactam RS in the Standard solution (mg/mL)
 C_u = nominal concentration of tazobactam in the Sample solution (mg/mL)
 P = potency of tazobactam in USP Tazobactam RS (mg/mg)

Acceptance criteria: See Table 7.

SPECIFIC TESTS

- **BACTERIAL ENDOTOXINS TEST (85):** It contains NMT 0.08 USP Endotoxin Units in a portion equivalent to 1 mg of a mixture of piperacillin and tazobactam (0.89 and 0.11 mg, respectively).
- **STERILITY TESTS (71):** Meets the requirements
- **PARTICULATE MATTER IN INJECTIONS (788):** Meets the requirements
- **PH (791)**
Sample solution: Nominally 40 mg/mL of piperacillin
Acceptance criteria: 5.0–7.0
- **WATER DETERMINATION (921), Method I:** NMT 2.5%
- **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products (1)*.

ADDITIONAL REQUIREMENTS

Change to read:

- **PACKAGING AND STORAGE:** Preserve as described in *Packaging and Storage Requirements (659)*, *Injection Packaging, Packaging for constitution* (CN 1-May-2017). Store at controlled room temperature.
- **LABELING:** Label it to indicate its sodium content. If a test for *Organic Impurities* other than *Procedure 1* is used, then the labeling states with which *Organic Impurities* test the article complies.
- **USP REFERENCE STANDARDS (11)**
USP Amoxicillin Related Compound A RS

USP Endotoxin RS
USP Piperacillin RS
USP Piperacillin Related Compound E RS

1-Ethylpiperazine-2,3-dione.

$C_6H_{10}N_2O_2$ 142.16

USP Tazobactam RS

USP Tazobactam Related Compound A RS

(2S,3S)-2-Amino-3-methyl-3-sulfinyl-4-(1H-1,2,3-triazol-1-yl)butyric acid.

$C_7H_{12}N_4O_4S$ 248.26

Piperazine

$C_4H_{10}N_2$ 86.14

Piperazine.

Piperazine [110-85-0].

» Piperazine contains not less than 98.0 percent and not more than 101.0 percent of $C_4H_{10}N_2$, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight containers, protected from light.

USP Reference standards (11)—

USP Piperazine RS

Color of solution—Dissolve 10.0 g in water, and dilute with water to 50.0 mL: the solution has no more color than a standard solution prepared by adding 2.0 mL of ferric chloride CS to water and diluting with water to 50.0 mL, when compared in matched color-comparison tubes.

Identification—

A: Infrared Absorption (197M).

B: In the test for *Chromatographic purity*, the principal spot in the chromatogram of *Test solution 2*, observed after spraying with the ninhydrin solutions, corresponds in R_f value, color, and size to that in the chromatogram of *Standard solution 1*.

Melting range (741): between 109° and 113°.

Water Determination, Method I (921): not more than 2.0%.

Chromatographic purity—

Solvent—Prepare a mixture of 13.5 N ammonium hydroxide and dehydrated alcohol (3:2).

Standard solution 1—Prepare a solution of USP Piperazine RS in *Solvent* containing 10 mg per mL.

Standard solution 2—Prepare a solution of ethylenediamine in *Solvent* containing 0.25 mg per mL.

Standard solution 3—Prepare a solution of triethylenediamine in *Solvent* containing 0.25 mg per mL.

Resolution solution—Prepare a solution in *Solvent* containing 0.25 mg of triethylenediamine and 10 mg of USP Piperazine RS per mL.

Test solution 1—Prepare a solution of Piperazine in *Solvent* containing 100 mg per mL.

Test solution 2—Mix 1 mL of *Test solution 1* and 9 mL of *Solvent*.

Procedure—Apply separate 5-μL portions of *Standard solution 1*, *Standard solution 2*, *Standard solution 3*, *Resolution solution*, *Test solution 1*, and *Test solution 2* to a suitable thin-layer chromatographic plate (see *Chromatography* (621)), coated with a 0.25-mm layer of chromatographic silica gel. Allow the spots to dry, and develop the chromatograms in a

solvent system consisting of a freshly prepared mixture of acetone and 13.5 N ammonium hydroxide (80:20) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and dry the plate at 105°. Spray the plate with a 0.3% (w/v) solution of ninhydrin in a mixture of butyl alcohol and glacial acetic acid (100:3). Spray the plate again with a 0.15% (w/v) solution of ninhydrin in dehydrated alcohol, dry the plate at 105° for 10 minutes, and examine the plate: any secondary spot in the chromatogram obtained from *Test solution 1* is not more intense than the principal spot in the chromatogram obtained from *Standard solution 2* (0.25%). Spray the plate with 0.1 N iodine TS, allow to stand for 10 minutes, and examine the plate: any spot corresponding to triethylenediamine in the chromatogram obtained from *Test solution 1* is not more intense than the principal spot in the chromatogram obtained from *Standard solution 3* (0.25%). In a valid test, the chromatogram obtained from the *Resolution solution* shows a spot due to triethylenediamine clearly separated from the principal spot. Disregard any spot at the origin of any chromatogram.

Assay—Weigh accurately about 150 mg of Piperazine, and dissolve in 75 mL of glacial acetic acid. Titrate potentiometrically with 0.1 N perchloric acid VS, using a silver-glass electrode system. As the endpoint is approached, warm the solution to 60° to 70°, then complete the titration. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 4.307 mg of $C_4H_{10}N_2$.

Piperazine Adipate

$C_4H_{10}N_2 \cdot C_6H_{10}O_4$ 232.28

Piperazine, compound with 1,4-butanediacycarboxylic acid (1:1).

Piperazine, compound with hexanedioic acid (1:1) [142-88-1].

» Piperazine Adipate contains not less than 98.0 percent and not more than 101.0 percent of $C_4H_{10}N_2 \cdot C_6H_{10}O_4$, calculated on the anhydrous basis.

Packaging and storage—Preserve in well-closed containers, and store at room temperature.

Labeling—Label it to indicate that it is for veterinary use only.

USP Reference standards (11)—

USP Piperazine Adipate RS

Identification—

A: Infrared Absorption (197K).

B: In the test for *Chromatographic purity*, the principal spot in the chromatogram obtained from *Test solution 2* observed after spraying with the ninhydrin solutions corresponds in R_f value, color, and size to that in the chromatogram obtained from *Standard solution 1*.

C: To 10 mL of a 1 in 20 solution of it add 5 mL of hydrochloric acid, and extract with three 10-mL portions of ether. Evaporate the combined ether extracts to dryness, wash the residue with water, and dry at 105°: the residue of adipic acid so obtained melts at between 150° and 154°.

Water Determination, Method I (921): not more than 0.5%.

Residue on ignition (281): not more than 0.1%.

Chromatographic purity—

Solvent—Prepare a mixture of 13.5 N ammonium hydroxide and dehydrated alcohol (3:2).

Test solution 1—Prepare a solution of Piperazine Adipate in *Solvent* containing 100 mg per mL.

Test solution 2—Mix 1 mL of *Test solution 1* and 9 mL of *Solvent*.

Standard solution 1—Prepare a solution of USP Piperazine Adipate RS in *Solvent* containing 10 mg per mL.

Standard solution 2—Prepare a solution of ethylenediamine in *Solvent* containing 0.25 mg per mL.

Standard solution 3—Prepare a solution of triethylenediamine in *Solvent* containing 0.25 mg per mL.

Resolution solution—Prepare a solution in *Solvent* containing 0.25 mg of triethylenediamine and 10 mg of Piperazine Adipate per mL.

Procedure—Separately apply 5-μL portions of *Test solution 1*, *Test solution 2*, *Standard solution 1*, *Standard solution 2*, *Standard solution 3*, and the *Resolution solution* to a suitable thin-layer chromatographic plate (see *Chromatography* (621)), coated with a 0.25-mm layer of chromatographic silica gel. Allow the spots to dry, and develop the chromatograms in a solvent system consisting of a freshly prepared mixture of acetone and 13.5 N ammonium hydroxide (80:20) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and dry the plate at 105°. Spray the plate with a 0.3% solution of ninhydrin in a mixture of butyl alcohol and glacial acetic acid (100:3). Spray the plate again with a 0.15% solution of ninhydrin in dehydrated alcohol, dry the plate at 105° for 10 minutes, and examine the plate: any secondary spot in the chromatogram obtained from *Test solution 1* is not more intense than the principal spot in the chromatogram obtained from *Standard solution 2* (0.25%). Spray the plate with 0.1 N iodine TS, allow to stand for 10 minutes, and examine the plate: any spot corresponding to triethylenediamine in the chromatogram obtained from *Test solution 1* is not more intense than the principal spot in the chromatogram obtained from *Standard solution 3* (0.25%). In a valid test, the chromatogram obtained from the *Resolution solution* shows a spot due to triethylenediamine clearly separated from the principal spot. Disregard any spot at the origin of any chromatogram.

Assay—Dissolve about 100 mg of Piperazine Adipate, accurately weighed, in 10 mL of glacial acetic acid, heating gently if necessary. Add 60 mL of glacial acetic acid and 0.25 mL of *p*-naphtholbenzein TS, and titrate with 0.1 N perchloric acid until the brownish-yellow color of the solution turns green. Each mL of 0.1 N perchloric acid is equivalent to 11.61 mg of $C_4H_{10}N_2 \cdot C_6H_8O_7$.

$(C_4H_{10}N_2)_3 \cdot 2C_6H_8O_7$, calculated on the anhydrous basis.

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Piperazine Citrate RS

Identification—

A: Infrared Absorption (197K).

B: In the test for *Chromatographic purity*, the principal spot in the chromatogram of *Test solution 2*, observed after spraying with the ninhydrin solutions, corresponds in R_f value, color, and size to that in the chromatogram of *Standard solution 1*.

C: It responds to the tests for *Citrate* (191).

Water Determination, Method I (921): not more than 12.0%.

Chromatographic purity—

Solvent—Prepare a mixture of 13.5 N ammonium hydroxide and dehydrated alcohol (3:2).

Standard solution 1—Prepare a solution of USP Piperazine Citrate RS in *Solvent* containing 10 mg per mL.

Standard solution 2—Prepare a solution of ethylenediamine in *Solvent* containing 0.25 mg per mL.

Standard solution 3—Prepare a solution of triethylenediamine in *Solvent* containing 0.25 mg per mL.

Test solution 1—Prepare a solution of Piperazine Citrate in *Solvent* containing 100 mg per mL.

Test solution 2—Mix 1 mL of *Test solution 1* and 9 mL of *Solvent*.

Resolution solution—Prepare a solution in *Solvent* containing 0.25 mg of triethylenediamine and 10 mg of Piperazine Citrate per mL.

Procedure—Apply separate 5-μL portions of *Standard solution 1*, *Standard solution 2*, *Standard solution 3*, *Resolution solution*, *Test solution 1*, and *Test solution 2* to a suitable thin-layer chromatographic plate (see *Chromatography* (621)), coated with a 0.25-mm layer of chromatographic silica gel. Allow the spots to dry, and develop the chromatograms in a solvent system consisting of a freshly prepared mixture of acetone and 13.5 N ammonium hydroxide (80:20) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and dry the plate at 105°. Spray the plate with a 0.3% (w/v) solution of ninhydrin in a mixture of butyl alcohol and glacial acetic acid (100:3). Spray the plate again with a 0.15% (w/v) solution of ninhydrin in dehydrated alcohol, dry the plate at 105° for 10 minutes, and examine the plate: any secondary spot in the chromatogram obtained from *Test solution 1* is not more intense than the principal spot in the chromatogram obtained from *Standard solution 2* (0.25%). Spray the plate with 0.1 N iodine TS, allow to stand for 10 minutes, and examine the plate: any spot corresponding to triethylenediamine in the chromatogram obtained from *Test solution 1* is not more intense than the principal spot in the chromatogram obtained from *Standard solution 3* (0.25%). In a valid test, the chromatogram obtained from the *Resolution solution* shows a spot due to triethylenediamine clearly separated from the principal spot. Disregard any spot at the origin of any chromatogram.

Assay—Dissolve about 200 mg of Piperazine Citrate, accurately weighed, in 100 mL of glacial acetic acid, warming slightly if necessary to effect solution. Add crystal violet TS, and titrate with 0.1 N perchloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 10.71 mg of $(C_4H_{10}N_2)_3 \cdot 2C_6H_8O_7$.

Piperazine Citrate

$(C_4H_{10}N_2)_3 \cdot 2C_6H_8O_7 \cdot xH_2O$ (anhydrous) 642.65
Piperazine, 2-hydroxy-1,2,3-propanetricarboxylate (3:2),
hydrate.

Piperazine citrate (3:2) hydrate [41372-10-5].
Anhydrous 642.66 [144-29-6].

» Piperazine Citrate contains not less than 98.0 percent and not more than 100.5 percent of

Piperazine Citrate Syrup

» Piperazine Citrate Syrup is prepared from Piperazine Citrate or from Piperazine to which an equivalent amount of Citric Acid is added. It contains an amount of piperazine citrate equivalent to not less than 93.0 percent and not more than 107.0 percent of the labeled amount of piperazine hexahydrate ($C_4H_{10}N_2 \cdot 6H_2O$).

Packaging and storage—Preserve in tight containers.

Identification—

A: To 2 mL of Syrup add 5 mL of 3 N hydrochloric acid, then add, with stirring, 1 mL of sodium nitrite solution (1 in 2). Chill in an ice bath for 15 minutes, stirring if necessary, to induce crystallization, filter the precipitate on a sintered-glass funnel, wash with 10 mL of cold water, and dry at 105°: the *N,N'*-dinitrosopiperazine so obtained melts between 156° and 160°.

B: It responds to the tests for *Citrate* (191).

Assay—Determine the specific gravity of Syrup, and transfer an accurately weighed portion of the Syrup, equivalent to about 200 mg of piperazine citrate, to a 250-mL beaker. Add 10 mL of water and 75 mL of trinitrophenol TS, stir well, and allow to stand in a refrigerator for not less than 2 hours. Collect the precipitate in a tared filtering crucible, wash with five 10-mL portions of dehydrated alcohol, and dry at 105° to constant weight. [Caution—Picrates may explode.] The weight of the dipicrate, multiplied by 0.3568, gives the equivalent of $C_4H_{10}N_2 \cdot 6H_2O$ in the portion of Syrup taken.

Piperazine Citrate Tablets

» Piperazine Citrate Tablets contain an amount of piperazine citrate equivalent to not less than 93.0 percent and not more than 107.0 percent of the labeled amount of piperazine hexahydrate ($C_4H_{10}N_2 \cdot 6H_2O$).

Packaging and storage—Preserve in tight containers.

Identification—

A: Finely powder a number of Tablets, equivalent to about 200 mg of piperazine citrate, mix with 5 mL of 3 N hydrochloric acid, and filter. To the filtrate add, with stirring, 1 mL of sodium nitrite solution (1 in 2). Chill in an ice bath for 15 minutes, stirring if necessary, to induce crystallization, filter the precipitate on a sintered-glass funnel, wash with 10 mL of cold water, and dry at 105°: the *N,N'*-dinitrosopiperazine so obtained melts between 156° and 160°.

B: To a quantity of powdered Tablets, equivalent to about 500 mg of piperazine citrate, add 10 mL of water, shake, and filter: the filtrate responds to the tests for *Citrate* (191).

Dissolution, Procedure for a Pooled Sample (711)—

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Time: 45 minutes.

Procedure—Determine the amount of piperazine hexahydrate ($C_4H_{10}N_2 \cdot 6H_2O$) dissolved, employing the procedure set forth in the Assay, making any necessary modifications.

Tolerances—Not less than 75% (Q) of the labeled amount of $C_4H_{10}N_2 \cdot 6H_2O$ is dissolved in 45 minutes.

Uniformity of dosage units (905): meet the requirements.

Assay—Weigh and finely powder not less than 20 Tablets. Shake an accurately weighed portion of the powder, equivalent to about 200 mg of piperazine citrate, for 1 hour with 10 mL of a mixture of 1 part of 3 N hydrochloric acid and 3 parts of water, filter, and wash the residue with two 10-mL portions of water. To the combined extract and washings add 75 mL of trinitrophenol TS, and proceed as directed in the Assay under *Piperazine Citrate Syrup*, beginning with "stir well."

Piperazine Dihydrochloride

$C_4H_{10}N_2 \cdot 2HCl \cdot xH_2O$ 159.06 (anhydrous)
Piperazine dihydrochloride hydrate [142-64-3].

» Piperazine Dihydrochloride contains not less than 98.5 percent and not more than 100.5 percent of $C_4H_{10}N_2 \cdot 2HCl$, calculated on the anhydrous basis.

Packaging and storage—Preserve in well-closed containers, and store at room temperature.

Labeling—Label it to indicate that it is for veterinary use only.

USP Reference standards (11)—

USP Piperazine Dihydrochloride RS.

Identification—

A: Infrared Absorption (197K)—

Test specimen: previously dried at 105° for 3 hours.

B: In the test for *Chromatographic purity*, the principal spot in the chromatogram obtained from *Test solution 2*, observed after spraying with the ninhydrin solutions, corresponds in *R_f* value, color, and size to that in the chromatogram obtained from *Standard solution 1*.

C: It meets the requirements of the test for *Chloride* (191).

pH (791): between 3.0 and 3.4, in a solution (1 in 20).

Water Determination, Method I (921): not more than 10.0%.

Residue on ignition (281): not more than 0.1%.

Chromatographic purity—

Solvent—Prepare a mixture of 13.5 N ammonium hydroxide and dehydrated alcohol (3:2).

Test solution 1—Prepare a solution of Piperazine Dihydrochloride in *Solvent* containing 100 mg per mL.

Test solution 2—Mix 1 mL of *Test solution 1* and 9 mL of *Solvent*.

Standard solution 1—Prepare a solution of USP Piperazine Dihydrochloride RS in *Solvent* containing 10 mg per mL.

Standard solution 2—Prepare a solution of ethylenediamine in *Solvent* containing 0.25 mg per mL.

Standard solution 3—Prepare a solution of triethylenediamine in *Solvent* containing 0.25 mg per mL.

Resolution solution—Prepare a solution in *Solvent* containing 0.25 mg of triethylenediamine and 10 mg of Piperazine Dihydrochloride per mL.

Procedure—Separately apply 5-μL portions of *Test solution 1*, *Test solution 2*, *Standard solution 1*, *Standard solution 2*, *Standard solution 3*, and the *Resolution solution* to a suitable thin-layer chromatographic plate (see *Chromatography* (621)), coated with a 0.25-mm layer of chromatographic

silica gel. Allow the spots to dry, and develop the chromatograms in a solvent system consisting of a freshly prepared mixture of acetone and 13.5 N ammonium hydroxide (80:20) until the solvent front has moved about three-fourths of the length of the plate. Remove the plates from the developing chamber, mark the solvent front, and dry the plate at 105°. Spray the plate with a 0.3% solution of ninhydrin in a mixture of butyl alcohol and glacial acetic acid (100:3). Spray the plate again with a 0.15% solution of ninhydrin in dehydrated alcohol, dry the plate at 105° for 10 minutes, and examine the plate: any secondary spot in the chromatogram obtained from *Test solution 1* is not more intense than the principal spot in the chromatogram obtained from *Standard solution 2* (0.25%). Spray the plate with 0.1 N iodine TS, allow to stand for 10 minutes, and examine the plate: any spot corresponding to triethylenediamine in the chromatogram obtained from *Test solution 1* is not more intense than the principal spot in the chromatogram obtained from *Standard solution 3* (0.25%). In a valid test, the chromatogram obtained from the *Resolution solution* shows a spot due to triethylenediamine clearly separated from the principal spot. Disregard any spot at the origin of any chromatogram.

Assay—Dissolve about 140 mg of Piperazine Dihydrochloride in 4 mL of ethylene glycol using a 150-mL beaker. Add 25 mL of glacial acetic acid containing 1.2 g of mercuric acetate, rinsing the walls of the beaker with a small amount of the glacial acetic acid. Add 0.25 mL of *p*-naphtholbenzene TS, and titrate with 0.1 N perchloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 7.953 mg of $C_4H_{10}N_2 \cdot 2HCl$.

Piperazine Phosphate

$C_4H_{10}N_2 \cdot H_3PO_4 \cdot H_2O$ 202.15
 Piperazine phosphate (1:1), monohydrate.
 Piperazine phosphate (1:1), monohydrate [18534-18-4].
 Anhydrous 184.13 [14538-56-8].

» Piperazine Phosphate contains not less than 98.5 percent and not more than 100.5 percent of $C_4H_{10}N_2 \cdot H_3PO_4$, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight containers, and store at room temperature.

Labeling—Label it to indicate that it is for veterinary use only.

USP Reference standards (11)—
 USP Piperazine Phosphate RS

Identification—

A: Infrared Absorption (197K)—

Test specimen: previously dried at 105° for 3 hours.

B: In the test for *Chromatographic purity*, the principal spot in the chromatogram obtained from *Test solution 2*, observed after spraying with the ninhydrin solutions, corresponds in R_f value, color, and size to that in the chromatogram obtained from *Standard solution 1*.

C: It meets the requirements of the test for *Phosphate* (191).

pH (791): between 6.0 and 6.5, in a solution (1 in 100).

Water, Method I (921): between 8.0% and 9.5%.

Chromatographic purity—

Solvent—Prepare a mixture of 13.5 N ammonium hydroxide and dehydrated alcohol (3:2).

Test solution 1—Prepare a solution of Piperazine Phosphate in *Solvent* containing 100 mg per mL.

Test solution 2—Mix 1 mL of *Test solution 1* and 9 mL of *Solvent*.

Standard solution 1—Prepare a solution of USP Piperazine Phosphate RS in *Solvent* containing 10 mg per mL.

Standard solution 2—Prepare a solution of ethylenediamine in *Solvent* containing 0.25 mg per mL.

Standard solution 3—Prepare a solution of triethylenediamine in *Solvent* containing 0.25 mg per mL.

Resolution solution—Prepare a solution in *Solvent* containing 0.25 mg of triethylenediamine and 10 mg of Piperazine Phosphate per mL.

Procedure—Separately apply 5-μL portions of *Test solution 1*, *Test solution 2*, *Standard solution 1*, *Standard solution 2*, *Standard solution 3*, and the *Resolution solution* to a suitable thin-layer chromatographic plate (see *Chromatography* (621)), coated with a 0.25-mm layer of chromatographic silica gel. Allow the spots to dry, and develop the chromatograms in a solvent system consisting of a freshly prepared mixture of acetone and 13.5 N ammonium hydroxide (80:20) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and dry the plate at 105°. Spray the plate with a 0.3% solution of ninhydrin in a mixture of butyl alcohol and glacial acetic acid (100:3). Spray the plate again with a 0.15% solution of ninhydrin in dehydrated alcohol, dry the plate at 105° for 10 minutes, and examine the plate: any secondary spot in the chromatogram obtained from *Test solution 1* is not more intense than the principal spot in the chromatogram obtained from *Standard solution 2* (0.25%). Spray the plate with 0.1 N iodine TS, allow to stand for 10 minutes, and examine the plate: any spot corresponding to triethylenediamine in the chromatogram obtained from *Test solution 1* is not more intense than the principal spot in the chromatogram obtained from *Standard solution 3* (0.25%). In a valid test, the chromatogram obtained from the *Resolution solution* shows a spot due to triethylenediamine clearly separated from the principal spot. Disregard any spot at the origin of any chromatogram.

Assay—Dissolve about 200 mg of Piperazine Phosphate in 4 mL of ethylene glycol using a 150-mL beaker. Add 25 mL of glacial acetic acid, rinsing the walls of the beaker with a small amount of the glacial acetic acid. Add crystal violet TS, and titrate with 0.1 N perchloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 7.953 mg of $C_4H_{10}N_2 \cdot 2HCl$.

Piroxicam

$C_{15}H_{13}N_3O_4S$ 331.35
 2*H*-1,2-Benzothiazine-3-carboxamide, 4-hydroxy-2-methyl-*N*-2-pyridinyl-, 1,1-dioxide;
 4-Hydroxy-2-methyl-*N*-2-pyridyl-2*H*-1,2-benzothiazine-3-carboxamide 1,1-dioxide [36322-90-4].

DEFINITION

Piroxicam contains NLT 97.0% and NMT 103.0% of piroxicam ($C_{15}H_{13}N_3O_4S$).

IDENTIFICATION

- **A. INFRARED ABSORPTION (197M):** Do not dry specimens.
- **B. ULTRAVIOLET ABSORPTION (197U)**

Solution: 10 µg/mL

Medium: Hydrochloric acid in methanol (1 in 1200)

Acceptance criteria: Meets the requirements

- **C. THIN-LAYER CHROMATOGRAPHY**

Diluent: Chloroform and methanol (1:1)

Standard solution: 1 mg/mL of USP Piroxicam RS in Diluent

Sample solution: 1 mg/mL in Diluent

Chromatographic system

(See Chromatography (621), Thin-Layer Chromatography.)

Absorbent: 0.25-mm layer of chromatographic silica gel

Application volume: 20 µL

Developing solvent system: Toluene and glacial acetic acid (95:5)

Analysis

Samples: Standard solution and Sample solution

Allow the spots to dry, and develop the chromatogram in the Developing solvent system until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, and air-dry. Place the plate in the developing chamber, and develop as before. Remove the plate from the chamber, mark the solvent front, and air-dry. Locate the spots on the plate by viewing under short-wavelength UV light.

Acceptance criteria: The R_f value of the principal spot of the Sample solution corresponds to that of the Standard solution.

ASSAY• **PROCEDURE**

Solution A: Dissolve 7.72 g of anhydrous citric acid in 400 mL of water.

Solution B: Dissolve 5.35 g of dibasic sodium phosphate in 100 mL of water.

Solution C: Add Solution B to Solution A, and dilute with water to 1000 mL.

Mobile phase: Methanol and Solution C (450:550)

Diluent: 0.01 N methanolic hydrochloric acid

Standard stock solution: 0.25 mg/mL of USP Piroxicam RS in Diluent

Standard solution: 0.05 mg/mL of USP Piroxicam RS prepared as follows. Transfer 10.0 mL of Standard stock solution to a 50-mL volumetric flask, add about 25 mL of Diluent and 10.0 mL of water, and dilute with Diluent to volume.

Sample stock solution: 0.5 mg/mL of Piroxicam in Diluent

Sample solution: Transfer 10.0 mL of Sample stock solution to a second 100-mL volumetric flask, add about 50 mL of Diluent and 20.0 mL of water, and dilute with Diluent to volume.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm × 30-cm; packing L1

Flow rate: 1.2 mL/min

Injection volume: 25 µL

System suitability

Sample: Standard solution

Suitability requirements

Column efficiency: NLT 500 theoretical plates

Tailing factor: NMT 1.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of piroxicam ($C_{15}H_{13}N_3O_4S$) in the portion of Piroxicam taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the Sample solution

r_S = peak response from the Standard solution

C_S = concentration of USP Piroxicam RS in the Standard solution (mg/mL)

C_U = concentration of Piroxicam in the Sample solution (mg/mL)

Acceptance criteria: 97.0%–103.0%

Piroxicam Capsules**DEFINITION**

Piroxicam Capsules contain NLT 92.5% and NMT 107.5% of the labeled amount of piroxicam ($C_{15}H_{13}N_3O_4S$).

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHY**

Diluent: Chloroform and methanol (1:1)

Standard solution: 1 mg/mL of USP Piroxicam RS in Diluent

Sample solution: Dissolve a portion of the contents of Capsules in Diluent to obtain a solution containing about 1 mg/mL. Shake by mechanical means for 10 min, and filter a portion. Use the filtrate for the analysis.

Chromatographic system

(See Chromatography (621), Thin-Layer Chromatography.)

Absorbent: 0.25-mm layer of chromatographic silica gel

Application volume: 20 µL

Developing solvent system: Toluene and glacial acetic acid (95:5)

Analysis

Samples: Standard solution and Sample solution

Allow the spots to dry, and develop the chromatogram in the Developing solvent system until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the devel-

oping chamber, and air-dry. Place the plate in the developing chamber, and develop as before. Remove the plate from the chamber, mark the solvent front, and air-dry. Locate the spots on the plate by viewing under short-wavelength UV light.

Acceptance criteria: The R_f value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*.

ASSAY

PROCEDURE

Solution A: Dissolve 7.72 g of anhydrous citric acid in 400 mL of water.

Solution B: Dissolve 5.35 g of dibasic sodium phosphate in 100 mL of water.

Solution C: Add *Solution B* to *Solution A*, and dilute with water to make 1000 mL.

Mobile phase: Methanol and *Solution C* (450:550)

Diluent: 0.01 N methanolic hydrochloric acid

Standard stock solution: 0.25 mg/mL of USP Piroxicam RS in *Diluent*

Standard solution: 0.05 mg/mL of USP Piroxicam RS prepared as follows. Transfer 10.0 mL of *Standard stock solution* to a 50-mL volumetric flask, add 25 mL of *Diluent* and 10.0 mL of water, and dilute with *Diluent* to volume.

Sample stock solution: Transfer, as completely as possible, the contents of NLT 20 Capsules to a suitable tared container, and determine the average weight per capsule. Mix the combined contents, and transfer an amount nominally equivalent to about 50 mg of piroxicam to a 100-mL volumetric flask. Add about 70 mL of *Diluent*, and shake by mechanical means for 30 min. Dilute with *Diluent* to volume, and mix. Centrifuge a portion of this mixture to obtain a clear solution.

Sample solution: Transfer 10.0 mL of the *Sample stock solution* to a 100-mL volumetric flask, add about 50 mL of *Diluent* and 20.0 mL of water, dilute with *Diluent* to volume, and mix.

Piroxicam Compounded Cream

DEFINITION

Piroxicam Compounded Cream contains NLT 90.0% and NMT 110.0% of the labeled amount of piroxicam ($C_{15}H_{13}N_3O_4S$).

Prepare Piroxicam Compounded Cream as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Piroxicam	3 g
White Petrolatum	25 g
Stearyl Alcohol	15 g
Propylparaben	0.06 g
Methylparaben	0.15 g
Propylene Glycol	12.0 g
Sodium Lauryl Sulfate	1 g
Sodium Hydroxide, 1 N	2.5 mL
Purified Water, a sufficient quantity to make	100 g

In an appropriate container (final weight tared), mix the *White Petrolatum* and *Stearyl Alcohol* together, and heat to $80 \pm 5^\circ$ to form a clear oil phase. In a separate container, mix the *Propylparaben*, *Methylparaben*, *Propylene Glycol*, *Sodium Lauryl Sulfate*, and about 30 mL of *Purified Water* together, and heat to $80 \pm 5^\circ$ to form a clear aqueous phase. Add the aqueous phase to the oil phase with continuous stirring, and allow it to cool to 50° to form an emulsion. In a mortar, triturate the *Piroxicam* with the *Sodium Hydroxide* to form a suspension. Using additional *Purified Water* to rinse the mortar, add the piroxicam suspension to the previously prepared emulsion, transferring the suspension stepwise and quantitatively to the emulsion. Add sufficient *Purified Water* with stirring to bring to final weight. Package, and label.

ASSAY**• PROCEDURE**

Solution A: 2.7 g/L of citric acid and 5.4 g/L of dibasic sodium phosphate in *Purified Water*. Pass through a filter of 0.45- μ m pore size.

Mobile phase: Methanol and *Solution A* (50:50). Filter, and degas.

Diluent: 0.01 N methanolic hydrochloric acid prepared by diluting 0.9 mL of hydrochloric acid with methanol to a final volume of 1 L

Standard solution: Dissolve an accurately weighed quantity of USP Piroxicam RS in 2 mL of chloroform, and dilute with *Diluent* to obtain a solution with a nominal concentration of about 50 μ g/mL of piroxicam.

Sample solution: Add 340 mg of Cream to 4 mL of chloroform and 150 mL of *Diluent*. Shake the mixture on a wrist action shaker for 15 min, and dilute with *Diluent* to 200 mL. Pass the solution through a filter of 0.45- μ m pore size, and discard the first 5 mL of the filtrate.

Blank: Add 340 mg of *Purified Water* to 4 mL of chloroform and 150 mL of *Diluent*. Shake the mixture on a wrist action shaker for 15 min, and dilute with *Diluent* to 200 mL. Pass the solution through a filter of 0.45- μ m pore size, and discard the first 5 mL of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Columns

Guard: 4.6-mm \times 2-cm; packing L1

Analytical: 4.6-mm \times 30-cm; 10- μ m packing L1

Flow rate: 1.0 mL/min

Injection volume: 20 μ L

System suitability

Sample: *Standard solution*

[NOTE—The retention time for piroxicam is about 7 min.]

Suitability requirements

Relative standard deviation: NMT 2.8% for replicate injections

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

Calculate the percentage of the labeled amount of piroxicam ($C_{15}H_{13}N_3O_4S$) in the portion of Cream taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Piroxicam RS in the *Standard solution* (μ g/mL)

C_U = nominal concentration of piroxicam in the *Sample solution* (μ g/mL)

Acceptance criteria: 90.0%–110.0%

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE: Package in a tight, light-resistant, plastic resealable container. Store at controlled room temperature.

• BEYOND-USE DATE: NMT 90 days after the date on which it was compounded when stored at controlled room temperature

• LABELING: Label it to state the *Beyond-Use Date*.

• USP REFERENCE STANDARDS (11)

USP Piroxicam RS

Piroxicam Compounded Oral Suspension**DEFINITION**

Piroxicam Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of piroxicam ($C_{15}H_{13}N_3O_4S$).

Prepare Piroxicam Compounded Oral Suspension 10 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Piroxicam powder	1 g
Ora-Blend, ^a a sufficient quantity to make	100 mL

^a Perrigo, Minneapolis, MN.

Pour the weighed *Piroxicam powder* into a suitable mortar. Wet the powder with a small amount of *Ora-Blend*, and triturate to make a smooth paste. Add the *Ora-Blend* in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated container. Add sufficient *Ora-Blend* to bring the preparation to final volume. Shake to mix well.

ASSAY**• PROCEDURE**

Mobile phase: Mix 500 mL of methanol and 500 mL of 0.1 M sodium acetate, and adjust with phosphoric acid to a pH of 4.0. Add 10 mL of acetonitrile, filter, and degas.

Standard solution: 0.2 mg/mL of piroxicam prepared from USP Piroxicam RS in methanol

Sample solution: Shake thoroughly each bottle of Oral Suspension. Transfer 1.0 mL of the Oral Suspension into a 50-mL volumetric flask, dilute with methanol to volume, and mix well to dissolve. Pass through a PVDF filter of 0.45- μ m pore size, discarding the first 3 mL of filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 361 nm

Column: 3.9-mm \times 15-cm; 4- μ m packing L7

Flow rate: 1.0 mL/min

Injection volume: 5 μ L

System suitability

Sample: *Standard solution*

[NOTE—The retention time for piroxicam is about 4.0 min.]

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of piroxicam ($C_{15}H_{13}N_3O_4S$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of piroxicam from the *Sample solution*

r_S = peak response of piroxicam from the *Standard solution*

C_s = concentration of piroxicam in the *Standard solution* (mg/mL)

C_u = nominal concentration of piroxicam in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- **PH (791):** 3.7–4.7

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at 2°–8° or at controlled room temperature.
- **LABELING:** Label it to indicate that it is to be well-shaken before use, and to state the *Beyond-Use Date*.
- **BEYOND-USE DATE:** NMT 90 days after the date on which it was compounded when stored at 2°–8° or controlled room temperature
- **USP REFERENCE STANDARDS (11)**
USP Piroxicam RS

Plantago Seed

DEFINITION

Plantago Seed is the cleaned, dried, ripe seed of *Plantago psyllium* auct. or of *Plantago indica* L. (*Plantago arenaria* Waldst. & Kit.), known in commerce as Spanish or French psyllium; or of *Plantago ovata* Forssk., known in commerce as blond psyllium, or Indian plantago seed (Fam. Plantaginaceae).

SPECIFIC TESTS

- **BOTANIC CHARACTERISTICS**

Macroscopic

Unground *Plantago psyllium* auct. seed: Ovate to ovate-elongate, concavo-convex; mostly from 1.3 to 2.7 mm in length, rarely up to 3 mm, and from 600 μ m to 1.1 mm in width. It is light brown to moderate brown, darker along the margin, and very glossy; the convex dorsal surface exhibiting a lighter colored longitudinal area extending nearly the length of the seed and representing the embryo lying beneath the seed coat, and showing a sometimes indistinct transverse groove nearer the broader end. The concave ventral surface has a deep cavity, in the center of the base of which is an oval, yellowish white hilum.

Unground *Plantago indica* seed: Ovate-oblong to elliptical, concavo-convex; from 1.6 to 3 mm in length and from 1 to 1.5 mm in width. Externally it is dark reddish brown to moderate yellowish brown, occasionally somewhat glossy, often dull, rough, and reticulate; the convex dorsal surface having a longitudinal lighter colored area extending lengthwise along the center and beneath the seed coat, and a median transverse groove, dent, or fissure. The ventral surface has a deep concavity, the edges somewhat flattened and frequently forming a sharp indented angle with the base of the cavity, the latter showing a light colored oval hilum.

Unground *Plantago ovata* seed: Broadly elliptical to ovate, boat-shaped, from 2 to 3.5 mm in length and from 1 to 1.5 mm in width. It is pale brown to moderate brown with a dull surface, the convex surface having a small, elongated, glossy brown spot. The concave surface has a deep cavity, in the center of the base of which occurs a hilum covered with a thin membrane.

Odor and taste: All varieties of Plantago Seed are nearly odorless.

Microscopic: Plantago Seed is reniform in median transverse sections. Its seed coat has a colorless epidermis of mucilaginous cells whose radial and outer walls

break down to form layers of mucilage when brought into contact with water, and a reddish brown to yellow pigment layer in the seeds of *Plantago indica* and *Plantago psyllium*, a broad endosperm with thick-walled outer palisade cells, and irregular inner endosperm cells; and a straight embryo extending lengthwise through the center. The endosperm and embryo cells contain fixed oil and aleurone grains, the latter being rounded, oval, pyriform, or irregularly shaped, from 2 to 8 μ m in diameter.

- **WATER ABSORPTION**

Sample: 1 g of Plantago Seed

Analysis: Place the *Sample* in a 25-mL graduated cylinder, add water to the 20-mL mark, and shake the cylinder at intervals during 24 h. Allow the seeds to settle for 12 h, and note the total volume occupied by the swollen seeds.

Acceptance criteria: Seeds occupy the following volumes: *Plantago psyllium*, NLT 14 mL; *Plantago ovata*, NLT 10 mL; *Plantago indica*, NLT 8 mL.

- **ARTICLES OF BOTANICAL ORIGIN, Foreign Organic Matter (561):** NMT 0.50%
- **ARTICLES OF BOTANICAL ORIGIN, Total Ash (561):** NMT 4.0%
- **ARTICLES OF BOTANICAL ORIGIN, Acid-Insoluble Ash (561):** NMT 1.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, secure against insect attack.

Plasma Protein Fraction

» Plasma Protein Fraction conforms to the regulations of the federal Food and Drug Administration concerning biologics (640.90 to 640.96) (see *Biologics* (1041)). It is a sterile preparation of serum albumin and globulin obtained by fractionating material (source blood, plasma, or serum) from healthy human donors, the source material being tested for the absence of hepatitis B surface antigen. It is made by a process that yields a product having protein components of approved composition and sedimentation coefficient content. Not less than 83 percent of its total protein is albumin and not more than 17 percent of its total protein consists of alpha and beta globulins. Not more than 1 percent of its total protein has the electrophoretic properties of gamma globulin. It is a solution containing, in each 100 mL, 5 g of protein, and it contains not less than 94 percent and not more than 106 percent of the labeled amount. It contains no added antimicrobial agent, but it contains sodium acetyltrypophanate with or without sodium caprylate as a stabilizing agent. It has a sodium content of not less than 130 mEq per L and not more than 160 mEq per L and a potassium content of not more than 2 mEq per L. It has a pH between 6.7 and 7.3, measured in a solution diluted to contain 1 percent of protein with 0.15 M sodium chloride. It meets the requirements of the test for heat stability.

Packaging and storage—Preserve at the temperature indicated on the label.

Expiration date—The minimum expiration date is not later than 5 years after issue from manufacturer's cold storage (5°, 1 year) if labeling recommends storage between 2° and 10°; not later than 3 years after issue from manufacturer's cold storage (5°, 1 year) if labeling recommends storage at temperatures not higher than 30°.

Labeling—Label it to state that it is not to be used if it is turbid and that it is to be used within 4 hours after the container is entered. Label it also to state the osmotic equivalent in terms of plasma and the sodium content.

Podophyllum

» Podophyllum consists of the dried rhizomes and roots of *Podophyllum peltatum* L. (Fam. Berberidaceae). It yields not less than 5.0 percent of podophyllum resin.

Botanic characteristics—

Podophyllum—Consists of nearly cylindrical rhizomes, jointed, compressed or flattened somewhat on upper and lower surfaces, and sometimes branched. It occurs as pieces of rhizome up to 20 cm in length, with internodes from 2 mm to 9 mm in diameter, some of the nodes being somewhat thickened. The rhizome is dusky red to light yellowish brown, longitudinally wrinkled or nearly smooth, with irregular, somewhat V-shaped scars of scale leaves; some of the nodes are annulate, the upper portion having large, circular, depressed stem-scars and buds or stem-bases. On the lower portion there are numerous root-scars or roots, the latter from 2 cm to 7 cm in length and about 2 mm in thickness. The fracture is short and weak, the fractured surface being yellowish orange to pale yellow or grayish white.

Histology—The rhizome shows an outer portion consisting of a brown epidermis, often necrosed, and 1 to 3 layers of brown to olive-brown suberized cells; a cortex about 20 cells in width, consisting chiefly of nearly isodiametric cells, the cells containing single or compound starch grains and resin masses and, in scattered cells of the nodes, rosette aggregates of calcium oxalate; a circle of from 16 to 34 open collateral vascular bundles, separated by rather wide medullary rays, each bundle containing a few lignified vessels, a more or less distinct cambium, and a rather large phloem. The pith is large, the cells being more or less rounded and containing starch grains and reddish brown resin masses. The roots show an epidermal layer of brownish suberized cells and a single row of hypodermal cells; a broad cortex of thin-walled nearly isodiametric cells; a distinct endodermis of tangentially elongated cells having uniformly thickened walls; and a 4- to 7-rayed vascular bundle.

Powdered Podophyllum—It is pale brown to weak yellow and has a slight odor. It contains numerous starch grains, simple or 2- to 6-compound, the individual grains being spheroidal, plano- to angular-convex, or polygonal, up to 20 µm in diameter; occasional rosette aggregates of calcium oxalate, up to 80 µm in diameter; vessels with simple pits or reticulate thickenings; fragments of starch- and resin-bearing parenchyma and reddish brown to yellow cork cells.

Indian podophyllum—*Podophyllum peltatum* is differentiated from *Podophyllum hexandrum* Royle (Indian podophyllum) by the reaction described in the test for *Distinction from resin of Indian podophyllum* under *Podophyllum Resin*.

Acid-insoluble ash (561): not more than 2.0%.

Foreign organic matter (561): not more than 2.0%.

Assay—Place 10 g of Podophyllum, in fine powder, in a 125-mL conical flask, add 35 mL of alcohol, and reflux on a steam bath for 3 hours. Transfer the mixture to a small per-

colator, and percolate slowly with warm alcohol until the percolate measures 95 mL. Cool, add sufficient alcohol to the percolate to make it measure 100.0 mL, and mix. Transfer 10.0 mL of this percolate to a separator, and add 10 mL of chloroform and 10 mL of dilute hydrochloric acid (7 in 500). Shake the mixture, allow it to separate, draw off the alcohol-chloroform layer into a second separator, and wash the acid layer with three 15-mL portions of a mixture of chloroform and alcohol (2:1), adding the washings to the second separator. Add 10 mL of dilute hydrochloric acid (7 in 500) to the combined extract and washings, again shake the mixture, allow it to separate, and draw off the alcohol-chloroform layer into a tared vessel. Wash the acid layer three times with 15-mL portions of the alcohol-chloroform mixture, adding the washings to the tared vessel. Evaporate the combined extracts on a steam bath to approximately 1 mL, add 5 mL of dehydrated alcohol, again evaporate to dryness, and dry the residue at 80° for 4 hours: the weight of this residue is the weight of resin in 1 g of the Podophyllum taken.

Podophyllum Resin

» Podophyllum Resin is the powdered mixture of resins extracted from Podophyllum by percolation with Alcohol and subsequent precipitation from the concentrated percolate upon addition to acidified water. It contains not less than 40.0 percent and not more than 50.0 percent of hexane-insoluble matter. [Caution—Podophyllum Resin is highly irritating to the eye and to mucous membranes in general.]

Packaging and storage—Preserve in tight, light-resistant containers.

Identification—

A: It is soluble in 1 N potassium hydroxide or in 1 N sodium hydroxide, forming a yellow liquid, which gradually becomes darker on standing and from which the resin is precipitated by hydrochloric acid.

B: A hot solution of it deposits most of its solids on cooling, and if the cooled liquid is filtered, the filtrate turns brown upon the addition of a few drops of ferric chloride TS.

Residue on ignition (281): not more than 1.5%.

Distinction from resin of Indian podophyllum—Add 400 mg to 3 mL of 60 percent alcohol, then add 0.5 mL of 1 N potassium hydroxide, shake the mixture gently, and allow to stand for 2 hours: it does not gelatinize.

Hexane-insoluble matter—Transfer about 1 g of Podophyllum Resin, accurately weighed, to a glass-stoppered, 100-mL conical flask, add 30.0 mL of chloroform, insert the stopper tightly, and shake for 30 minutes, using a mechanical wrist-action shaker, or equivalent. Filter with suction through a medium- or fine-porosity, sintered-glass filter, into a small filter flask. Wash the conical flask and the filter with two 5-mL portions of chloroform, adding the washings to the filtrate. Transfer the filtrate with the aid of chloroform to a 50-mL volumetric flask, add chloroform to volume, and mix. Pipet 20 mL of the resulting solution into a 250-mL conical flask containing 160 mL of solvent hexane. Gently swirl, allow to stand for 10 minutes, and transfer the resulting precipitate to a tared, fine-porosity, sintered-glass filter, wash the flask and the precipitate with two 20-mL portions of solvent hexane, dry the precipitate at 70° for 1 hour, and weigh the *Hexane-insoluble matter* so obtained. Multiply by 2.5 to find the amount present in the quantity of Podophyllum Resin taken.

Podophyllum Resin Topical Solution

» Podophyllum Resin Topical Solution is a solution in Alcohol consisting of Podophyllum Resin and an alcoholic extract of Benzoin. It contains, in each 100 mL, not less than 10 g and not more than 13 g of hexane-insoluble matter. [Caution—Podophyllum Resin Topical Solution is highly irritating to the eye and to mucous membranes in general.]

Packaging and storage—Preserve in tight, light-resistant containers.

Identification—

A: A 1 in 5 solution in chloroform is levorotatory.

B: The precipitate obtained as directed in the test for *Hexane-insoluble matter* responds to *Identification test A* under *Podophyllum Resin*.

Alcohol Determination (611): between 69.0% and 72.0% of C_2H_5OH .

Hexane-insoluble matter—Using a 10.0-mL quantity of the Topical Solution, proceed as directed for *Hexane-insoluble matter* under *Podophyllum Resin*. Multiply the weight of hexane-insoluble matter found by 2.5 to find the amount present in the 10.0 mL taken.

Poloxalene

Oxirane, methyl-, polymer with oxirane.

Polyethylene-polypropylene glycol [9003-11-6].

» Poloxalene is a synthetic block copolymer of ethylene oxide and propylene oxide. It contains not less than 98.0 percent and not more than 103.0 percent of poloxalene.

Packaging and storage—Preserve in tight containers, protected from light. Store in a cool place.

USP Reference standards (11)—

USP Poloxalene RS

Labeling—Label it to indicate that it is for veterinary use only.

Identification—

Color reagent—Dissolve 12.7 g of ammonium thiocyanate and 2.0 g of cobalt nitrate in 100 mL of water.

Procedure—Add 10 mL of ethylene chloride to 0.5 g of Poloxalene, and shake for 1 minute. Add 1 mL of *Color reagent*, and shake for 1 minute: a blue color is produced in the lower layer.

Average molecular weight—

Phthalic anhydride-pyridine solution—Prepare as directed in the test for *Average molecular weight* under *Poloxamer*.

Procedure—Using about 12 g of Poloxalene, accurately weighed, proceed as directed for *Procedure* in the test for *Average molecular weight* under *Poloxamer*: the average molecular weight is between 2850 and 3150.

pH (791): between 5.0 and 7.5, in a solution (1 in 40).

Water Determination, Method Ia (921): not more than 0.4%.

Hydroxyl value (401)—

Esterification reagent—Dissolve 166 g of phthalic anhydride and 28 g of imidazole in 1000 mL of pyridine, and allow to stand for 2 hours before using. Store in a light-resistant bottle.

Procedure—Transfer a quantity of Poloxalene, determined by dividing 420 by the expected hydroxyl value and accurately weighed, to a glass-stoppered, 250-mL conical flask, and add 25.0 mL of *Esterification reagent*. Transfer 25.0 mL of *Esterification reagent* to a second glass-stoppered, 250-mL conical flask to provide the reagent blank. Add glass beads to the flasks, swirl to dissolve the Poloxalene, and fit both flasks with glass-jointed reflux condensers previously rinsed with 10 mL of pyridine, and heat on a steam bath for 15 minutes. Add 10 mL of pyridine through each condenser, insert the stoppers, and cool under running water for 1 minute. After removing the condensers, add 10 mL of water and 1 mL of phenolphthalein TS, and titrate with 0.5 N sodium hydroxide VS to a light pink endpoint that persists for at least 15 seconds. Calculate the hydroxyl value by the formula:

$$(56.11N / W)(B - U)$$

in which N is the normality of the 0.5 N sodium hydroxide titrant; W is the weight, in g, of the Poloxalene taken; B and U are the volumes, in mL, of 0.5 N sodium hydroxide consumed by the reagent blank and the solution of Poloxalene, respectively. [NOTE—If B minus U is greater than 10 mL, repeat the test using a smaller sample.] The hydroxyl value is between 36.0 and 40.0.

Cloud point—Add 10 g of Poloxalene to 190.0 mL of water in a 250-mL beaker. Add a magnetic stirring bar, place on a stirrer and hot plate, and stir until dissolution is complete. Place a probe from an electronic thermometer with an accuracy of 0.2° in the solution within 3 mm of the stirring bar. Continue stirring at a rate that minimizes the formation of bubbles. Adjust the hot plate so that the temperature of the solution increases at a rate of about 1° per minute. Continue to view the solution, and record the temperature when the probe can no longer be seen. This occurs between 42.5° and 46.5° .

Assay—

Standard preparation—Dissolve an accurately weighed quantity of USP Poloxalene RS in ethylene dichloride to obtain a solution having a known concentration of about 0.1575 mg per mL.

Assay preparation—Transfer about 105 mg of Poloxalene, accurately weighed, to a 100-mL volumetric flask, add about 85 mL of ethylene dichloride, and swirl to dissolve. Dilute with ethylene dichloride to volume, and mix. Transfer 15.0 mL of this solution to a second 100-mL volumetric flask, dilute with ethylene dichloride to volume, and mix.

Procedure—Transfer 10.0 mL of the *Standard preparation*, the *Assay preparation*, and ethylene dichloride (to serve as a blank) to glass-stoppered tubes, add 4.0 mL of the *Color reagent* specified in the *Identification* test, shake vigorously for 3 minutes, and then centrifuge for 5 minutes. Carefully remove the lower ethylene dichloride layers from the three tubes, and using the ethylene dichloride layer from the tube containing the blank to zero the spectrophotometer, determine the UV absorbance at 630 nm of the solutions from the *Standard preparation* and the *Assay preparation*. Calculate the percentage of poloxalene in the portion of Poloxalene taken by the formula:

$$100(A_U / A_S)(C_S / C_U)$$

in which A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively; and C_S and C_U are the concentrations, in mg per mL, of the *Standard preparation* and the *Assay preparation*, respectively.

Polycarbophil

Polycarbophil.
Polycarbophil [9003-97-8].

» Polycarbophil is polyacrylic acid cross-linked with divinyl glycol.

Packaging and storage—Preserve in tight containers.

Identification—

A: A dispersion (1 in 100) is orange with thymol blue TS and yellow with cresol red TS.

B: Adjust a dispersion (1 in 100) with 1 M sodium hydroxide to a pH of about 7.5. A very viscous gel is produced.

pH (791)—To 1.0 g add 100 mL of water, and shake by mechanical means for 1 hour: the pH of the mixture is not more than 4.0.

Loss on drying (731)—Dry it in vacuum at 45° for 4 hours: it loses not more than 1.5% of its weight.

Residue on ignition (281): not more than 4.0%.

Absorbing power—Transfer about 50 mg, accurately weighed, to an accurately tared 50-mL centrifuge tube fitted with a tight closure. Add 35 mL of sodium bicarbonate solution (1.5 in 100), and shake manually, venting as necessary to release liberated carbon dioxide. Shake and vent at least 3 times. Close the tube tightly, and shake vigorously by mechanical means for 60 minutes. Centrifuge at 2000 rpm for 1 hour. By means of a 50-mL syringe fitted with a 13-gauge needle, draw off the supernatant taking care that the solid material is not disturbed. Repeat the process of the addition of 35 mL of sodium bicarbonate solution, of the shaking, and of the withdrawing of supernatant. Accurately weigh the tube with its contents, and calculate the weight of the absorbed solution by subtracting the weight of Polycarbophil taken and the tare weight of the tube. The absorbed weight is not less than 62 g per g of Polycarbophil on the dried basis.

Limit of acrylic acid—

pH 3.0 phosphate buffer—Prepare 0.01 M monobasic potassium phosphate, and adjust with phosphoric acid to a pH of 3.0 ± 0.5.

Mobile phase—Prepare a degassed solution consisting of pH 3.0 phosphate buffer and methanol (8:2).

Standard solution—Dissolve an accurately weighed quantity of acrylic acid in water to obtain a solution containing 1.0 mg per mL. Dilute quantitatively, and stepwise if necessary, with a 2.5% alum solution to obtain a solution having a known concentration of about 30 µg per mL.

Test solution—Transfer about 0.1 g of Polycarbophil into a vial. Add 20 mL of a 2.5% alum solution and mix. Heat at 50° for 20 minutes, then shake for 1 hour, centrifuge, and filter.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 210-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard solution*, and record peak responses as directed for *Procedure*: the relative standard deviation for replicate injections of the *Standard solution* is not more than 5.0%, and the tailing factor is not more than 2.5.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the response for the acrylic acid peak. Calculate the percentage of

acrylic acid in the portion of Polycarbophil taken by the formula:

$$(0.002C / W)(r_U / r_S)$$

in which *C* is the concentration, in µg per mL, of acrylic acid, *W* is the weight, in g, of Polycarbophil taken, and *r_U* and *r_S* are the acrylic acid peak responses obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.3% acrylic acid is found.

Limit of ethyl acetate—

Internal standard solution—Dissolve an accurately weighed quantity of methyl ethyl ketone in methanol, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.075 mg per mL.

Standard solution—Dissolve 0.225 mg, accurately weighed, of ethyl acetate into a 10-mL volumetric flask. Add 2.0 mL of the *Internal standard solution*, dilute with methanol to volume, and mix.

Test solution—Transfer about 50 mg of Polycarbophil into a 10-mL volumetric flask. Add 2.0 mL of the *Internal standard solution*, dilute with methanol to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 10-ft. × 2-mm column that contains 1% liquid phase G25 on support S12. The column is maintained at about 160°, and the injection port and detector block are maintained at about 250°. The carrier gas is dry helium flowing at a rate of about 30 mL per minute. Chromatograph the *Standard solution*, and record the chromatogram as directed for *Procedure*: the relative retention times are about 1.3 for ethyl acetate, and 1.0 for methyl ethyl ketone, and the relative standard deviation for replicate injections of the ethyl acetate peak is not more than 2%.

Procedure—Separately inject equal volumes (about 2 µL) of the *Test solution* and the *Standard solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of ethyl acetate in the portion of Polycarbophil taken by the formula:

$$(0.001C / W)(R_U / R_S)$$

in which *C* is the concentration of ethyl acetate, in µg per mL, *W* is the weight of Polycarbophil, in g, and *R_U* and *R_S* are the ratios of the responses of the ethyl acetate peak to the methyl ethyl ketone peak obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.45% is found.

Polyethylene Glycol 3350

Poly(oxy-1,2-ethanediyl), α-hydro-ω-hydroxy-; 1,2-Ethanediol, homopolymer [25322-68-3].

DEFINITION

Polyethylene Glycol 3350 is an addition polymer of ethylene oxide and water, represented by the formula $H(OCH_2CH_2)_nOH$, in which *n* represents the average number of oxyethylene groups. The apparent weight-average molecular weight is 3015–3685 g/mol (Da). It contains NLT 97.0% and NMT 103.0% of polyethylene glycol 3350, calculated on the anhydrous basis. It may contain a suitable antioxidant.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197F) or (197A): Use a thin film of test specimen, melted if necessary, in the range from 4000 to 650 cm⁻¹, when the measurement is performed by using (197F).

B. CHROMATOGRAPHIC IDENTITY

Analysis: Proceed as directed in the Assay.

Acceptance criteria: The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*.

ASSAY

PROCEDURE

Mobile phase: 50 µg/mL of sodium azide in water

Standard solution: 20 mg/mL of USP Polyethylene Glycol 3350 RS in *Mobile phase*

Sample solution: 20 mg/mL of Polyethylene Glycol 3350 in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Differential refractive index

Columns

Guard: 6-mm × 4-cm; 6-µm packing L25

Analytical: 7.8-mm × 30-cm; 6-µm packing L25

Temperatures

Detector: 35 ± 1°

Column: 35 ± 1°

Flow rate: 0.8 mL/min

Injection volume: 20 µL

System suitability

Sample: *Standard solution*

[NOTE—The retention time for polyethylene glycol 3350 is about 8.5 min.]

Suitability requirements

Relative standard deviation: NMT 1.5%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of polyethylene glycol 3350 [$\text{H}(\text{OCH}_2\text{CH}_2)_n\text{OH}$] in the portion of Polyethylene Glycol 3350 taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response from the *Sample solution*

r_s = peak response from the *Standard solution*

C_s = concentration of USP Polyethylene Glycol 3350 RS in the *Standard solution* (mg/mL)

C_u = concentration of Polyethylene Glycol 3350 in the *Sample solution* (mg/mL)

Acceptance criteria: 97.0%–103.0% on the anhydrous basis

IMPURITIES

RESIDUE ON IGNITION (281)

Sample: 2 g

Analysis: Proceed as directed, moistening the residue with 2 mL of sulfuric acid.

Acceptance criteria: NMT 0.1%

Delete the following:

HEAVY METALS (231)

Test preparation: 4.0 g in 5.0 mL of 0.1 N hydrochloric acid. Dilute with water to 25 mL.

Acceptance criteria: NMT 5 µg/g (Official 1-Jan-2018)

LIMIT OF ETHYLENE OXIDE AND DIOXANE

Analysis: Proceed as directed in *Ethylene Oxide and Dioxane* (228), *Method II*.

Acceptance criteria

Ethylene oxide: NMT 1 µg/g

Dioxane: NMT 10 µg/g

LIMIT OF ETHYLENE GLYCOL AND DIETHYLENE GLYCOL

Mobile phase: 50 µg/mL of sodium azide in water

Eluant: Water

Standard stock solution: 10 mg/g of USP Diethylene Glycol RS and 10 mg/g of USP Ethylene Glycol RS in *Eluant*

Standard solution: Transfer 0.1 g of *Standard stock solution* to a 100-mL volumetric flask. Dilute with water to

volume. The *Standard solution* contains 0.01 mg/mL of USP Diethylene Glycol RS and 0.01 mg/mL of USP Ethylene Glycol RS.

Sample solution: 10 mg/mL of Polyethylene Glycol 3350 in *Eluant*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Differential refractive index

Column: 7.8-mm × 30-cm; 7-µm packing L89, 125-Å pore size

Temperatures

Detector: 35 ± 1°

Column: 35 ± 1°

Flow rate: 0.5 mL/min

Injection volume: 100 µL

Run time: 30 min

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for diethylene glycol and ethylene glycol are 1.0 and 1.1, respectively.]

Suitability requirements

Resolution: NLT 0.9 between diethylene glycol and ethylene glycol

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of diethylene glycol (or ethylene glycol) in the portion of Polyethylene Glycol 3350 taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response of diethylene glycol (or ethylene glycol) from the *Sample solution*

r_s = peak response of diethylene glycol (or ethylene glycol) from the *Standard solution*

C_s = concentration of USP Diethylene Glycol RS (or USP Ethylene Glycol RS) in the *Standard solution* (mg/mL)

C_u = concentration of Polyethylene Glycol 3350 in the *Sample solution* (mg/mL)

Acceptance criteria

Ethylene glycol: NMT 0.062%

Sum of diethylene glycol and ethylene glycol: NMT 0.2%

LIMIT OF FORMALDEHYDE AND ACETALDEHYDE

Solution A: Water

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time ^a (min)	Solution A (%)	Solution B (%)
0	50	50
11	0	100

^a The equilibration time is 5 min.

[NOTE—Use amber containers and amber autosampler vials.]

2,4-DNPH solution: Transfer 250 mg of 2,4-dinitrophenylhydrazine (2,4-DNPH) to a 50-mL volumetric flask, add 20.0 mL of acetonitrile, and swirl to mix. Add 3.0 mL of hydrochloric acid to the flask, and swirl to mix. Sonicate until all solids are dissolved, and dilute with acetonitrile to volume.

Formaldehyde-2,4-DNPH solution: 100 µg/mL of aldehyde equivalent in acetonitrile¹

Acetaldehyde-2,4-DNPH solution: 1000 µg/mL of aldehyde equivalent in acetonitrile²

Formaldehyde stock solution: Transfer 500 µL of *Formaldehyde-2,4-DNPH solution* to a 10-mL volumetric

¹ Available from Sigma-Aldrich Corporation, or equivalent.

² Available from Sigma-Aldrich Corporation, or equivalent.

flask. Dilute with acetonitrile to volume. The formaldehyde concentration is 5.0 µg/mL.

Acetaldehyde stock solution: Transfer 500 µL of *Acetaldehyde-2,4-DNPH solution* to a 10-mL volumetric flask. Dilute with acetonitrile to volume. The acetaldehyde concentration is 50.0 µg/mL.

Standard solution: Transfer 1.5 mL of *Formaldehyde stock solution* and 1.2 mL of *Acetaldehyde stock solution* to a 10-mL volumetric flask. Dilute with acetonitrile to volume, and mix well. The concentrations of formaldehyde and acetaldehyde are 0.75 and 6.0 µg/mL, respectively.

Sample solution: Transfer 0.5 g of Polyethylene Glycol 3350 to a 10-mL volumetric flask. Add 1.0 mL of acetonitrile to the flask, and swirl to dissolve the sample. Add 2.0 mL of *2,4-DNPH solution* to the flask, and swirl to mix. Allow the solution to react for 15 min, then dilute with acetonitrile to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 360 nm

Column: 3.0-mm × 15-cm; 3.5-µm packing L7, 80-Å pore size

Column temperature: 30 ± 1°

Flow rate: 0.65 mL/min

Injection volume: 5 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for formaldehyde and acetaldehyde are 1.0 and 1.2, respectively.]

Suitability requirements

Resolution: NLT 2.0 between formaldehyde and acetaldehyde

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the content of formaldehyde (or acetaldehyde), in µg/g, in the portion of Polyethylene Glycol 3350 taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u)$$

r_u = peak response of formaldehyde (or acetaldehyde) from the *Sample solution*

r_s = peak response of formaldehyde (or acetaldehyde) from the *Standard solution*

C_s = concentration of formaldehyde (or acetaldehyde) in the *Standard solution* (µg/mL)

C_u = concentration of Polyethylene Glycol 3350 in the *Sample solution* (g/mL)

Acceptance criteria

Formaldehyde: NMT 15 µg/g

Sum of formaldehyde and acetaldehyde: NMT 200 µg/g

SPECIFIC TESTS

• APPARENT WEIGHT-AVERAGE MOLECULAR WEIGHT AND POLYDISPERSITY

Mobile phase: Water

Standard solution: 1.0 mg/mL each of five polyethylene glycol standards with molecular weights of 1000, 2000, 3000, 4000, and 6000 g/mol (Da) in *Mobile phase*. Pass a portion of the solution through a 0.45-µm polytetrafluoroethylene (PTFE) syringe filter.³ Discard the first 2 mL, and transfer the solution for analysis.

Sample solution: 1.0 mg/mL of Polyethylene Glycol 3350 in *Mobile phase*. Pass a portion of the solution through a 0.45-µm PTFE syringe filter.³ Discard the first 2 mL, and transfer the solution for analysis.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Differential refractive index

Column: 7.8-mm × 30-cm; 6-µm packing L37

Temperatures

Detector: 35 ± 1°

Column: 35 ± 1°

Flow rate: 0.8 mL/min

Injection volume: 10 µL

Run time: 18 min

Analysis

Samples: *Standard solution* and *Sample solution*

Separately inject equal volumes of the *Standard solution* and the *Sample solution* into the chromatograph, record the chromatograms, and determine the elution peak maxima and the corresponding retention times for the five polyethylene glycol standards.

Calibration curve: Plot the retention times on the x-axis against the log M_p (M_p : peak molecular weights) on the y-axis for the peaks from the polyethylene glycol standard to generate a calibration curve using suitable gel permeation chromatography or size exclusion chromatography (GPC/SEC) software.

Calculations: Compute the data using the same GPC/SEC software, and determine the number- and weight-average molecular weights, M_N and M_W , in g/mol (Da), respectively, for the chromatogram of the *Sample solution*.

Calculate the polydispersity for Polyethylene Glycol 3350:

$$\text{Result} = M_W/M_N$$

M_W = weight-average molecular weight from the *Sample solution* (g/mol)

M_N = number-average molecular weight from the *Sample solution* (g/mol)

Acceptance criteria: The value of apparent weight-average molecular weight is 3015–3685 g/mol. Polydispersity is 90%–110% of the value stated on the label or within the range indicated on the label.

• HYDROXYL VALUE

Phthalic anhydride solution: Place 49.0 g of phthalic anhydride into an amber bottle, and dissolve in 300 mL of pyridine from a freshly opened bottle or pyridine that has been freshly distilled over phthalic anhydride. Shake vigorously until completely dissolved. Add 7 g of imidazole, swirl carefully to dissolve, and allow to stand for 16 h before using.

Sample solution: Carefully introduce 25.0 mL of *Phthalic anhydride solution* into a dry, heat-resistant pressure bottle. Add 12.0 g of Polyethylene Glycol 3350. Add 25 mL of pyridine, from a freshly opened bottle or pyridine that has been freshly distilled over phthalic anhydride. Swirl to dissolve, insert the stopper in the bottle, and wrap it securely in a cloth bag.

Blank: 25.0 mL of *Phthalic anhydride solution* plus any additional pyridine added to the bottle

Analysis: Immerse the bottle in a water bath maintained at a temperature between 96° and 100°, to the same depth as that of the mixture in the bottle. Remove the bottles from the bath after 5 min and, without unwrapping, swirl for 30 s to homogenize. Heat in the water bath for 60 min, then remove from the bath, and allow it to cool to room temperature. Uncap the bottle carefully to release any pressure, remove from the bag, add 10 mL of water, and swirl thoroughly. Wait 2 min, add 0.5 mL of a solution of phenolphthalein in pyridine (1 in 100), and titrate with 0.5 N sodium hydroxide VS to the first pink color that persists for 15 s. Perform a blank determination.

Calculate the hydroxyl value:

$$\text{Result} = [M_r \times (V_B - V_s) \times N]/W$$

³ Millipore® Millex® LCR HPLC syringe filters with hydrophilic PTFE membrane is suitable, or any other equivalent filter.

- M_r = molecular weight of potassium hydroxide, 56.11
 V_B = volume of 0.5 N sodium hydroxide consumed in the blank test (mL)
 V_S = volume of 0.5 N sodium hydroxide consumed in the actual test (mL)
 N = exact normality of the sodium hydroxide solution
 W = weight of Polyethylene Glycol 3350 taken for the test (g)

Acceptance criteria: 30–38

• ACIDITY AND ALKALINITY

Sample solution: Dissolve 5.0 g of Polyethylene Glycol 3350 in 100 mL of carbon dioxide-free water.

Analysis: Add 0.3 mL of a saturated solution of potassium chloride into the *Sample solution*. The test solution should be maintained at $25 \pm 2^\circ$ during the measurement. Measure the pH following pH (791).

Acceptance criteria: 4.5–7.5

• WATER DETERMINATION (921), Method I

Sample: 2.0 g

Acceptance criteria: NMT 1.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, protected from direct sunlight. Avoid exposure to excessive heat.
- **LABELING:** Label it to indicate its polydispersity (M_w/M_n) or its polydispersity range. Label it to indicate the name and amount of any added antioxidant.
- **USP REFERENCE STANDARDS (11)**
 USP Diethylene Glycol RS
 USP Ethylene Glycol RS
 USP Polyethylene Glycol 3350 RS

Polyethylene Glycol 3350 and Electrolytes for Oral Solution

(Prior to August 1, 2012, the current practice of labeling the article of commerce with the name PEG 3350 and Electrolytes for Oral Solution may be continued. Use of the name Polyethylene Glycol 3350 and Electrolytes for Oral Solution will be permitted as of August 1, 2007, but the use of this name will not be mandatory until August 12, 2012. The 60-month extension will provide the time needed by the manufacturers and users to make necessary changes.)

» Polyethylene Glycol 3350 and Electrolytes for Oral Solution is a mixture of Polyethylene Glycol 3350, Sodium Bicarbonate, Sodium Chloride, Sodium Sulfate (anhydrous), and Potassium Chloride. When constituted as directed in the labeling it contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of polyethylene glycol 3350, potassium (K^+), sodium (Na^+), bicarbonate (HCO_3^-), chloride (Cl^-), and sulfate (SO_4^{2-}), the labeled amounts per L being 10 mmol (10 mEq) of potassium, 125 mmol (125 mEq) of sodium, 20 mmol (20 mEq) of bicarbonate, 35 mmol (35 mEq) of chloride, and 40 mmol (80 mEq) of sulfate.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Polyethylene Glycol 3350 RS

Completeness of solution (641): meets the requirements.

Identification—

A: The IR absorption spectrum of a mineral oil dispersion of it in a calcium fluoride cell exhibits maxima only at the same wavelengths as that of a similar preparation of USP Polyethylene Glycol 3350 RS.

B: A solution (1 in 20) responds to the tests for *Sodium* (191), *Potassium* (191), *Bicarbonate* (191), *Sulfate* (191), and *Chloride* (191).

pH (791): between 7.5 and 9.5, in the solution prepared as directed in the labeling.

Uniformity of dosage units (905): meets the requirements.

Osmolality and Osmolarity (785), Osmolality: between 235 and 304 mOsmol, in the solution prepared as directed in the labeling.

Assay for potassium and sodium—

Mobile phase—Dilute 0.5 mL of nitric acid with water to obtain 4000 mL of solution. Degas, and place the solution in a suitable plastic container. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Internal standard solution—Dissolve a suitable quantity of ammonium bromide in water to obtain a solution having a concentration of about 2 mg per mL.

Standard preparation—To a 100-mL volumetric flask transfer about 90 mg of potassium chloride, previously dried at 105° for 2 hours and accurately weighed, and about 880 mg of sodium chloride, previously dried at 105° for 2 hours and accurately weighed, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 500-mL volumetric flask, add 10.0 mL of *Internal standard solution*, dilute with water to volume, and mix. Pass this solution through a filter having a 0.5- μ m or finer porosity, and store the filtrate in a suitable plastic container. This *Standard preparation* contains about 9 μ g (0.00012 mEq) of potassium chloride and about 88 μ g (0.0015 mEq) of sodium chloride per mL.

Assay preparation—Constitute the contents of a container of Polyethylene Glycol 3350 and Electrolytes for Oral Solution with an accurately measured volume of water, as specified in the labeling. Transfer 6.0 mL of this stock solution, equivalent to about 0.06 mEq of potassium, to a 500-mL volumetric flask, add 10 mL of *Internal standard solution*, dilute with water to volume, and mix. This solution contains about 0.00012 mEq of potassium and 0.0015 mEq of sodium per mL. [NOTE—Reserve the remaining portion of the stock solution for the *Assay for bicarbonate*, and reserve the remaining portion of the *Assay preparation* for the *Assay for chloride and sulfate* and the *Assay for polyethylene glycol 3350*.]

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a conductivity detector, a 4-mm \times 5-cm guard column containing packing L17, and a 4-mm \times 30-cm analytical column maintained at $35 \pm 1^\circ$ containing packing L17. The flow rate is about 0.9 mL per minute. Chromatograph the *Standard preparation* as directed for *Procedure*: the relative retention times are about 0.6 for sodium, 0.8 for ammonium, and 1.0 for potassium; the resolution, R , between the sodium and ammonium peaks is not less than 1.1, and between the ammonium and potassium peaks is not less than 0.9. [NOTE—Maintain column backpressure at less than 1000 pounds per square inch. Backpressure may be reduced by changing the in-line filters and frits in the columns. Column efficiency may be improved by backflushing the analytical column with 30 mL of 0.1 N nitric acid or by injecting four successive 100- μ L portions of 0.1 N nitric acid into the chromatograph.]

Procedure—[NOTE—Use peak heights where peak responses are indicated.] Separately inject equal volumes (about 10 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Cal-

culate the mEq of potassium per L of constituted Oral Solution taken by the formula:

$$(500 / 74.55)(C / 6)(R_U / R_S)$$

in which 74.55 is the molecular weight of potassium chloride; C is the concentration, in μg per mL, of potassium chloride in the *Standard preparation*; and R_U and R_S are the peak response ratios of potassium to ammonium obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the mEq of sodium per L of constituted Oral Solution taken by the formula:

$$(500 / 58.44)(C / 6)(R_U / R_S)$$

in which 58.44 is the molecular weight of sodium chloride; C is the concentration, in μg per mL, of sodium chloride in the *Standard preparation*; and R_U and R_S are the peak response ratios of sodium to ammonium obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Assay for bicarbonate—Transfer 400.0 mL of the stock solution remaining from the *Assay for potassium and sodium*, equivalent to about 672 mg of sodium bicarbonate (8 mEq), to a suitable container, add methyl red TS, and titrate with 1 N sulfuric acid VS. Calculate the mEq of bicarbonate (HCO_3^-) per L of constituted Oral Solution taken by the formula:

$$2.5V_A$$

in which V_A is the volume, in mL, of 1 N sulfuric acid consumed.

Assay for chloride and sulfate—

Mobile phase—Transfer 34 g of boric acid, 8.6 g of lithium hydroxide, 23.5 mL of gluconic acid solution (1:1), and 125 mL of glycerin to a 1000-mL volumetric flask, dissolve in water, dilute with water to volume, and mix. Add 15 mL of this buffer solution to 865 mL of water, mix, and degas. Add 120 mL of acetonitrile, mix, and degas. [NOTE—Protect the *Mobile phase* from air to prevent absorption of carbon dioxide.] Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)). Increasing the proportion of buffer solution decreases the retention times of the analytes.

Internal standard solution—Dissolve a suitable quantity of ammonium bromide in water to obtain a solution having a concentration of about 2.2 mg per mL.

Standard preparation—To a 100-mL volumetric flask transfer about 246 mg of sodium chloride (4.2 mEq), previously dried at 105° for 2 hours and accurately weighed, and about 682 mg of anhydrous sodium sulfate (9.6 mEq), previously dried at 105° for 2 hours and accurately weighed, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 500-mL volumetric flask, add 10.0 mL of *Internal standard solution*, dilute with water to volume, and mix. Filter this solution through a 0.5- μm or finer porosity filter, and store the filtrate in a suitable glass container. This *Standard preparation* contains about 24.6 μg of sodium chloride (0.00042 mEq of chloride) and about 68.2 μg of sodium sulfate (0.00096 mEq of sulfate) per mL.

Assay preparation—Use the *Assay preparation* prepared as directed in the *Assay for potassium and sodium*. This solution contains about 0.042 mEq of chloride and 0.096 mEq of sulfate per mL.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a conductivity detector, a 4-mm \times 5-cm guard column containing packing L23, and a 4-mm \times 30-cm analytical column maintained at $35 \pm 1^\circ$ containing packing L23. The flow rate is about 0.9 mL per minute. Chromatograph the *Standard preparation* as directed for *Procedure*: the relative retention times are about 0.25 for chloride, 0.4 for bromide, and 1.0 for sulfate, the resolution, R , between the chloride and bromide peaks

is not less than 1.5 and between the bromide and sulfate peaks is not less than 4.5. [NOTE—Maintain column backpressure at less than 1000 pounds per square inch. Backpressure may be reduced by changing the in-line filters and frits in the columns. Column efficiency may be improved by backflushing the analytical column with 50 mL of the buffer solution used to prepare the *Mobile phase*.]

Procedure—[NOTE—Use peak heights where peak responses are indicated.] Separately inject equal volumes (about 10 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the mEq of chloride per L of constituted Oral Solution taken by the formula:

$$(500 / 58.44)(C / 6)(R_U / R_S)$$

in which 58.44 is the molecular weight of sodium chloride, C is the concentration, in μg per mL, of sodium chloride in the *Standard preparation*, and R_U and R_S are the peak response ratios of chloride to bromide obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the mEq of sulfate per L of constituted Oral Solution taken by the formula:

$$(500 / 71.02)(C / 6)(R_U / R_S)$$

in which 71.02 is one-half of the molecular weight of sodium sulfate, C is the concentration, in μg per mL, of anhydrous sodium sulfate in the *Standard preparation*, and R_U and R_S are the peak response ratios of sulfate to bromide obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Assay for polyethylene glycol 3350—

Salt solution—Prepare a solution in water containing 0.35 mg of sodium chloride, 0.18 mg of potassium chloride, 0.40 mg of sodium bicarbonate, 1.37 mg of anhydrous sodium sulfate, and 0.88 mg of ammonium bromide per mL.

Mobile phase—Dilute 40.0 mL of *Salt solution* with water to 1000 mL. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Transfer about 360 mg of USP Polyethylene Glycol 3350 RS, accurately weighed, to a 500-mL volumetric flask, add 20.0 mL of *Salt solution* and about 250 mL of water, dissolve by swirling, dilute with water to volume, and mix. This *Standard preparation* contains about 0.72 mg of polyethylene glycol 3350 per mL.

Assay preparation—Use the *Assay preparation*, prepared as directed in the *Assay for potassium and sodium*. This solution contains about 0.72 mg of polyethylene glycol 3350 per mL.

Chromatographic system (see *Chromatography* (621))—[NOTE—Use peak heights where peak responses are indicated.] The liquid chromatograph is equipped with a refractive index detector maintained at $34 \pm 0.5^\circ$, a 7.8-mm \times 4.5-cm guard column containing packing L25, and a 7.8-mm \times 30-cm analytical column containing packing L25 and maintained at ambient temperature. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation* as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.5%. [NOTE—Maintain column backpressure at less than 1000 pounds per square inch. Backpressure may be reduced by cleaning the frits in the guard column or by replacing the guard column. Baseline drift may be reduced by maintaining strict control of ambient temperature, by insulating the lines, the *Mobile phase* reservoir, and the columns, and by increasing the time of equilibration.]

Procedure—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the con-

tent, in g, of polyethylene glycol 3350 per L of constituted Oral Solution taken by the formula:

$$500(C/6)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of polyethylene glycol 3350 in the *Standard preparation*, and r_U and r_S are the polyethylene glycol 3350 peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Polymyxin B, sulfate;

Polymyxin B sulfate [1405-20-5].

Polymyxin B [1404-26-8].

DEFINITION

Polymyxin B Sulfate is the sulfate salt of a kind of polymyxin, a substance produced by the growth of *Bacillus polymyxa* (Prazmowski) Migula (Fam. Bacillaceae), or a mixture of two or more such salts. It has a potency of NLT 6000 Polymyxin B units/mg, calculated on the dried basis.

IDENTIFICATION

- A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the test for *Composition of Polymyxins*.
- B.**

Solution A: 10 mg/mL of cupric sulfate

Sample solution: Dissolve 2 mg in 5 mL of water.

Analysis: To the *Sample solution* add 5 mL of 2.5 N sodium hydroxide, and mix. Add 5 drops of *Solution A*, shaking after the addition of each drop.

Acceptance criteria: A reddish-violet color is produced.
- C. IDENTIFICATION TESTS—GENERAL (191), Sulfate:** A 50-mg/mL solution of Polymyxin B Sulfate meets the requirements.

ASSAY

- PROCEDURE**

Analysis: Proceed with Polymyxin B Sulfate as directed for *Antibiotics—Microbial Assays* (81).

Acceptance criteria: NLT 6000 Polymyxin B units/mg on the dried basis

IMPURITIES

- RESIDUE ON IGNITION (281)**

Analysis: Proceed as directed in the chapter, moistening the charred residue with 2 mL of nitric acid and 5 drops of sulfuric acid.

Acceptance criteria: NMT 5.0% where used for prescription compounding

Change to read:

ORGANIC IMPURITIES

Buffer, Mobile phase, Diluent, Standard solution,
 Δ_{USP40} **Sample solution, Chromatographic system,**
 Δ and **System suitability:** Δ_{USP40} Proceed as directed in the test for *Composition of Polymyxins*.

Δ_{USP40}

Analysis

Samples: Δ *Standard solution* (the *Standard solution* is used to determine the disregard limit) and Δ_{USP40} *Sample solution*

Calculate the percentage of each impurity in the portion of Polymyxin B Sulfate taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_T = sum of the responses of all peaks from the *Sample solution*

Acceptance criteria: Disregard any peak less than $\Delta 0.007$ times the peak response of the polymyxin B1 peak from the *Standard solution*. Δ_{USP40}

Any individual impurity: NMT 3.0%

Total impurities: NMT 17.0%

SPECIFIC TESTS

PH (791)

Sample solution: 5 mg/mL

Acceptance criteria: 5.0–7.5

LOSS ON DRYING (731)

Analysis: Dry 100 mg in a capillary-stoppered bottle under vacuum at 60° for 3 h.

Acceptance criteria: NMT 7.0%

- STERILITY TESTS (71):** Meets the requirements where the label states that Polymyxin B Sulfate is sterile

• **PYROGEN TEST (151)**

Sample solution: Nominally 20×10^3 Polymyxin B units/mL in pyrogen-free saline TS

Analysis: Proceed as directed in the chapter using a test dose of 1.0 mL/kg.

Acceptance criteria: Meets the requirements where intended for injectable dosage forms or where the label states that Polymyxin B Sulfate must be subjected to further processing during the preparation of injectable dosage forms

Change to read:

• **COMPOSITION OF POLYMYXINS**

Buffer: 4.5 g/L of sodium sulfate anhydrous. The pH is adjusted to 2.3 with dilute phosphoric acid (10% w/w) prior to final dilution.

Mobile phase: Acetonitrile and Buffer (20:80)

Diluent: Acetonitrile and water (20:80)

Standard solution: 0.5 mg/mL of USP Polymyxin B Sulfate RS in Diluent

[▲]USP40

Sample solution: 0.5 mg/mL of Polymyxin B Sulfate in Diluent

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm \times 15-cm; 3.5- μ m packing L1.

[▲][NOTE—A 4.6-mm \times 25-cm; 5- μ m packing L1 column was also found to be suitable.][▲]USP40

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 20 μ L

Run time: 1.4 times the retention time of polymyxin B1

System suitability

Sample: Standard solution

Suitability requirements

Resolution: NLT 3.0 between polymyxin B2 and polymyxin B3

Relative standard deviation: NMT 2.0% for the polymyxin B1 peak

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of polymyxin B1 in the portion of Polymyxin B Sulfate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times 100$$

r_U = peak response of polymyxin B1 from the Sample solution

r_S = peak response of polymyxin B1 from the Standard solution

C_S = concentration of USP Polymyxin B Sulfate RS in the Standard solution (mg/mL)

C_U = concentration of Polymyxin B Sulfate in the Sample solution corrected for loss on drying (mg/mL)

P = potency of polymyxin B1 in USP Polymyxin B Sulfate RS (mg/mg)

Calculate the percentage of polymyxin B2 in the portion of Polymyxin B Sulfate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times 100$$

r_U = peak response of polymyxin B2 from the Sample solution

r_S = peak response of polymyxin B2 from the Standard solution

C_S = concentration of USP Polymyxin B Sulfate RS in the Standard solution (mg/mL)

C_U = concentration of Polymyxin B Sulfate in the Sample solution corrected for loss on drying (mg/mL)

P = potency of polymyxin B2 in USP Polymyxin B Sulfate RS (mg/mg)

Calculate the percentage of polymyxin B3 in the portion of Polymyxin B Sulfate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times 100$$

r_U = peak response of polymyxin B3 from the Sample solution

r_S = peak response of polymyxin B3 from the Standard solution

C_S = concentration of USP Polymyxin B Sulfate RS in the Standard solution (mg/mL)

C_U = concentration of Polymyxin B Sulfate in the Sample solution corrected for loss on drying (mg/mL)

P = potency of polymyxin B3 in USP Polymyxin B Sulfate RS (mg/mg)

Calculate the percentage of polymyxin B1-I in the portion of Polymyxin B Sulfate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times 100$$

r_U = peak response of polymyxin B1-I from the Sample solution

r_S = peak response of polymyxin B1-I from the Standard solution

C_S = concentration of USP Polymyxin B Sulfate RS in the Standard solution (mg/mL)

C_U = concentration of Polymyxin B Sulfate in the Sample solution corrected for loss on drying (mg/mL)

P = potency of polymyxin B1-I in USP Polymyxin B Sulfate RS (mg/mg)

Acceptance criteria: See Table 1. Report the components on the dried basis.

Table 1

Name	Relative Retention Time	Acceptance Criteria, (%)
Polymyxin B2 ^a	0.5	—
Polymyxin B3	0.6	NMT 6.0
Polymyxin B1-I	0.8	NMT 15.0
Polymyxin B1 ^a	1.0	—
Sum of polymyxins B1, B2, B3, and B1-I	—	NLT 80.0

^a These components are not reported individually. They are only reported in the sum of polymyxins.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• **LABELING:** Where packaged for prescription compounding, the label states the number of Polymyxin B units in the container and per mg, that it is not intended for manufacturing use, that it is not sterile, and that its potency cannot be assured for longer than 60 days after opening. Where it is intended for use in preparing injectable or other sterile dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable or other sterile dosage forms.

- **USP REFERENCE STANDARDS** (11)
USP Polymyxin B Sulfate RS

Polymyxin B for Injection

» Polymyxin B for Injection contains an amount of Polymyxin B Sulfate equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of polymyxin B.

Change to read:

Packaging and storage—Preserve as described in *Packaging and Storage Requirements* (659), *Injection Packaging, Packaging for constitution* (CN 1-May-2017), protected from light.

Labeling—Label it to indicate that where it is administered intramuscularly and/or intrathecally, it is to be given only to patients hospitalized so as to provide constant supervision by a physician.

USP Reference standards (11)—
USP Polymyxin B Sulfate RS

Constituted solution—At the time of use, it meets the requirements for *Injections and Implanted Drug Products* (1), *Specific Tests, Completeness and clarity of solutions*.

Thin-layer chromatographic identification test (201BNP): meets the requirements.

Pyrogen—It meets the requirements of the *Pyrogen Test* (151), the test dose being 1.0 mL per kg of a solution in pyrogen-free saline TS containing 20,000 Polymyxin B Units per mL.

Sterility Tests (71)—It meets the requirements when tested as directed for *Membrane Filtration under Test for Sterility of the Product to be Examined*.

Particulate Matter in Injections (788): meets the requirements for small-volume injections.

Residue on ignition (281): not more than 5.0%, the charred residue being moistened with 2 mL of nitric acid and 5 drops of sulfuric acid.

Delete the following:

• **Heavy metals, Method II** (231): not more than 0.01%.
• (Official 1-Jan-2018)

Other requirements—It meets the requirements for *pH and Loss on drying under Polymyxin B Sulfate*. It also meets the requirements for *Uniformity of Dosage Units* (905) and *Labeling* (7), *Labels and Labeling for Injectable Products*.

Change to read:

Assay—

Assay preparation 1 (where it is represented as being in a single-dose container)—Constitute Polymyxin B for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and dilute quantitatively with *Buffer B.6* (CN 1-May-2017) to obtain a solution containing a convenient number of Polymyxin B Units per mL.

Assay preparation 2 (where the label states the quantity of polymyxin B in a given volume of constituted solution)—Constitute 1 container of Polymyxin B for Injection in a volume of water, accurately measured, corresponding to the volume of solvent specified in the labeling. Dilute an accu-

ately measured volume of the constituted solution quantitatively with *Buffer B.6* (CN 1-May-2017) to obtain a solution containing a convenient number of Polymyxin B Units per mL.

Procedure—Proceed as directed under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of *Assay preparation* diluted quantitatively with *Buffer B.6* (CN 1-May-2017) to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

Polymyxin B Sulfate and Bacitracin Zinc Topical Aerosol

» Polymyxin B Sulfate and Bacitracin Zinc Topical Aerosol contains the equivalent of not less than 90.0 percent and not more than 130.0 percent of the labeled amounts of polymyxin B and bacitracin.

Packaging and storage—Preserve in pressurized containers, and avoid exposure to excessive heat.

USP Reference standards (11)—

USP Bacitracin Zinc RS
USP Polymyxin B Sulfate RS

Identification—Collect in a suitable container the expelled contents of 1 Aerosol container, shake with a volume of 0.1 N hydrochloric acid sufficient to obtain a solution containing about 500 USP Bacitracin Units per mL, centrifuge, and use the clear supernatant as the test solution. Proceed as directed under *Thin-Layer Chromatographic Identification Test* (201BNP). The specified result is observed.

Microbial enumeration tests (61) and Tests for specified microorganisms (62)—Collect aseptically in a suitable container half the contents expelled from 5 containers, dissolve in 500 mL of *Fluid A* containing 0.25 g of sodium thioglycollate and adjusted with sodium hydroxide to a pH of 6.6 ± 0.6 , pass through a membrane filter as directed for *Membrane Filtration under Test for Sterility of the Product to be Examined under Sterility Tests* (71), except to place the filter on the surface of Soybean-Casein Digest Agar Medium in a Petri dish, incubate for 7 days at 30° to 35°, and count the number of colonies on the filter. Similarly prepare a second specimen, except to incubate at 20° to 25°. Not more than 20 colonies are observed from the two specimens. It meets also the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa* under *Microbial Enumeration Tests* (61) and *Tests for Specified Microorganisms* (62).

Water Determination, Method I (921)—Store 1 container of Topical Aerosol in a freezer for not less than 2 hours, open the container, and transfer 10.0 mL of the freshly mixed specimen to a titration vessel containing 20 mL of a mixture of toluene and methanol (7:3) instead of methanol. In titrating the specimen, determine the endpoint at a temperature of 10° or higher: not more than 0.5% of water is found.

Change to read:

Other requirements—It meets the requirements for *Pressure Test, Minimum Fill, and Leakage Test under Topical Aerosols* (603) (CN 1-May-2017).

Change to read:

Assay for polymyxin B—Proceed as directed for polymyxin B under *Antibiotics—Microbial Assays* (81), expel-

ling the entire contents of 1 container of Topical Aerosol, according to the directions in the labeling, into a 2000-mL conical flask held in a horizontal position. Add 500.0 mL of 0.01 N hydrochloric acid, and shake to dissolve. Immediately dilute an accurately measured volume of this acidic solution quantitatively and stepwise with **Buffer B.6** (CN 1-May-2017) to obtain a *Test Dilution* having a concentration of polymyxin B assumed to be equal to the median dose level of the Standard.

Change to read:

Assay for bacitracin—Proceed as directed for bacitracin under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of the acidic solution obtained in the *Assay for polymyxin B* immediately diluted quantitatively and stepwise with **Buffer B.1** (CN 1-May-2017) to yield a *Test Dilution* having a bacitracin concentration assumed to be equal to the median dose level of the Standard. [NOTE—Add additional hydrochloric acid to each test dilution of the Standard to obtain the same concentration of hydrochloric acid as in the *Test Dilution*.]

Polymyxin B Sulfate and Bacitracin Zinc Topical Powder

» Polymyxin B Sulfate and Bacitracin Zinc Topical Powder contains not less than 90.0 percent and not more than 130.0 percent of the labeled amounts of polymyxin B and bacitracin.

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Bacitracin Zinc RS

USP Polymyxin B Sulfate RS

Microbial enumeration tests (61) and **Tests for specified microorganisms** (62)—Collect aseptically in a suitable container about 1 g from not less than 5 containers, dissolve in 500 mL of *Fluid A*, filter through a membrane filter as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined* under *Sterility Tests* (71), except to place the filter on the surface of Soybean-Casein Digest Agar Medium in a Petri dish, incubate for 7 days at 30° to 35°, and count the number of colonies on the filter. Similarly prepare a second specimen, except to incubate at 20° to 25°. Not more than 20 colonies are observed from the two specimens. It meets also the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa* under *Microbial Enumeration Tests* (61) and *Tests for specified microorganisms* (62).

Water Determination, Method I (921): not more than 7.0%.

Change to read:

Assay for polymyxin B—Proceed as directed for polymyxin B under *Antibiotics—Microbial Assays* (81), using an accurately weighed portion of Topical Powder, equivalent to about 5000 USP Polymyxin B Units, shaken with 20 mL of water in a suitable volumetric flask. Dilute with **Buffer B.6** (CN 1-May-2017) to volume, and mix. Dilute an accurately measured volume of the solution so obtained quantitatively with **Buffer B.6** (CN 1-May-2017) to obtain a *Test Dilution* having a concentration of polymyxin B assumed to be equal to the median dose level of the Standard.

Change to read:

Assay for bacitracin—Proceed as directed for bacitracin under *Antibiotics—Microbial Assays* (81), using an accurately weighed portion of Topical Powder, equivalent to about 800 USP Bacitracin Units, added to a 100-mL volumetric flask, dilute with 0.01 N hydrochloric acid to volume, and mix. Dilute this solution quantitatively with **Buffer B.1** (CN 1-May-2017) to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard. In preparing each test dilution of the Standard, add additional hydrochloric acid to each to obtain the same concentration of hydrochloric acid as in the *Test Dilution*.

Polymyxin B Sulfate and Hydrocortisone Otic Solution

» Polymyxin B Sulfate and Hydrocortisone Otic Solution is a sterile solution containing not less than 90.0 percent and not more than 130.0 percent of the labeled amount of polymyxin B, and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hydrocortisone (C₂₁H₃₀O₅). It may contain one or more suitable buffers and preservatives.

NOTE—Where Polymyxin B Sulfate and Hydrocortisone Otic Solution is prescribed without reference to the quantity of polymyxin B or hydrocortisone contained therein, a product containing 10,000 Polymyxin B Units and 5 mg of hydrocortisone per mL shall be dispensed.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Hydrocortisone RS

USP Polymyxin B Sulfate RS

Sterility Tests (71): meets the requirements.

pH (791): between 3.0 and 5.0.

Change to read:

Assay for polymyxin—Proceed with Otic Solution as directed under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of Otic Solution diluted quantitatively with **Buffer B.6** (CN 1-May-2017) to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

Assay for hydrocortisone—

Mobile phase—Prepare a suitable solution of about 500 volumes of methanol, 500 volumes of water, and 1 volume of glacial acetic acid, such that the retention time of hydrocortisone is between 6 and 10 minutes.

Standard preparation—Dissolve a suitable quantity of USP Hydrocortisone RS, accurately weighed, in a mixture of methanol and water (1:1) to obtain a solution having a known concentration of about 0.15 mg per mL.

Assay preparation—Transfer an accurately measured volume of Otic Solution, equivalent to about 15 mg of hydrocortisone, to a 100-mL volumetric flask, dilute with a mixture of methanol and water (1:1) to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph five replicate

injections of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph by means of a suitable microsyringe or sampling valve, adjusting the specimen size and other operating parameters such that the peak obtained from the *Standard preparation* is about 0.6 full-scale. Record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{21}H_{30}O_5$ in each mL of the Otic Solution taken by the formula:

$$(100C / V)(H_U / H_S)$$

in which *C* is the concentration, in mg per mL, of USP Hydrocortisone RS in the *Standard preparation*, *V* is the volume, in mL, of the portion of Otic Solution taken, and H_U and H_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Polymyxin B Sulfate and Trimethoprim Ophthalmic Solution

» Polymyxin B Sulfate and Trimethoprim Ophthalmic Solution is a sterile, isotonic, aqueous solution of Polymyxin B Sulfate and Trimethoprim Sulfate or of Polymyxin B Sulfate and Trimethoprim that has been solubilized with Sulfuric Acid. It contains not less than 90.0 percent and not more than 130.0 percent of the labeled amount of polymyxin B and the equivalent of not less than 90.0 percent and not more than 110.0 percent of the labeled amount of trimethoprim ($C_{14}H_{18}N_4O_3$). It contains one or more preservatives.

Packaging and storage—Preserve in tight, light-resistant containers, and store at controlled room temperature.

Labeling—Label it to indicate that it is to be stored at 15° to 25°, protected from light.

USP Reference standards (11)—

USP Polymyxin B Sulfate RS

USP Trimethoprim RS

Identification—

A: It meets the requirements for polymyxin B under *Thin-Layer Chromatographic Identification Test* (201BNP).

B: The retention time of the trimethoprim peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for trimethoprim*.

Sterility Tests (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

pH (791): between 4.0 and 6.2.

Change to read:

Assay for polymyxin B—Proceed as directed for polymyxin B under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of Ophthalmic Solution, diluted quantitatively and stepwise with *Buffer B.6* (CN 1-May-2017), to obtain a *Test Dilution* having a concentration of polymyxin B assumed to be equal to the median dose level of the Standard.

Assay for trimethoprim—

Diluent—Prepare a mixture of 0.01 N hydrochloric acid and acetonitrile (870:130).

Mobile phase—Dissolve 1.65 g of ethanesulfonic acid in 1000 mL of a mixture of water and acetonitrile (870:130). Adjust with 10 N sodium hydroxide or 0.1 N hydrochloric acid to a pH of 3.5. Pass this solution through a filter having a 0.5- μ m or finer porosity, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Dissolve an accurately weighed quantity of USP Trimethoprim RS in *Diluent* to obtain a solution having a known concentration of about 0.04 mg per mL.

Assay preparation—Transfer an accurately measured volume of Ophthalmic Solution, equivalent to about 1 mg of trimethoprim, to a 25-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm \times 30-cm column that contains packing L11. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 1.5, when calculated at 10% height of the peak; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of trimethoprim ($C_{14}H_{18}N_4O_3$) in each mL of the Ophthalmic Solution taken by the formula:

$$25(C/V)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Trimethoprim RS in the *Standard preparation*; *V* is the volume, in mL, of Ophthalmic Solution taken to prepare the *Assay preparation*; and r_U and r_S are the trimethoprim peak area responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Polyvinyl Alcohol

(C_2H_4O)_n

Ethanol, homopolymer;

Vinyl alcohol polymer [9002-89-5].

DEFINITION

Polyvinyl Alcohol is a water-soluble synthetic resin, represented by the formula (C_2H_4O)_n, in which the average value of *n* lies between 500 and 5000. It is prepared by 85%–89% hydrolysis of polyvinyl acetate. The apparent viscosity, in mPa · s, at 20°, of a 4% (w/w) aqueous solution is NLT 85.0% and NMT 115.0% of that stated on the label.

IDENTIFICATION

• **A. INFRARED ABSORPTION** (197K)

• **B.** It meets the requirements in the test *Viscosity—Capillary Methods* (911), *Viscosity—Rotational Methods* (912), and *Viscosity—Rolling Ball Method* (913).

• **C.**

Sample solution: Dissolve 0.5 g of Polyvinyl Alcohol in 10 mL of water, with heat if necessary, and let the solution cool to room temperature.

Analysis 1: Transfer 5 mL of the *Sample solution* to a test tube, add 1 drop of iodine TS, mix, and allow to stand.

Acceptance criteria 1: A dark red to blue color is produced.

Analysis 2: Transfer 2 mL of the remaining *Sample solution* to a test tube, add 10 mL of Alcohol, and mix.

Acceptance criteria 2: A white, turbid, or flocculent precipitate is formed.

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 1.0%

Delete the following:

- **HEAVY METALS, Method II** (231): NMT 10 µg/g • (Official 1-Jan-2018)

WATER-INSOLUBLE SUBSTANCES

Analysis: Wash the tared 100-mesh screen used in the test for Viscosity immediately after with two 25-mL portions of water, and dry at 110° for 1 h.

Acceptance criteria: NMT 6.4 mg of water-insoluble substances are found (corresponding to NMT 0.1%).

LIMIT OF METHANOL (METHYL ALCOHOL) AND METHYL ACETATE

Standard solution: In a 100-mL screw-cap bottle, prepare a 100-mL solution containing 0.24 µL/mL of USP Methyl Alcohol RS and 0.24 µL/mL of USP Methyl Acetate RS. Add 30 µL of USP Acetone RS to the screw-cap bottle. Close the bottle tightly with the screw cap, and heat it in a water bath, stirring continuously. Remove the bottle from the water bath, and allow it to cool to room temperature.

Sample solution: Transfer a quantity of Polyvinyl Alcohol, equivalent to 2.0 g on the dried basis, to a 100-mL screw-cap bottle, and add a magnetic stirrer. Add 98 mL of water and 30 µL of USP Acetone RS. Close the bottle tightly with the screw cap, and heat it in a water bath, stirring continuously. Once the solution becomes clear, remove the bottle from the water bath, and allow it to cool to room temperature.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: GC

Detector: Flame ionization

Column: 3.2-mm × 2-m glass, phase S3

Temperatures

Injection port: 160°

Column: 160°

Detector: 160°

Carrier gas: Nitrogen

Flow rate: 30 mL/min

Injection volume: 0.4 µL

System suitability

Sample: Standard solution

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: Standard solution and Sample solution

Calculate the percentages of methanol and methyl acetate in the portion of Polyvinyl Alcohol taken:

$$\text{Result} = (R_U/R_S) \times (C_S/W) \times V \times D \times F \times 100$$

R_U = peak response ratio of the methanol or methyl acetate peak relative to the acetone peak from the *Sample solution*

R_S = peak response ratio of the methanol or methyl acetate peak relative to the acetone peak from the *Standard solution*

C_S = concentration of methanol (methyl alcohol) or methyl acetate in the *Standard solution* (µL/mL)

W = weight of Polyvinyl Alcohol on the dried basis taken to prepare the *Sample solution* (g)

V = volume of the *Sample solution*, 100 mL

D = density of methanol (methyl alcohol) or methyl acetate, 0.79 and 0.93 g/mL, respectively

F = conversion factor, 10^{-3} mL/µL

Acceptance criteria

Methanol (methyl alcohol): NMT 1.0%

Methyl acetate: NMT 1.0%

SPECIFIC TESTS

• LOSS ON DRYING (731)

Analysis: Dry at 110° to constant weight.

Acceptance criteria: NMT 5.0%

• VISCOSITY—CAPILLARY METHODS (911), VISCOSITY—ROTATIONAL METHODS (912), or VISCOSITY—ROLLING BALL METHOD (913)

Sample: After performing *Loss on Drying*, weigh undried Polyvinyl Alcohol, equivalent to 6.00 g on the dried basis.

Analysis: Over a period of seconds, transfer the *Sample* with continuous slow stirring to 140 mL of water contained in a suitable tared flask. When the specimen is well wetted, increase the rate of stirring, avoiding mixing in excess air. Heat the mixture to 90°, and maintain the temperature at 90° for about 5 min. Discontinue heating, and continue stirring for 1 h. Add water to make the mixture weigh 150 g. Resume stirring to obtain a homogeneous solution. Filter the solution through a tared 100-mesh screen into a 250-mL conical flask, cool the filtrate to 15°, mix, and proceed as directed in the chapter. Determine its viscosity at $20 \pm 0.1^\circ$, using an appropriate viscometer.

Acceptance criteria: 85.0%–115.0% of the labeled value.

• PH (791)

Sample solution: 40 mg/mL

Acceptance criteria: 5.0–8.0

• DEGREE OF HYDROLYSIS

Sample: 1 g of Polyvinyl Alcohol, previously dried at 110° to constant weight

Analysis: Transfer the *Sample* to a wide-mouth, 250-mL conical flask fitted by means of a suitable glass joint to a reflux condenser. Add 35 mL of dilute methanol (3 in 5), and mix gently to ensure complete wetting of the solid. Add 3 drops of phenolphthalein TS, and add 0.2 N hydrochloric acid or 0.2 N sodium hydroxide if necessary, to neutralize. Add 25.0 mL of 0.2 N sodium hydroxide VS, and reflux gently on a hot plate for 1 h. Wash the condenser with 10 mL of water, collecting the washings in the flask, cool, and titrate with 0.2 N hydrochloric acid VS. Concomitantly perform a blank determination in the same manner, using the same quantity of 0.2 N sodium hydroxide VS.

Calculation of saponification value: Calculate the saponification value:

$$\text{Result} = [(V_B - V_S) \times N \times M_r] / W$$

V_B = volume of 0.2 N hydrochloric acid VS consumed in the titration of the blank (mL)

V_S = volume of 0.2 N hydrochloric acid VS consumed in the titration of the *Sample solution* (mL)

N = actual normality of hydrochloric acid VS

M_r = molecular weight of potassium hydroxide, 56.11

W = weight of the portion of Polyvinyl Alcohol taken (g)

Calculation of degree of hydrolysis: Calculate the degree of hydrolysis, expressed as a percentage of hydrolysis of polyvinyl acetate:

$$\text{Result} = 100 - [7.84 \times S / (100 - 0.075 \times S)]$$

S = saponification value of the Polyvinyl Alcohol
Acceptance criteria: 85%–89%

• ACID VALUE

Sample: 10.0 g

Analysis: Add 200 mL of water to a borosilicate round-bottom flask attached to a reflux condenser. Heat the water on a water bath with constant stirring. Add the Sample to the water, and continue heating for 30 min with continuous stirring. Remove the flask from the water bath, and continue stirring until room temperature is reached. Quantitatively transfer this solution to a 250-mL volumetric flask, dilute with water to volume, and mix. Add 0.5 mL of phenolphthalein TS to 50 mL of this solution, and titrate with 0.05 N potassium hydroxide VS until the pink color persists for 15 s. Calculate the acid value:

$$\text{Result} = D \times M_r \times [(N \times V)/W]$$

D = dilution factor

M_r = molecular weight of potassium hydroxide, 56.11

N = normality of potassium hydroxide VS used

V = volume of 0.05 N potassium hydroxide used (mL)

W = weight of the Sample (g)

Acceptance criteria: NMT 3.0

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at room temperature in a dry place.
- **LABELING:** Label it to indicate the viscosity, giving the viscosity measurement parameters, the concentration of the solution, and the type of equipment used.
- **USP REFERENCE STANDARDS (11)**
 - USP Acetone RS
 - USP Methyl Acetate RS
 - USP Methyl Alcohol RS
 - USP Polyvinyl Alcohol RS

Sulfurated Potash

Thiosulfuric acid, dipotassium salt, mixture with potassium sulfide (K_2S_x).

Dipotassium thiosulfate mixture with potassium sulfide (K_2S_x) [39365-88-3].

» Sulfurated Potash is a mixture composed chiefly of potassium polysulfides and potassium thiosulfate. It contains not less than 12.8 percent of sulfur (S) in combination as sulfide.

Packaging and storage—Preserve in tight containers. Containers from which it is to be taken for immediate use in compounding prescriptions contain not more than 120 g.

Identification—

A: To a 1 in 10 solution add an excess of 6 N acetic acid: hydrogen sulfide is evolved, and sulfur is precipitated.

B: Filter the mixture from Identification test A, and add to the filtrate an excess of sodium bitartrate TS: an abundant, white, crystalline precipitate is formed within 15 minutes.

Assay for sulfides—Transfer 10 to 15 pieces of Sulfurated Potash to a mortar, and reduce to a fine powder. Transfer about 1 g of the powder, accurately weighed, to a 250-mL beaker, and dissolve in 50 mL of water. Filter, if necessary, and wash or dilute with water to 75 mL. Add, with constant stirring, 50 mL of cupric sulfate solution (1 in 20), and allow the mixture to stand, with occasional stirring, for 10 minutes. Filter through a retentive filter, and wash the precipitate with 200 mL of 0.25 N hydrochloric acid, taking care to avoid breaking up the cake. (If the filtrate is not blue in

color, discard the assay specimen, and start over, using a larger volume of cupric sulfate solution.) Ignite the precipitate in a tared dish at 1000° for 1 hour, cool in a desiccator, and weigh: the weight of the cupric oxide so obtained, multiplied by 0.4030, represents the weight of S in the specimen under assay.

Potassium Acetate

$\text{C}_2\text{H}_3\text{KO}_2$

98.14

Acetic acid, potassium salt;
Potassium acetate [127-08-2].

DEFINITION

Potassium Acetate contains NLT 99.0% and NMT 100.5% of $\text{C}_2\text{H}_3\text{KO}_2$, calculated on the dried basis.

IDENTIFICATION

• A. IDENTIFICATION TESTS—GENERAL, Potassium (191)

Sample solution: 100 mg/mL

Acceptance criteria: Meets the requirements

• B. IDENTIFICATION TESTS—GENERAL, Acetate (191)

Sample solution: 100 mg/mL

Acceptance criteria: Meets the requirements

ASSAY

• PROCEDURE

Sample: 200 mg of Potassium Acetate, previously dried

Analysis: Dissolve the Sample in 25 mL of glacial acetic acid, add 2 drops of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a green endpoint. Perform a blank determination, and make any necessary correction (see *Titrimetry* (541)). Each mL of 0.1 N perchloric acid is equivalent to 9.814 mg of potassium acetate ($\text{C}_2\text{H}_3\text{KO}_2$).

Acceptance criteria: 99.0%–100.5% on the dried basis

IMPURITIES

Delete the following:

• HEAVY METALS, Method I (231)

Test preparation: Dissolve 1 g of Potassium Acetate in 10 mL of water, add 3.0 mL of glacial acetic acid, and dilute with water to 25 mL. Adjust with glacial acetic acid to a pH of 3.8–4.0, measured with a pH meter.

Monitor preparation: Prepare as directed for the Test preparation, 2.0 mL of Standard Lead Solution being added.

Acceptance criteria: NMT 20 ppm (Official 1-Jan-2018)

• LIMIT OF SODIUM

Solution A: 100 mg/mL of potassium chloride in water
Standard stock solution: Transfer 127.1 mg of sodium chloride, previously dried at 105° for 2 h into a 500-mL volumetric flask, add water to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix.

Standard solutions: Transfer 2.0, 5.0, and 10.0 mL of the Standard stock solution into separate 100-mL volumetric flasks, add 10.0 mL of Solution A to each flask, and dilute with water to volume. These Standard solutions contain 0.2, 0.5, and 1.0 µg/mL of sodium, respectively. [NOTE—Concentrations of sodium in the Standard solutions may be modified to fit the linear or working range of the atomic absorption spectrophotometer.]

Sample solution: Transfer about 0.2 g of Potassium Acetate into a 100-mL volumetric flask containing about

50 mL of water, and swirl to dissolve. Add 10.0 mL of *Solution A*, dilute with water to volume, and mix.

[NOTE—The concentration of Potassium Acetate in the *Sample solution* may be modified by using a different quantity or by further dilution to bring the absorption response within the range of responses from the *Standard solutions*.]

Instrumental conditions

(See *Atomic Absorption Spectroscopy* (852).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Sodium emission line at 589 nm

Lamp: Sodium hollow-cathode

Flame: Oxidizing air-acetylene

Blank solution: Transfer 10.0 mL of *Solution A* into a 100-mL volumetric flask, dilute with water to volume, and mix.

Analysis

Samples: *Standard solutions*, *Sample solution*, and *Blank solution*

Determine the absorbances of the *Standard solutions* and the *Sample solution*, using the *Blank solution* to zero the instrument. Plot the absorbances of the *Standard solutions* versus the concentration, in $\mu\text{g/mL}$, of sodium, and draw the straight line best fitting the plotted points. From the graph so obtained, determine the concentration, C , in $\mu\text{g/mL}$, of sodium in the *Sample solution*.

Calculate the percentage of sodium in the portion of Potassium Acetate taken:

$$\text{Result} = (C/W) \times (V/F) \times 100$$

C = concentration of the *Sample solution*, determined from the graph ($\mu\text{g/mL}$)

W = weight of Potassium Acetate taken to prepare the *Sample solution* (g)

V = final volume of the *Sample solution*, taking into account any dilution necessary (mL)

F = conversion factor (1,000,000 $\mu\text{g/g}$)

Acceptance criteria: NMT 0.03%

SPECIFIC TESTS

• pH (791)

Sample solution: 50 mg/mL

Acceptance criteria: 7.5–8.5

• LOSS ON DRYING (731):

Dry a sample at 150° for 2 h: it loses NMT 1.0% of its weight.

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE:

Preserve in tight containers.

Potassium Acetate Injection

» Potassium Acetate Injection is a sterile solution of Potassium Acetate in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $\text{C}_2\text{H}_3\text{KO}_2$.

Packaging and storage—Preserve in single-dose or in multiple-dose containers, preferably of Type I or Type II glass.

Labeling—The label states the potassium acetate content in terms of weight and of milliequivalents in a given volume. Label the Injection to indicate that it is to be diluted to appropriate strength with water or other suitable fluid prior to administration. The label states also the total osmolar concentration in mOsmol per L. Where the contents are less than 100 mL, or where the label states that the Injection is not for direct injection but is to be diluted before

use, the label alternatively may state the total osmolar concentration in mOsmol per mL.

USP Reference standards (11)—

USP Endotoxin RS

Identification—It responds to the tests for *Potassium* (191) and for *Acetate* (191).

Bacterial Endotoxins Test (85)—It contains not more than 8.80 USP Endotoxin Units per mEq.

pH (791): between 5.5 and 8.0, when diluted with water to 1.0% of potassium acetate.

Particulate Matter in Injections (788): meets the requirements under small-volume injections.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—

Potassium stock solution—Dissolve 190.7 mg of potassium chloride, previously dried at 105° for 2 hours, in water. Transfer to a 1000-mL volumetric flask, dilute with water to volume, and mix. Transfer 100.0 mL of this solution to a 1000-mL volumetric flask, dilute with water to volume, and mix. This solution contains 10 μg of potassium (equivalent to 19.07 μg of potassium chloride) per mL.

Standard preparations—To separate 100-mL volumetric flasks transfer 10.0, 15.0, and 20.0 mL, respectively, of *Potassium stock solution*. To each flask add 2.0 mL of sodium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, dilute with water to volume, and mix. The *Standard preparations* contain, respectively, 1.0, 1.5, and 2.0 μg of potassium per mL.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 2 g of potassium acetate, to a 500-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of the solution to a 250-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of the resulting solution to a 100-mL volumetric flask, add 2.0 mL of sodium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, dilute with water to volume, and mix.

Procedure—Concomitantly determine the absorbances of the *Standard preparations* and the *Assay preparation* at the potassium emission line of 766.5 nm, with a suitable atomic absorption spectrophotometer (see *Atomic Absorption Spectroscopy* (852)) equipped with a potassium hollow-cathode lamp and an air-acetylene flame, using water as the blank. Plot the absorbance of the *Standard preparation* versus concentration, in μg per mL, of potassium, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, in μg per mL, of potassium in the *Assay preparation*. Calculate the quantity, in mg, of $\text{C}_2\text{H}_3\text{KO}_2$ in the portion of Injection taken by the formula:

$$500C(2.510)$$

in which C is the concentration, in μg per mL, of potassium in the *Assay preparation*, and 2.510 is the ratio of the molecular weight of potassium acetate to the atomic weight of potassium.

Potassium Bicarbonate

KHCO_3

100.12

Carbonic acid, monopotassium salt;
Monopotassium carbonate [298-14-6].

DEFINITION

Potassium Bicarbonate contains NLT 99.5% and NMT 101.5% of KHCO_3 , calculated on the dried basis.

IDENTIFICATION• **A. IDENTIFICATION TESTS—GENERAL, Potassium (191)**

Sample solution: 100 mg/mL

Acceptance criteria: Meets the requirements

• **B. IDENTIFICATION TESTS—GENERAL, Bicarbonate (191)**

Sample solution: 100 mg/mL

Acceptance criteria: Meets the requirements

ASSAY• **PROCEDURE**

Sample: 4 g

Analysis: Dissolve the Sample in 100 mL of water, add methyl red TS, and titrate with 1 N hydrochloric acid VS. Add the acid slowly, with constant stirring, until the solution becomes faintly pink. Heat the solution to boiling, cool, and continue the titration until the pink color no longer fades after boiling. Each mL of 1 N hydrochloric acid is equivalent to 100.1 mg of KHCO_3 .

Acceptance criteria: 99.5%–101.5% on the dried basis

IMPURITIES**Delete the following:**• **HEAVY METALS, Method I (231)**

Sample solution: To 2 g add 5 mL of water and 8 mL of 3 N hydrochloric acid, heat to boiling, and maintain that temperature for 1 min. Add 1 drop of phenolphthalein TS and sufficient 6 N ammonium hydroxide, dropwise, to give the solution a faint pink color. Cool, add 2 mL of 1 N acetic acid, and then dilute with water to 25 mL.

Acceptance criteria: NMT 10 ppm (Official 1-Jan-2018)

SPECIFIC TESTS• **LOSS ON DRYING (731):** Dry a sample over silica gel for 4 h: it loses NMT 0.3% of its weight.• **NORMAL CARBONATE**

Sample: Grind 3.0 g of Potassium Bicarbonate with 25 mL of alcohol and 5 mL of water in a porcelain mortar.

Barium chloride solution: 12.216 mg/mL of barium chloride in alcohol and water (7:3), prepared by dissolving the barium chloride in water, then diluting with alcohol to final volume

Analysis: Add 3 drops of phenolphthalein TS to the Sample, and titrate slowly with Barium chloride solution until the suspension becomes colorless. Continue the grinding for 2 min, and if the color turns pink, continue the titration with Barium chloride solution to a colorless endpoint. Repeat the grinding for 2 min and the addition of Barium chloride solution, if necessary, until the suspension is colorless after 2 min of grinding. Each mL of the barium chloride solution is equivalent to 6.911 mg of K_2CO_3 .

Acceptance criteria: NMT 2.5%

ADDITIONAL REQUIREMENTS• **PACKAGING AND STORAGE:** Preserve in well-closed containers.**Potassium Bicarbonate Effervescent Tablets for Oral Solution**

» Potassium Bicarbonate Effervescent Tablets for Oral Solution contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of K.

Packaging and storage—Preserve in tight containers, protected from excessive heat.

Labeling—The label states the potassium content in terms of weight and in terms of milliequivalents. Where the Tablets are packaged in individual pouches, the label instructs the user not to open until the time of use.

Identification—One Tablet dissolves in 100 mL of water with effervescence. The collected gas responds to the test for Bicarbonate (191), and the resulting solution responds to the test for Potassium (191).

Uniformity of dosage units (905): meet the requirements.

Assay—

Standard stock solution and Standard solutions—Prepare as directed in the Assay under Potassium Chloride Oral Solution.

Assay preparation—Transfer 10 Tablets to a 2000-mL volumetric flask, dissolve in 200 mL of water, swirl until effervescence ceases, dilute with water to volume, and mix. Filter, and quantitatively dilute an accurately measured volume of the filtrate with water to obtain a solution containing 30 µg of potassium per mL. Transfer 5.0 mL of the resulting solution to a 100-mL volumetric flask, add 2.0 mL of sodium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, dilute with water to volume, and mix.

Procedure—Proceed as directed for Instrumental conditions and Analysis in the Assay under Potassium Chloride Oral Solution, except use Assay preparation instead of Sample solution. Calculate the quantity, in mg, of K in each Tablet taken by the formula:

$$L(C/D)$$

in which *L* is the labeled quantity, in mg, of potassium in each Tablet, *C* is the concentration, in µg per mL, of potassium in the Assay preparation, and *D* is the concentration, in µg per mL, of potassium in the Assay preparation on the basis of the labeled quantity in each Tablet and the extent of dilution.

Potassium Bicarbonate and Potassium Chloride for Effervescent Oral Solution

» Potassium Bicarbonate and Potassium Chloride for Effervescent Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of K and Cl.

Packaging and storage—Preserve in tight containers, protected from excessive heat.

Labeling—The label states the potassium and chloride contents in terms of weight and in terms of milliequivalents. Where packaged in individual pouches, the label instructs the user not to open until the time of use.

Identification—A 3-g portion dissolves in 100 mL of water with effervescence. The collected gas so obtained responds to the test for Bicarbonate (191), and the resulting solution responds to the tests for Potassium (191) and for Chloride (191).

Minimum fill (755)—

FOR SOLID PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

Uniformity of dosage units (905)—

FOR SOLID PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

Assay for potassium—

Standard stock solution and Standard solutions—Prepare as directed in the Assay under Potassium Chloride Oral Solution.

Assay preparation—Weigh and mix the contents of not less than 20 containers of Potassium Bicarbonate and Potassium Chloride for Effervescent Oral Solution. Transfer an accurately weighed portion of the powder, equivalent to about 6 g of potassium, to a 1000-mL volumetric flask, dissolve in about 200 mL of water, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a second 1000-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of the resulting solution to a 100-mL volumetric flask, add 2.0 mL of sodium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, dilute with water to volume, and mix.

Procedure—Proceed as directed for *Instrumental conditions* and *Analysis* in the *Assay* under *Potassium Chloride Oral Solution*, except use *Assay preparation* instead of *Sample solution*. Calculate the quantity, in mg, of K in the portion of Potassium Bicarbonate and Potassium Chloride for Effervescent Oral Solution taken by the formula:

$$400C$$

in which *C* is the concentration, in μg per mL, of potassium in the *Assay preparation*.

Assay for chloride—Weigh and mix the contents of not less than 20 containers of Potassium Bicarbonate and Potassium Chloride for Effervescent Oral Solution. Transfer a portion of the powder, equivalent to about 900 mg of chloride, to a 2000-mL volumetric flask. Add about 200 mL of water, swirl until effervescence ceases, dilute with water to volume, and mix. Transfer 25.0 mL of this solution to a 250-mL conical flask, add 50.0 mL of 0.1 N silver nitrate VS and 15 mL of nitric acid, and boil, with constant swirling, until the solution is colorless. Cool to room temperature, add water to make about 150 mL, then add 5 mL of ferric ammonium sulfate TS, and titrate the excess silver nitrate with 0.1 N ammonium thiocyanate VS to a permanent faint brown endpoint. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of Cl.

Potassium Bicarbonate and Potassium Chloride Effervescent Tablets for Oral Solution

» Potassium Bicarbonate and Potassium Chloride Effervescent Tablets for Oral Solution contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of K and Cl.

Packaging and storage—Preserve in tight containers, protected from excessive heat.

Labeling—The label states the potassium and chloride contents in terms of weight and in terms of milliequivalents. Where the Tablets are packaged in individual pouches, the label instructs the user not to open until the time of use.

Identification—One Tablet dissolves in 100 mL of water with effervescence. The collected gas responds to the test for Bicarbonate (191), and the resulting solution responds to the tests for Potassium (191) and for Chloride (191).

Uniformity of dosage units (905): meet the requirements.

Assay for potassium—

Standard stock solution and Standard solutions—Prepare as directed in the *Assay* under *Potassium Chloride Oral Solution*.

Assay preparation—Transfer 10 Tablets to a 2000-mL volumetric flask, dissolve in 200 mL of water, swirl until effervescence ceases, dilute with water to volume, and mix. Filter, and quantitatively dilute an accurately measured volume of

the filtrate with water to obtain a solution containing 30 μg of potassium per mL. Transfer 5.0 mL of the resulting solution to a 100-mL volumetric flask, add 2.0 mL of sodium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, dilute with water to volume, and mix.

Procedure—Proceed as directed for *Instrumental conditions* and *Analysis* in the *Assay* under *Potassium Chloride Oral Solution*, except use *Assay preparation* instead of *Sample solution*. Calculate the quantity, in mg, of K in each Tablet taken by the formula:

$$L(C/D)$$

in which *L* is the labeled quantity, in mg, of potassium in each Tablet, *C* is the concentration, in μg per mL, of potassium in the *Assay preparation*, and *D* is the concentration, in μg per mL, of potassium in the *Assay preparation* on the basis of the labeled quantity in each Tablet and the extent of dilution.

Assay for chloride—Transfer a number of Tablets, equivalent to about 900 mg of chloride, to a 2000-mL volumetric flask. Add about 200 mL of water, swirl until effervescence ceases, dilute with water to volume, and mix. Transfer 25.0 mL of this solution to a 250-mL conical flask, add 50.0 mL of 0.1 N silver nitrate VS and 15 mL of nitric acid, and boil, with constant swirling, until the supernatant is colorless. Cool to room temperature, add sufficient water to make a volume of about 150 mL, add 5 mL of ferric ammonium sulfate TS, and titrate the excess silver nitrate with 0.1 N ammonium thiocyanate VS to a permanent faint brown endpoint. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of Cl. Calculate the quantity, in mg, of chloride (Cl) in each Tablet by dividing the total amount of chloride in the Tablets taken by the number of Tablets taken.

Potassium and Sodium Bicarbonates and Citric Acid Effervescent Tablets for Oral Solution

DEFINITION

Potassium and Sodium Bicarbonates and Citric Acid Effervescent Tablets for Oral Solution contain NLT 90.0% and NMT 110.0% of the labeled amounts of potassium bicarbonate (KHCO_3), sodium bicarbonate (NaHCO_3), and anhydrous citric acid ($\text{C}_6\text{H}_8\text{O}_7$).

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL**, Bicarbonate (191), Potassium (191), Sodium (191), and Citrate (191)

Sample: One Tablet for Oral Solution

Analysis 1: Dissolve the sample in 100 mL of water, and collect the gas that evolves.

Acceptance criteria 1: The *Sample* effervesces when dissolved.

Analysis 2: Proceed as directed in *Bicarbonate* (191) on the gas collected from *Analysis 1*.

Acceptance criteria 2: Meets the requirements

Analysis 3: Proceed as directed in *Potassium* (191) and *Sodium* (191) on the resulting solution from *Analysis 1*.

Acceptance criteria 3: Meets the requirements

Analysis 4: Proceed as directed in *Citrate* (191) on 3–5 drops of the resulting solution from *Analysis 1* and 20 mL of the mixture of pyridine and acetic anhydride.

Acceptance criteria 4: Meets the requirements

ASSAY

- **POTASSIUM BICARBONATE AND SODIUM BICARBONATE**

Potassium chloride stock solution: 7.5 mg/mL of potassium chloride, previously dried at 125° for 30 min, in water

Sodium chloride stock solution: 7 mg/mL of sodium chloride, previously dried at 125° for 30 min, in water
Diluent: 1.04 mg/mL of lithium nitrate prepared as follows. Transfer 1.04 g of lithium nitrate to a 1000-mL volumetric flask. Before dilution to final volume, add a suitable nonionic surfactant.

Standard stock solution: 0.75 mg/mL of potassium chloride and 0.7 mg/mL of sodium chloride in water from *Potassium chloride stock solution* and *Sodium chloride stock solution*, respectively

Standard solution: 0.0375 mg/mL of potassium chloride and 0.035 mg/mL of sodium chloride in *Diluent* from the *Standard stock solution*

Sample stock solution A: Nominally 3 mg/mL of potassium bicarbonate prepared as follows. Finely powder NLT 20 Tablets for Oral Solution. Tablets for Oral Solution and powder are hygroscopic. After removal from the container, grind the Tablets for Oral Solution promptly in an atmosphere of low relative humidity, and weigh the powder promptly. Transfer a portion of the powder, equivalent to about 3000 mg of potassium bicarbonate, to a 1000-mL volumetric flask. Dissolve in 500 mL of water, swirl until effervescence ceases, and dilute with water to volume.

Sample stock solution B: Nominally 1 mg/mL of potassium bicarbonate, based on the labeled quantity, from *Sample stock solution A* in water

Sample stock solution C: Nominally 1 mg/mL of sodium bicarbonate, based on the labeled quantity, from *Sample stock solution A* in water

Sample solution A: Nominally 0.05 mg/mL of potassium bicarbonate from *Sample stock solution B* in *Diluent*

Sample solution B: Nominally 0.05 mg/mL of sodium bicarbonate from *Sample stock solution C* in *Diluent*

Instrumental conditions

Mode: Flame photometer

Analytical wavelengths

Potassium: The maximum at about 766 nm

Sodium: The maximum at about 589 nm

Blank: *Diluent*

Analysis

Samples: *Standard solution*, *Sample solution A*, *Sample solution B*, and *Blank*

Use the *Blank* to zero the instrument. Measure the emission responses for the *Standard solution*, *Sample solution A*, and *Sample solution B*.

Calculate the percentage of the labeled amount of potassium bicarbonate (KHCO₃) in the portion of Tablets for Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = photometer reading of potassium from *Sample solution A*

r_S = photometer reading of potassium from the *Standard solution*

C_S = concentration of potassium chloride in the *Standard solution* (mg/mL)

C_U = nominal concentration of potassium bicarbonate in *Sample solution A* (mg/mL)

M_{r1} = molecular weight of potassium bicarbonate, 100.12

M_{r2} = molecular weight of potassium chloride, 74.55
 Calculate the percentage of the labeled amount of sodium bicarbonate (NaHCO₃) in the portion of Tablets for Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = photometer reading of sodium from *Sample solution B*

r_S = photometer reading of sodium from the *Standard solution*

C_S = concentration of sodium chloride in the *Standard solution* (mg/mL)

C_U = nominal concentration of sodium bicarbonate in *Sample solution B* (mg/mL)

M_{r1} = molecular weight of sodium bicarbonate, 84.01

M_{r2} = molecular weight of sodium chloride, 58.44

Acceptance criteria: 90.0%–110.0% of the labeled amounts of potassium bicarbonate (KHCO₃) and sodium bicarbonate (NaHCO₃)

• ANHYDROUS CITRIC ACID

Mobile phase, Standard preparation 1, and Chromatographic system: Proceed as directed in *Assay for Citric Acid/Citrate and Phosphate* (345).

Sample solution: Nominally 20 µg/mL of citrate prepared as follows. Transfer the equivalent of 40 mg of anhydrous citric acid from *Sample stock solution A* in the *Assay for Potassium Bicarbonate and Sodium Bicarbonate* into a suitable volumetric flask, and proceed as directed in *Assay for Citric Acid/Citrate and Phosphate* (345), *Assay Preparation for Citric Acid/Citrate Assay*.

Analysis:

Samples: *Standard preparation 1* and *Sample solution*
 Proceed as directed in *Assay for Citric Acid/Citrate and Phosphate* (345), *Procedure*.

Calculate the percentage of the labeled amount of anhydrous citric acid (C₆H₈O₇) in the portion of Tablets for Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of citrate from the *Sample solution*

r_S = peak response of citrate from *Standard preparation 1*

C_S = concentration of citrate in *Standard preparation 1* (µg/mL)

C_U = nominal concentration of citrate in the *Sample solution* (µg/mL)

M_{r1} = molecular weight of anhydrous citric acid, 192.12

M_{r2} = molecular weight of citrate, 189.10

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- **ACID-NEUTRALIZING CAPACITY (301):** The acid consumed by the minimum single dose recommended in the labeling is NLT 5 mEq.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label Tablets for Oral Solution to state the sodium content. The label states also that the tablets are to be dissolved in water before being taken.
- **USP REFERENCE STANDARD (11)**
 USP Citric Acid RS

Potassium Bitartrate

C₄H₅KO₆ 188.18
 Butanedioic acid 2,3-dihydroxy-, [R-(R*,R*)]-, monopotassium salt;
 Potassium hydrogen tartrate [868-14-4].

DEFINITION

Potassium Bitartrate, dried at 105° for 3 h, contains NLT 99.0% and NMT 101.0% of C₄H₅KO₆.

IDENTIFICATION

- **A.** Ignite it: it leaves a residue that imparts a reddish purple color to a nonluminous flame.
- **B.** A saturated solution of it yields a yellowish orange precipitate with sodium cobaltinitrite TS.
- **C. IDENTIFICATION TESTS—GENERAL, Tartrate (191):** Meets the requirements

ASSAY**• PROCEDURE**

Sample: Dry 6 g of Potassium Bitartrate at 105° for 3 h. Allow to cool, and weigh.

Analysis: Dissolve the *Sample* in 100 mL of boiling water, add a few drops of phenolphthalein TS, and titrate with 1 N sodium hydroxide VS to a pink endpoint. Perform a blank determination (see *Titrimetry* (541)). Each mL of 1 N sodium hydroxide is equivalent to 188.2 mg of $C_4H_5KO_6$.

Acceptance criteria: 99.0%–101.0% on the previously dried basis

IMPURITIES**• INSOLUBLE MATTER**

Sample: 500 mg

Analysis: Mix the *Sample* with 3 mL of 6 N ammonium hydroxide.

Acceptance criteria: No undissolved residue remains.

• LIMIT OF AMMONIA

Sodium hypochlorite solution: Use a commercially available solution that contains 4.0%–6.0% of sodium hypochlorite.

Oxidizing solution: [NOTE—Prepare on the day of use.] Alkaline sodium citrate TS and *Sodium hypochlorite solution* (4:1)

Diluted sodium nitroferricyanide solution: Sodium nitroferricyanide TS and water (1:10)

Standard stock solution: Dry 300 mg of ammonium chloride over silica gel for 4 h, and use it to prepare a 0.3 mg/mL solution in water. This solution contains 100 µg/mL of ammonia.

Standard solution: 0.25 µg/mL of ammonia in water, from *Standard stock solution*

Sample solution: 2.5 mg/mL of Potassium Bitartrate in water. Heat gently to facilitate the dissolution.

Analysis

[NOTE—Carefully follow the order of addition stated below.]

Separately transfer 6.0 mL each of the *Standard solution* and the *Sample solution* to two color-comparison tubes. To each tube add 0.4 mL of phenol TS, 0.4 mL of *Diluted sodium nitroferricyanide solution*, and 1.0 mL of *Oxidizing solution*. Dilute with water to 10 mL, mix, and allow to stand for 1 h.

Acceptance criteria: The color of the *Sample solution* is not darker than the color of the *Standard solution* (NMT 0.01%).

Delete the following:

- **HEAVY METALS, Method II (231):** NMT 20 ppm • (Official 1-Jan-2018)

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Potassium Bromide

KBr 119.00

Potassium bromide.

Potassium bromide [7758-02-3].

» Potassium Bromide contains not less than 98.0 percent and not more than 100.5 percent of KBr, calculated on the dried basis. It contains no added substances.

Packaging and storage—Preserve in well-closed containers, and store at room temperature.

Appearance of solution: clear and colorless.

Test solution—Dissolve 10.0 g in carbon dioxide-free water, and dilute with the same solvent to 100 mL.

Identification—

A: A solution containing 4.5 mg of potassium bromide responds to the test for *Bromide* (191).

B: Responds to the test for *Potassium* (191).

Acidity or alkalinity—To 10 mL of the solution prepared for the test for *Appearance of solution*, add 0.1 mL of bromothymol blue TS: not more than 0.5 mL of 0.01 N hydrochloric acid or 0.01 N sodium hydroxide is required to change the color of this solution.

Loss on drying (731)—Dry it at 100° to 105° for 3 hours: it loses not more than 1.0% of its weight.

Bromates—

Starch—mercuric iodide solution—Triturate 1.0 g of soluble starch with 5 mL of water and pour the mixture into 100 mL of boiling water, containing 10 mg of mercuric iodide.

Procedure—To 10 mL of the solution prepared for the test for *Appearance of solution* add 1 mL of *Starch—mercuric iodide solution*, 0.1 mL of a 100 g per L solution of potassium iodide, and 0.25 mL of 0.5 M sulfuric acid. Allow to stand protected from light for 5 minutes: no blue or violet color develops.

Limit of chlorine: not more than 0.6%.

Nitric acid solution and Ferric ammonium sulfate solution—Proceed as directed in the Assay.

Procedure—Dissolve 1.000 g of Potassium Bromide in 20 mL of *Nitric acid solution* in a conical flask, add and mix 5 mL of 30 percent hydrogen peroxide, and heat in a water bath until the solution is colorless. Rinse the sides of the flask with a small quantity of water, and heat in a water bath for 15 minutes. Allow to cool, dilute with water to 50 mL, and add 5.0 mL of silver nitrate VS and 1 mL of dibutyl phthalate. Mix, and back titrate the excess silver nitrate with ammonium thiocyanate VS (see *Titrimetry* (541)), using 5 mL of *Ferric ammonium sulfate solution* as the indicator. Perform a blank titration. Not more than 1.7 mL of silver nitrate VS is used.

Iodides—To 5 mL of the solution prepared for the test for *Appearance of solution* add 0.15 mL of a 10.5 g per 100 mL ferric chloride solution, and 2 mL of dichloromethane. Shake, and allow to separate. The lower layer is colorless.

Sulfates (221)—A 2.0-g portion shows no more sulfate than corresponds to 0.2 mL of 0.020 N sulfuric acid (0.01%).

Limit of iron: not more than 20 ppm.

Citric acid solution—Prepare a 200-mg citric acid per mL solution.

Iron standard solution—Transfer 0.863 g of ferric ammonium sulfate to a 500-mL volumetric flask, and dissolve in 25 mL of dilute sulfuric acid. Dilute with water to volume. Transfer 1.0 mL of the resulting solution to a 10-mL volumetric flask, and dilute with water to volume. Transfer 2.5 mL of this resulting solution to a 50-mL volumetric flask, and dilute with water to volume. [NOTE—Prepare immediately before use.]

Test solution—Transfer 5 mL of the solution prepared for the test for *Appearance of solution* to a 10-mL volumetric flask, and dilute with water to volume.

Procedure—To 10 mL each of the *Iron standard solution* and the *Test solution* add 2.0 mL of the *Citric acid solution*

and 0.1 mL of thioglycolic acid. Make alkaline to litmus with ammonia water, and dilute with water to 20 mL. After 5 minutes, any pink color in the *Test solution* is not more intense than that in the *Iron standard solution*.

Magnesium and alkaline-earth metals—To 200 mL of water add 0.1 g of hydroxylamine hydrochloride, 10 mL of pH 10.0 ammonia–ammonium chloride buffer (prepared by dissolving 5.4 g of ammonium chloride in 20 mL of water, adding 20 mL of ammonium hydroxide and diluting to 100 mL), 1 mL of 0.1 M zinc sulfate, and about 0.2 g of eriochrome black T titration. Heat to about 40°. Titrate this solution (see *Titrimetry* (541)) with 0.01 M edetate disodium VS until the violet color changes to deep blue. To this solution add 10.0 g of Potassium Bromide dissolved in 100 mL of water. If the color changes to violet, titrate the solution with 0.01 M edetate disodium VS to a deep blue endpoint. The volume of 0.01 M edetate disodium consumed in the second titration does not exceed 5.0 mL (0.02%, calculated as Ca).

Delete the following:

• **Heavy metals, Method I (231):** not more than 10 ppm.

• (Official 1-Jan-2018)

Assay—

Nitric acid solution—Dilute 14 mL of nitric acid with water to 100 mL.

Ferric ammonium sulfate solution—Transfer 10 g of ferric ammonium sulfate to a 100-mL volumetric flask. Dissolve in and dilute with water to volume.

Procedure—Dissolve 2.000 g of Potassium Bromide in water, and dilute with water to 100.0 mL. To 10.0 mL of the solution add 50 mL of water, 5 mL of *Nitric acid solution*, 25.0 mL of silver nitrate VS, and 2 mL of dibutyl phthalate. Mix, and back titrate the excess silver nitrate with ammonium thiocyanate VS (see *Titrimetry* (541)), using 2 mL of *Ferric ammonium sulfate solution* as the indicator, shaking vigorously towards the endpoint. Each mL of 0.1 M silver nitrate is equivalent to 11.90 mg of KBr. Calculate the percent content of Potassium Bromide, corrected for the chloride content, by the formula:

$$a - 3.357b$$

in which *a* is the percent content of KBr and KCl obtained, calculated as KBr; and *b* is the percent content of chlorides.

Potassium Bromide Compounded Oral Solution, Veterinary

DEFINITION

Potassium Bromide Compounded Oral Solution, Veterinary contains NLT 225 mg and NMT 275 mg of potassium bromide (KBr) per mL, equivalent to NLT 151 mg and NMT 185 mg of bromide (Br⁻) per mL.

Prepare Potassium Bromide Compounded Oral Solution, Veterinary as follows (see *Pharmaceutical Compounding—Non-sterile Preparations* (795)).

Potassium Bromide	25 g
Purified Water	60 mL
Corn Syrup, FCC, a sufficient quantity to make	100 mL

Dissolve the *Potassium Bromide* in *Purified Water*. Add *Corn Syrup*, FCC, to bring to final volume with mixing.

ASSAY

• PROCEDURE

TCA solution: 20% (w/v) trichloroacetic acid in water
Gold chloride solution: 5 mg/mL of gold chloride in water

Standard stock solution: Dissolve USP Sodium Bromide RS in water to obtain a solution with a nominal concentration of 20 mg/mL of bromide.

Standard solutions: Prepare four solutions of known concentrations of about 2.0, 1.0, 0.5, and 0.25 mg/mL of bromide by diluting the *Standard stock solution* with water.

Sample solution: Dilute Oral Solution, Veterinary quantitatively with water (1:99).

Blank: Water

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: Vis

Analytical wavelength: 440 nm

System suitability

Samples: *Standard solutions* and *Blank*

Suitability requirements

Correlation coefficient: NLT 0.99, linear regression of the *Standard solutions*

Analysis

Samples: *Sample solution* and *Blank*

To 750-μL aliquots of each *Sample* add 500 μL of TCA solution and 250 μL of *Gold chloride solution*. Mix on a vortex mixer, and immediately read the absorbance of each *Sample*.

Calculate the concentration, in mg/mL, of bromide (Br⁻) in the portion of Oral Solution, Veterinary taken:

$$\text{Result} = C \times D$$

C = concentration of the *Sample solution* (mg/mL) obtained from the standard curve

D = dilution factor of the *Sample solution*, 100

Acceptance criteria: 151–185 mg/mL of bromide (Br⁻)

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in a tight container, and store in a refrigerator.
- **BEYOND-USE DATE:** NMT 180 days after the date on which it was compounded when stored in a refrigerator
- **LABELING:** Label it to state the *Beyond-Use Date*. Label it to indicate that it is for veterinary use only.
- **USP REFERENCE STANDARDS (11)**
USP Sodium Bromide RS

Potassium Carbonate

K₂CO₃ (anhydrous) 138.21

K₂CO₃ · 1½H₂O 165.23

Carbonic acid, dipotassium salt;
Dipotassium carbonate [584-08-7].

DEFINITION

Potassium Carbonate contains NLT 99.5% and NMT 100.5% of K₂CO₃, calculated on the dried basis.

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Potassium (191):**
Meets the requirements
- **B. IDENTIFICATION TESTS—GENERAL, Carbonate (191):**
Meets the requirements

ASSAY

• PROCEDURE

Sample: Dried potassium carbonate obtained in the test for *Loss on Drying*

Analysis: Transfer the *Sample* to a flask with the aid of 150 mL of water, and add 4 drops of methyl orange TS. Titrate with 1 N hydrochloric acid VS. Each mL of 1 N hydrochloric acid is equivalent to 69.11 mg of K_2CO_3 .

Acceptance criteria: 99.5%–100.5% on the dried basis

IMPURITIES

Delete the following:

• HEAVY METALS (231)

Analysis: Dissolve 4.0 g in 10 mL of water. Add 15 mL of 3 N hydrochloric acid, and heat to boiling. Add 1 drop of phenolphthalein TS, and neutralize with 1 N sodium hydroxide until the solution is faintly pink in color. Cool, and dilute with water to 25 mL.

Acceptance criteria: NMT 5 ppm • (Official 1-Jan-2018)

SPECIFIC TESTS

- **LOSS ON DRYING (731):** Dry a sample at 180° for 4 h: it loses NMT 0.5% of its weight.

• INSOLUBLE SUBSTANCES

Sample solution: 1 g in 20 mL of water

Acceptance criteria: The solution is complete, clear, and colorless.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Potassium Chloride

KCl 74.55
Potassium chloride [7447-40-7].

DEFINITION

Potassium Chloride contains NLT 99.0% and NMT 100.5% of KCl, calculated on the dried basis.

IDENTIFICATION

• A. IDENTIFICATION TESTS—GENERAL, Potassium (191)

Sample solution: 50 mg/mL

Acceptance criteria: Meets the requirements

• B. IDENTIFICATION TESTS—GENERAL, Chloride (191)

Sample solution: 50 mg/mL

Acceptance criteria: Meets the requirements

ASSAY

• PROCEDURE

Sample: 200 mg

Analysis: Dissolve the *Sample* in 10 mL of water. Add 10 mL of glacial acetic acid, 75 mL of methanol, and 3 drops of eosin Y TS. Titrate, with shaking, with 0.1 N silver nitrate VS to a pink endpoint. Each mL of 0.1 N silver nitrate is equivalent to 7.455 mg of KCl.

Acceptance criteria: 99.0%–100.5% on the dried basis

IMPURITIES

- **ALUMINUM (206)** (where it is labeled as intended for use in hemodialysis): Proceed as directed, using 2.0 g of Potassium Chloride to prepare the *Test preparation*.

Acceptance criteria: NMT 1 ppm

• SODIUM

Sample solution: 50 mg/mL

Acceptance criteria: *Sample solution* tested on a platinum wire does not impart a pronounced yellow color to a nonluminous flame.

• IODIDE

Standard stock solution: 1.64 mg/mL of potassium iodide in water

Standard solution: Dilute 1.0 mL of *Standard stock solution* with water to 25 mL. Dilute 2.0 mL of this solution with water to 8 mL. Add 1 mL each of chloroform and diluted hydrochloric acid, then add 2 drops of a chloramine T solution (0.1 in 100), and shake gently.

Sample solution: Dissolve 2 g of Potassium Chloride in 8 mL of water. Add 1 mL each of chloroform and diluted hydrochloric acid, then add 2 drops of a chloramine T solution (0.1 in 100), and shake gently.

Acceptance criteria: The violet color of the chloroform layer is not darker than that of a concomitantly prepared *Standard solution* (NMT 0.005%).

• BROMIDE

Standard stock solution: 1.28 mg/mL of sodium bromide in water

Standard solution: Dilute 2.0 mL of *Standard stock solution* with water to 8 mL. Add 1 mL each of chloroform and diluted hydrochloric acid, then add 5 drops of a chloramine T solution (1 in 100), and shake gently.

Sample solution: Dissolve 2 g of Potassium Chloride in 8 mL of water. Add 1 mL each of chloroform and diluted hydrochloric acid, then add 5 drops of a chloramine T solution (1 in 100), and shake gently.

Acceptance criteria: The brown color of the chloroform layer is not darker than that of a concomitantly prepared *Standard solution* (NMT 0.1%).

• CALCIUM AND MAGNESIUM

Sample solution: 10 mg/mL in water

Analysis: To 20 mL of *Sample solution* add 2 mL each of 6 N ammonium hydroxide, ammonium oxalate TS, and dibasic sodium phosphate TS.

Acceptance criteria: No turbidity is produced within 5 min.

Delete the following:

• HEAVY METALS (231)

Sample solution: 2.0 g in 25 mL of water

Acceptance criteria: NMT 10 ppm • (Official 1-Jan-2018)

SPECIFIC TESTS

- **ACIDITY OR ALKALINITY:** To a solution of 5.0 g in 50 mL of carbon dioxide-free water add 3 drops of phenolphthalein TS: no pink color is produced. Then add 0.30 mL of 0.020 N sodium hydroxide: a pink color is produced.
- **LOSS ON DRYING (731):** Dry a sample at 105° for 2 h: it loses NMT 1.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** Where Potassium Chloride is intended for use in hemodialysis, it is so labeled.

Potassium Chloride Extended-Release Capsules

» Potassium Chloride Extended-Release Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of KCl.

Packaging and storage—Preserve in tight containers at a temperature not exceeding 30°.

Identification—A portion of the filtrate obtained as directed under *Assay* in the *Assay* responds to the tests for *Potassium (191)* and for *Chloride (191)*.

Dissolution (711)—

Medium: water; 900 mL.

Apparatus 1: 100 rpm.

Time: 2 hours.

Standard stock solution and Standard solutions—Prepare as directed in the Assay under *Potassium Chloride Oral Solution*.

Procedure—Filter the solution under test, and dilute quantitatively with *Dissolution Medium* to obtain a test solution containing about 60 µg of potassium chloride per mL. Add 5.0 mL of the test solution to a 100-mL volumetric flask, add 2.0 mL of sodium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, dilute with water to volume, mix, and proceed as directed for *Instrumental conditions and Analysis* in the Assay under *Potassium Chloride Oral Solution*. Calculate the quantity, in mg, of KCl dissolved by the formula:

$$(900F)(1.907C)$$

in which *F* is the extent of dilution of the solution under test, and the other terms are as defined therein.

Tolerances—Not more than 35% (*Q*) of the labeled amount of KCl is dissolved in 2 hours. The requirements are met if the quantities dissolved from the Capsules tested conform to the accompanying acceptance table instead of the table shown under *Dissolution* (711).

Acceptance Table

Stage	Number Tested	Acceptance Criteria
S ₁	6	Each unit is within the range $Q \pm 30\%$.
S ₂	6	Average of 12 units ($S_1 + S_2$) is within the range between $Q - 30\%$ and $Q + 35\%$, and no unit is outside the range $Q \pm 40\%$.
S ₃	12	Average of 24 units ($S_1 + S_2 + S_3$) is within the range between $Q - 30\%$ and $Q + 35\%$, and not more than 2 units are outside the range $Q \pm 40\%$.

Uniformity of dosage units (905): meet the requirements.

Assay—

Standard stock solution and Standard solutions—Prepare as directed in the Assay under *Potassium Chloride Oral Solution*.

Assay preparation—Place not less than 20 Capsules in a suitable container with 400 mL of water, heat to boiling, and boil for 20 minutes. Allow to cool, transfer the solution to a 1000-mL volumetric flask, dilute with water to volume, and mix. Filter, discarding the first 20 mL of the filtrate. Transfer an accurately measured volume of the subsequent filtrate, equivalent to about 60 mg of potassium chloride, to a 1000-mL volumetric flask, dilute with water to volume, and mix. (Retain a portion of the filtrate for use in the *Identification* test.) Transfer 5.0 mL of the resulting solution to a 100-mL volumetric flask, add 2.0 mL of sodium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, dilute with water to volume, and mix.

Procedure—Proceed as directed for *Instrumental conditions and Analysis* in the Assay under *Potassium Chloride Oral Solution*, except use *Assay preparation* instead of *Sample solution*. Calculate the quantity, in mg, of KCl in each Capsule taken by the formula:

$$(TC/D)(1.907)$$

in which *T* is the labeled quantity, in mg, of potassium chloride in each Capsule, *D* is the concentration, in µg per mL, of potassium chloride in the *Assay preparation*, based on the labeled quantity per Capsule and the extent of dilution, and the other terms are as defined therein.

Potassium Chloride for Injection Concentrate

» Potassium Chloride for Injection Concentrate is a sterile solution of Potassium Chloride in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of KCl.

Packaging and storage—Preserve in single-dose or in multiple-dose containers, preferably of Type I or Type II glass.

Labeling—The label states the potassium chloride content in terms of weight and of milliequivalents in a given volume. Label the Concentrate to indicate that it is to be diluted to appropriate strength with water or other suitable fluid prior to administration. Immediately following the name, the label bears the boxed warning:

Concentrate Must be Diluted Before Use

This warning is not required when the liquid preparation is in a *Pharmacy bulk package* and the label thereon states prominently "Pharmacy Bulk Package—Not for direct infusion."

The cap of the container and the overseal of the cap must be black, and both bear the words: "Must Be Diluted" in readily legible type, in a color that stands out from its background OR the overseal may be of a clear plastic material through which the black cap is visible and the printing is readily legible.

When the nature of the container-closure system prevents compliance, the design shall follow the intent of this requirement as closely as possible, the black color being used beneath the words "Must be Diluted," which are so placed that words are readily visible as the contents of the container are being removed. Ampuls shall be identified by a black band or a series of black bands above the constriction. The label states also the total osmolar concentration in mOsmol per L. Where the contents are less than 100 mL, the label alternatively may state the total osmolar concentration in mOsmol per mL.

USP Reference standards (11)—

USP Endotoxin RS

Identification—It responds to the tests for *Potassium* (191) and for *Chloride* (191).

Bacterial Endotoxins Test (85): It contains not more than 8.80 USP Endotoxin Units per mEq.

pH (791): between 4.0 and 8.0.

Particulate Matter in Injections (788): meets the requirements under small-volume injections.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—

Potassium stock solution and Standard preparations—Prepare as directed in the Assay under *Potassium Chloride Oral Solution*.

Assay preparation—Transfer an accurately measured volume of Concentrate, equivalent to about 600 mg of potassium chloride, to a 500-mL volumetric flask, dilute with water to volume, and mix. Proceed as directed for *Assay preparation* in the Assay under *Potassium Chloride Oral Solution*, beginning with "Transfer 5.0 mL of the solution to a 100-mL volumetric flask."

Procedure—Proceed as directed for *Procedure* in the Assay under *Potassium Chloride Oral Solution*. Calculate the quan-

tity, in mg, of KCl in the portion of Concentrate taken by the formula:

$$200C(1.907)$$

in which the terms are as defined therein.

Potassium Chloride Oral Solution

DEFINITION

Potassium Chloride Oral Solution contains NLT 95.0% and NMT 105.0% of the labeled amount of potassium chloride (KCl). It may contain alcohol.

IDENTIFICATION

• A. IDENTIFICATION TESTS—GENERAL, Potassium (191)

Sample solution: Carefully evaporate 5 mL to dryness, and ignite the residue at dull-red heat to remove all organic matter. Cool, dissolve the residue in 10 mL of water, and filter.

Acceptance criteria: Meets the requirements

• B. IDENTIFICATION TESTS—GENERAL, Chloride (191)

Sample solution: Carefully evaporate 5 mL to dryness, and ignite the residue at dull-red heat to remove all organic matter. Cool, dissolve the residue in 10 mL of water, and filter.

Acceptance criteria: Meets the requirements

ASSAY

• PROCEDURE

Standard stock solution: 19.07 µg/mL of potassium chloride, previously dried at 105° for 2 h, in water. This solution contains 10 µg/mL of potassium.

Standard solutions: To separate 100-mL volumetric flasks transfer 10.0, 15.0, and 20.0 mL, respectively, of *Standard stock solution*. To each flask add 2.0 mL of sodium chloride solution (200 mg/mL) and 1.0 mL of hydrochloric acid, and dilute with water to volume. The *Standard solutions* contain, respectively, 1.0, 1.5, and 2.0 µg/mL of potassium.

Sample stock solution: Transfer a volume of Oral Solution, equivalent to 600 mg of potassium chloride, to a 500-mL volumetric flask, and dilute with water to volume. Transfer 5.0 mL of the solution to a 100-mL volumetric flask, and dilute with water to volume.

Sample solution: Transfer 5.0 mL of *Sample stock solution* to a 100-mL volumetric flask, add 2.0 mL of sodium chloride solution (200 mg/mL) and 1.0 mL of hydrochloric acid, and dilute with water to volume.

Instrumental conditions

(See *Atomic Absorption Spectroscopy* (852).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Potassium emission line at 766.5 nm

Lamp: Potassium hollow-cathode

Flame: Air-acetylene

Blank: Water

Analysis

Samples: *Standard solutions*, *Sample solution*, and *Blank*. Plot the absorbance of the *Standard solutions* versus the concentration of potassium, in µg/mL, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration of potassium in the *Sample solution* (µg/mL).

Calculate the percentage of the labeled amount of potassium chloride (KCl) in the portion of Oral Solution taken:

$$\text{Result} = (C/C_u) \times (M_r/A_r) \times 100$$

C = concentration of potassium in the *Sample solution* as determined in this test (µg/mL)

C_u = nominal concentration of potassium chloride in the *Sample solution* (µg/mL)

M_r = molecular weight of potassium chloride, 74.55

A_r = atomic weight of potassium, 39.10

Acceptance criteria: 95.0%–105.0%

SPECIFIC TESTS

- **ALCOHOL DETERMINATION, Method II (611)** (if present): NLT 90.0% and NMT 115.0% of the labeled amount, the labeled amount being NMT 7.5% of C_2H_5OH , acetone being used as the internal standard

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Potassium Chloride for Oral Solution

» Potassium Chloride for Oral Solution is a dry mixture of Potassium Chloride and one or more suitable colors, diluents, and flavors. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of KCl.

Packaging and storage—Preserve in tight containers.

Labeling—The label states the Potassium Chloride (KCl) content in terms of weight and in terms of milliequivalents.

Identification—Ignite about 200 mg at a temperature not above 600°, in order to remove all organic matter, cool, dissolve the residue in 10 mL of water, and filter: the filtrate responds to the tests for *Potassium* (191) and for *Chloride* (191).

Minimum fill (755)—

FOR SOLID PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

Uniformity of dosage units (905)—

FOR SOLID PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

Assay—

Standard stock solution and *Standard solutions*—Prepare as directed in the Assay under *Potassium Chloride Oral Solution*.

Assay preparation 1 (where it is packaged in unit-dose containers)—Weigh and mix the contents of not less than 20 containers of Potassium Chloride for Oral Solution. Transfer an accurately weighed portion of the powder, equivalent to about 1.5 g of potassium chloride, to a 500-mL volumetric flask, dissolve in water, dilute with water to volume, and mix. Transfer 5.0 mL of the solution to a 250-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of the resulting solution to a 100-mL volumetric flask, add 2.0 mL of sodium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, dilute with water to volume, and mix.

Assay preparation 2 (where it is packaged in multiple-unit containers)—Transfer an accurately weighed portion of Potassium Chloride for Oral Solution, equivalent to about 1.5 g of potassium chloride, to a 500-mL volumetric flask, dissolve in water, dilute with water to volume, and mix. Proceed as directed for *Assay preparation 1*, beginning with "Transfer 5.0 mL of the solution."

Procedure—Proceed as directed for *Instrumental conditions* and *Analysis* in the Assay under *Potassium Chloride Oral Solution*, except use *Assay preparation 1* or *Assay preparation 2* instead of *Sample solution*. Calculate the quantity of KCl, in mg, in the portion of Potassium Chloride for Oral Solution taken by the formula:

$$500C(1.907)$$

in which C is as defined therein.

Potassium Chloride Extended-Release Tablets

» Potassium Chloride Extended-Release Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of potassium chloride (KCl).

Packaging and storage—Preserve in tight containers at a temperature not exceeding 30°.

Labeling—The labeling states with which *Assay preparation* the product complies only if *Assay preparation 1* is not used.

Identification—A portion of the filtrate obtained as directed for the designated *Assay preparation* in the *Assay* meets the requirements of the tests for *Potassium* (191) and for *Chloride* (191).

Dissolution (711)—

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Time: 2 hours.

Standard stock solution—Prepare as directed in the *Assay* under *Potassium Chloride Oral Solution*.

Standard solutions—Prepare as directed for *Standard solutions* in the *Assay* under *Potassium Chloride Oral Solution*.

Procedure—Filter the solution under test, and dilute quantitatively with *Dissolution Medium* to obtain a test solution containing about 60 µg of potassium chloride per mL. Place 5.0 mL of the test solution in a 100-mL volumetric flask, add 2.0 mL of sodium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, dilute with water to volume, mix, and proceed as directed for *Instrumental conditions* and *Analysis* in the *Assay* under *Potassium Chloride Oral Solution*. Calculate the quantity, in mg, of KCl dissolved by the formula:

$$(900F)(1.907C)$$

in which *F* is the extent of dilution of the solution under test, and the other terms are as defined therein.

Tolerances—Not more than 35% (*Q*) of the labeled amount of KCl is dissolved in 2 hours. The requirements are met if the quantities dissolved from the Tablets tested conform to the accompanying acceptance table instead of the table shown under *Dissolution* (711).

Acceptance Table

Stage	Number Tested	Acceptance Criteria
S ₁	6	Each unit is within the range $Q \pm 30\%$.
S ₂	6	Average of 12 units ($S_1 + S_2$) is within the range between $Q - 30\%$ and $Q + 35\%$, and no unit is outside the range $Q \pm 40\%$.
S ₃	12	Average of 24 units ($S_1 + S_2 + S_3$) is within the range between $Q - 30\%$ and $Q + 35\%$, and not more than 2 units outside the range $Q \pm 40\%$.

Uniformity of dosage units (905): meet the requirements.

Assay—[NOTES—If necessary, first score nonsugar-coated tablets. Retain a portion of the filtrate of either *Assay preparation 1* or *Assay preparation 2* for use in the test for *Identification*.]

Standard stock solution and Standard solutions—Prepare as directed in the *Assay* under *Potassium Chloride Oral Solution*.

Assay preparation 1—Place not fewer than 20 Tablets in a suitable container with 400 mL of water, heat to boiling,

and boil for 20 minutes. Allow to cool, transfer the solution to a 1000-mL volumetric flask, dilute with water to volume, and mix. Filter, discarding the first 20 mL of the filtrate. Transfer an accurately measured volume of the subsequent filtrate, equivalent to about 60 mg of potassium chloride, to a 1000-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of the resulting solution to a 100-mL volumetric flask, add 2.0 mL of sodium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, dilute with water to volume, and mix.

Assay preparation 2 (For formulations containing crystals coated with hydrophobic polymers)—Place not fewer than 20 Tablets in a 2000-mL volumetric flask. Add 1200 mL of a mixture of acetonitrile and water (1:1), and shake by mechanical means, or stir using a magnetic bar for 90 minutes. Dilute with the mixture of acetonitrile and water (1:1) to volume. Allow to stand for 90 minutes. Pass through a filter having a 0.2-µm porosity. Transfer an accurately measured volume of the filtrate, quantitatively dilute with water to obtain a solution having a concentration of about 0.06 mg per mL, and mix. [NOTE—Retain a portion of the filtrate for use in the test for *Identification*.] Transfer 5.0 mL of the resulting solution to a 100-mL volumetric flask, add 2.0 mL of sodium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, dilute with water to volume, and mix.

Procedure—Proceed as directed for *Instrumental conditions* and *Analysis* in the *Assay* under *Potassium Chloride Oral Solution*, except use *Assay preparation 1* or *Assay preparation 2* instead of *Sample solution*. Calculate the quantity, in mg, of potassium chloride (KCl) in each Tablet taken by the formula:

$$1.907(TC/D)$$

in which *T* is the labeled quantity, in mg, of potassium chloride in each Tablet; *D* is the concentration, in µg per mL, of potassium chloride in the designated *Assay preparation*, based on the labeled quantity per Tablet and the extent of dilution; and the other terms are as defined therein.

Potassium Chloride in Dextrose Injection

DEFINITION

Potassium Chloride in Dextrose Injection is a sterile solution of Potassium Chloride and Dextrose in Water for Injection. It contains NLT 95.0% and NMT 110.0% of the labeled amount of potassium chloride (KCl) and NLT 95.0% and NMT 105.0% of the labeled amount of dextrose ($C_6H_{12}O_6 \cdot H_2O$). It contains no antimicrobial agents.

IDENTIFICATION

A.

Sample solution: Nominally 50 mg/mL of dextrose from a suitable volume of Injection in water

Analysis: Add a few drops of the *Sample solution* to 5 mL of hot alkaline cupric tartrate TS.

Acceptance criteria: A copious red precipitate of cuprous oxide is formed.

B.

The sample imparts a violet color to a nonluminous flame. Since the presence of small quantities of sodium masks the color, screen out the yellow color produced by the sodium by viewing through a blue filter that blocks emission at 589 nm (sodium) but is transparent to emission at 404 nm (potassium). [NOTE—Traditionally, cobalt glass has been used, but other suitable filters are commercially available.]

C. IDENTIFICATION TESTS—GENERAL (191), Chloride: Meets the requirements

ASSAY**• DEXTROSE**

Sample solution: Nominally 20–50 mg/mL of dextrose from Injection prepared as follows. Transfer a volume of Injection, containing 2–5 g of dextrose, to a 100-mL volumetric flask. Add 0.2 mL of 6 N ammonium hydroxide and dilute with water to volume.

Analysis

Sample: *Sample solution*

Determine the angular rotation in a suitable polarimeter tube (see *Optical Rotation* (781)).

Calculate the percentage of the labeled amount of dextrose ($C_6H_{12}O_6 \cdot H_2O$) in the portion of Injection taken:

$$\text{Result} = [(100 \times a)/(l \times \alpha)] \times (1/C_U) \times (M_{r1}/M_{r2}) \times 100$$

a = observed angular rotation of the *Sample solution* ($^\circ$)

l = length of the polarimeter tube (dm)

α = midpoint of the specific rotation range for anhydrous dextrose, 52.9°

C_U = nominal concentration of dextrose in the *Sample solution* (g/100 mL)

M_{r1} = molecular weight of dextrose monohydrate, 198.17

M_{r2} = molecular weight of anhydrous dextrose, 180.16

Acceptance criteria: 95.0%–105.0%

• POTASSIUM CHLORIDE

Sample solution: Transfer a volume of Injection, equivalent to 75–150 mg of potassium chloride, to a conical flask. Add water, if necessary, to bring the volume to 10 mL, and add 10 mL of glacial acetic acid, 75 mL of methanol, and 3 drops of eosin Y TS.

Titrimetric system

Mode: Direct titration

Titrant: 0.1 N silver nitrate VS

Endpoint detection: Visual

Indicator: Eosin Y TS

Analysis

Sample: *Sample solution*

Titrate, with shaking, with *Titrant* to a pink endpoint.

Calculate the percentage of the labeled amount of potassium chloride (KCl) in the portion of Injection taken:

$$\text{Result} = V \times N \times (F/W) \times 100$$

V = *Titrant* volume consumed by the *Sample solution* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 74.55 mg/mEq

W = nominal amount of potassium chloride in the *Sample solution* (mg)

Acceptance criteria: 95.0%–110.0%

IMPURITIES**• LIMIT OF 5-HYDROXYMETHYLFURFURAL AND RELATED SUBSTANCES**

Sample solution: Nominally 2.0 mg/mL of dextrose from Injection in water

Instrumental conditions

Mode: UV

Analytical wavelength: 284 nm

Cell: 1 cm

Blank: Water

Analysis

Samples: *Sample solution* and *Blank*

Determine the absorbance of the *Sample solution*.

Acceptance criteria: NMT 0.25

SPECIFIC TESTS**• BACTERIAL ENDOTOXINS TEST (85):** NMT 0.5 USP Endotoxin Units/mL**• PH (791)**

Sample solution: Nominally 5% of dextrose from a portion of Injection in water

Acceptance criteria: 3.5–6.5

• OTHER REQUIREMENTS: It meets the requirements under *Injections and Implanted Drug Products* (1).**ADDITIONAL REQUIREMENTS****• PACKAGING AND STORAGE:** Preserve in single-dose glass or plastic containers. Glass containers are preferably Type I or Type II.**• LABELING:** The label states the total osmolar concentration in mOsmol/L. Where the contents are less than 100 mL, or where the label states that the Injection is not for direct injection but is to be diluted before use, the label alternatively may state the total osmolar concentration in mOsmol/mL. The content of potassium, in mEq, is prominently displayed on the label.**• USP REFERENCE STANDARDS (11)**

USP Endotoxin RS

Potassium Chloride in Dextrose and Sodium Chloride Injection**DEFINITION**

Potassium Chloride in Dextrose and Sodium Chloride Injection is a sterile solution of Potassium Chloride, Dextrose, and Sodium Chloride in Water for Injection. It contains NLT 95.0% and NMT 110.0% of the labeled amounts of potassium (K) and chloride (Cl) and NLT 95.0% and NMT 105.0% of the labeled amounts of dextrose ($C_6H_{12}O_6 \cdot H_2O$) and sodium (Na). It contains no antimicrobial agents.

IDENTIFICATION**• A.** The sample imparts an intense yellow color to a nonluminous flame.**• B.**

Analysis: To 2 mL of Injection, add 5 mL of sodium cobaltinitrite TS.

Acceptance criteria: A yellow precipitate is formed immediately. If necessary, centrifuge the solution and examine the precipitate (presence of potassium).

• C. IDENTIFICATION TESTS—GENERAL (191), Chloride: Meets the requirements**• D.**

Sample solution: Nominally 50 mg/mL of dextrose from a suitable volume of Injection in water

Analysis: Add a few drops of the *Sample solution* to 5 mL of hot alkaline cupric tartrate TS.

Acceptance criteria: A copious red precipitate of cuprous oxide is formed.

ASSAY**• CHLORIDE**

Sample solution: Transfer a volume of Injection, equivalent to 55 mg of chloride, to a suitable conical flask. Add 10 mL of glacial acetic acid, 75 mL of methanol, and 3 drops of eosin Y TS.

Titrimetric system

Mode: Direct titration

Titrant: 0.1 N silver nitrate VS

Endpoint detection: Visual

Analysis

Sample: *Sample solution*

Titrate, with shaking, with *Titrant* to a pink endpoint.

Each mL of *Titrant* is equivalent to 3.545 mg of chloride (Cl). Each mg of chloride is equivalent to 0.0282 mEq of chloride (Cl).

Calculate the percentage of the labeled amount of chloride (Cl) in the portion of Injection taken:

$$\text{Result} = V \times N \times (F/W) \times 100$$

V = Titrant volume consumed by the *Sample solution* (mL)
 N = actual normality of the *Titrant* (mEq/mL)
 F = equivalency factor, 35.45 mg/mEq
 W = nominal amount of chloride in the *Sample solution* (mg)

Acceptance criteria: 95.0%–110.0%

• DEXTROSE

Sample solution: Nominally 20–50 mg/mL of dextrose from Injection prepared as follows. Transfer a volume of Injection, containing 2–5 g of dextrose, to a 100-mL volumetric flask. Add 0.2 mL of 6 N ammonium hydroxide and dilute with water to volume.

Analysis

Sample: *Sample solution*

Determine the angular rotation in a suitable polarimeter tube (see *Optical Rotation* (781)).

Calculate the percentage of the labeled amount of dextrose ($C_6H_{12}O_6 \cdot H_2O$) in the portion of Injection taken:

$$\text{Result} = [(100 \times a)/(l \times \alpha)] \times (1/C_U) \times (M_{r1}/M_{r2}) \times 100$$

a = observed angular rotation of the *Sample solution* ($^\circ$)

l = length of the polarimeter tube (dm)

α = midpoint of the specific rotation range for anhydrous dextrose, 52.9°

C_U = nominal concentration of dextrose in the *Sample solution* (g/100 mL)

M_{r1} = molecular weight of dextrose monohydrate, 198.17

M_{r2} = molecular weight of anhydrous dextrose, 180.16

Acceptance criteria: 95.0%–105.0%

• POTASSIUM AND SODIUM

Internal standard solution: 1.04 mg/mL of lithium nitrate in water prepared as follows. Transfer 1.04 g of lithium nitrate to a 1000-mL volumetric flask, add a suitable nonionic surfactant, and dilute with water to volume.

Potassium stock solution: 74.56 mg/mL of potassium chloride (equivalent to 1 mEq/mL of potassium) prepared as follows. Transfer 18.64 g of potassium chloride, previously dried at 105° for 2 h, to a 250-mL volumetric flask. Dilute with water to volume.

Sodium stock solution: 58.44 mg/mL of sodium chloride (equivalent to 1 mEq/mL of sodium) prepared as follows. Transfer 14.61 g of sodium chloride, previously dried at 105° for 2 h, to a 250-mL volumetric flask. Dilute with water to volume.

Standard stock solution: 0.0391/ mg/mL of potassium (K) from the *Potassium stock solution* and 0.02299/ mg/mL of sodium (Na) from the *Sodium stock solution* prepared as follows. Transfer 0.1/ mL of the *Potassium stock solution* and 0.1/ mL of the *Sodium stock solution* to a 100-mL volumetric flask, where l and l' are the labeled amounts in (mEq/L) of potassium and sodium, respectively, in the Injection. Dilute with water to volume.

Standard solution: Transfer 5.0 mL of the *Standard stock solution* to a 500-mL volumetric flask, and dilute with the *Internal standard solution* to volume.

Sample solution: Transfer 5.0 mL of Injection to a 500-mL volumetric flask, and dilute with the *Internal standard solution* to volume.

Instrumental conditions

Mode: Flame photometer

Analytical wavelengths

Potassium: 766 nm

Sodium: 589 nm

Lithium: 671 nm

Blank: *Internal standard solution*

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

Use the *Blank* to zero the instrument. Concomitantly determine the flame emission readings for the *Standard solution* and the *Sample solution*.

Calculate the percentage of the labeled amount of potassium (K) in the portion of Injection taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = emission reading ratio of potassium to lithium from the *Sample solution*

R_S = emission reading ratio of potassium to lithium from the *Standard solution*

C_S = concentration of potassium (K) in the *Standard stock solution* (mg/mL)

C_U = nominal concentration of potassium (K) in the *Sample solution* (mg/mL)

[NOTE—Each mg of potassium is equivalent to 0.02558 mEq of potassium.]

Calculate the percentage of the labeled amount of sodium (Na) in the portion of Injection taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = emission reading ratio of sodium to lithium from the *Sample solution*

R_S = emission reading ratio of sodium to lithium from the *Standard solution*

C_S = concentration of sodium (Na) in the *Standard stock solution* (mg/mL)

C_U = nominal concentration of sodium (Na) in the *Sample solution* (mg/mL)

[NOTE—Each mg of sodium is equivalent to 0.04350 mEq of sodium.]

Acceptance criteria

Potassium: 95.0%–110.0%

Sodium: 95.0%–105.0%

IMPURITIES

Delete the following:

• HEAVY METALS (231)

Sample solution: Transfer a volume of Injection as determined by the calculation below to an appropriate vessel.

Calculate the volume of Injection to use to two significant figures:

$$\text{Result} = 0.2/[(G_K L_K) + (G_D L_D) + (G_S L_S)]$$

G_K = labeled amount of potassium chloride in each 100 mL of Injection (g)

L_K = limit of heavy metals for potassium chloride, 0.001%

G_D = labeled amount of dextrose in each 100 mL of Injection (g)

L_D = limit of heavy metals for dextrose, 0.0005%

G_S = labeled amount of sodium chloride in each 100 mL of Injection (g)

L_S = limit of heavy metals for sodium chloride, 0.0005%

Adjust the volume by evaporation or addition of water to 25 mL, as necessary: it passes the test.

Acceptance criteria: Meets the requirements. (Official 1-Jan-

2018)

• **5-HYDROXYMETHYLFURFURAL AND RELATED SUBSTANCES**

Sample solution: Nominally 2.0 mg/mL of dextrose from Injection in water

Instrumental conditions

Analytical wavelength: 284 nm

Cell: 1 cm

Blank: Water

Analysis

Samples: *Sample solution* and *Blank*

Acceptance criteria: NMT 0.25

SPECIFIC TESTS

• **BACTERIAL ENDOTOXINS TEST (85):** NMT 0.5 USP Endotoxin Units/mL

• **PH (791):** 3.5–6.5

• **OTHER REQUIREMENTS:** It meets the requirements under *Injections and Implanted Drug Products (1)*.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass.

• **LABELING:** The label states the potassium, sodium, and chloride contents in terms of mEq in a given volume. The label also states the total osmolar concentration in mOsmol/L. Where the contents are less than 100 mL, the label alternatively may state the total osmolar concentration in mOsmol/mL.

• **USP REFERENCE STANDARDS (11)**

USP Endotoxin RS

Potassium Chloride, Potassium Bicarbonate, and Potassium Citrate Effervescent Tablets for Oral Solution

» Potassium Chloride, Potassium Bicarbonate, and Potassium Citrate Effervescent Tablets for Oral Solution contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of K and Cl.

Packaging and storage—Preserve in tight containers, protected from excessive heat.

Labeling—The label states the potassium and chloride contents in terms of weight and in terms of milliequivalents. Where Tablets are packaged in individual pouches, the label instructs the user not to open until the time of use.

Identification—One Tablet dissolves in 100 mL of water with effervescence. The collected gas responds to the test for *Bicarbonate (191)*, and the resulting solution responds to the tests for *Potassium (191)*, for *Chloride (191)*, and for *Citrate (191)*.

Uniformity of dosage units (905): meet the requirements for *Weight Variation*.

Assay for potassium—

Standard stock solution and Standard solutions—Prepare as directed in the *Assay* under *Potassium Chloride Oral Solution*.

Assay preparation—Transfer 10 Potassium Chloride, Potassium Bicarbonate, and Potassium Citrate Effervescent Tablets for Oral Solution to a 2000-mL volumetric flask, dissolve in 200 mL of water, swirl until effervescence ceases, dilute with water to volume, and mix. Filter, and quantitatively dilute an accurately measured volume of the filtrate with water to obtain a solution containing 30 µg of potassium per mL. Transfer 5.0 mL of the resulting solution to a 100-mL volumetric flask, add 2.0 mL of sodium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, dilute with water to volume, and mix.

Procedure—Proceed as directed for *Instrumental conditions* and *Analysis* in the *Assay* under *Potassium Chloride Oral Solution*, except use *Assay preparation* instead of *Sample solution*. Calculate the quantity, in mg, of potassium (K) in each Tablet taken by the formula:

$$L(C/D)$$

in which *L* is the labeled quantity, in mg, of potassium in each Tablet, *C* is the concentration, in µg per mL, of potassium in the *Assay preparation*, and *D* is the concentration, in µg per mL, of potassium in the *Assay preparation* on the basis of the labeled quantity in each Tablet and the extent of dilution.

Assay for chloride—Transfer a number of Potassium Chloride, Potassium Bicarbonate, and Potassium Citrate Effervescent Tablets for Oral Solution, equivalent to about 900 mg of chloride, to a 2000-mL volumetric flask. Add about 200 mL of water, swirl until effervescence ceases, dilute with water to volume, and mix. Transfer 25.0 mL of this solution to a 250-mL conical flask, add 50.0 mL of 0.1 N silver nitrate VS and 15 mL of nitric acid, and boil, with constant swirling, until the supernatant is colorless. Cool to room temperature, add sufficient water to make a volume of about 150 mL, add 5 mL of ferric ammonium sulfate TS, and titrate the excess silver nitrate with 0.1 N ammonium thiocyanate VS to a permanent faint brown endpoint. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of Cl. Calculate the quantity, in mg, of chloride (Cl) in each Tablet by dividing the total amount of chloride in the Tablets taken by the number of Tablets taken.

Potassium Chloride in Lactated Ringer's and Dextrose Injection

DEFINITION

Potassium Chloride in Lactated Ringer's and Dextrose Injection is a sterile solution of Calcium Chloride, Potassium Chloride, Sodium Chloride, and Sodium Lactate in Water for Injection. It contains, in each 100 mL, NLT 285.0 mg and NMT 315.0 mg of sodium [as sodium chloride (NaCl)] and anhydrous sodium lactate ($C_3H_5NaO_3$), NLT 4.90 mg and NMT 6.00 mg of calcium (Ca) [equivalent to NLT 18.0 mg and NMT 22.0 mg of calcium chloride ($CaCl_2 \cdot 2H_2O$)], and NLT 231.0 mg and NMT 261.0 mg of lactate ($C_3H_5O_3$) [equivalent to NLT 290.0 mg and NMT 330.0 mg of anhydrous sodium lactate ($C_3H_5NaO_3$)]. It contains NLT 95.0% and NMT 105.0% of the labeled amount of potassium chloride (KCl), NLT 90.0% and NMT 105.0% of the labeled amount of dextrose ($C_6H_{12}O_6 \cdot H_2O$), and NLT 90.0% and NMT 110.0% of the labeled amount of chloride (Cl) [as sodium chloride (NaCl), potassium chloride (KCl), and calcium chloride ($CaCl_2 \cdot 2H_2O$)]. It contains no antimicrobial agents.

IDENTIFICATION

• **A.**

Sample solution: Nominally 50 mg/mL of dextrose from a suitable volume of Injection in water

Analysis: Add a few drops of *Sample solution* to 5 mL of hot alkaline cupric tartrate TS.

Acceptance criteria: A copious red precipitate of cuprous oxide is formed.

• **B. IDENTIFICATION TESTS—GENERAL (191), Calcium and Chloride:** Meets the requirements of the ammonium oxalate test for *Calcium* and the test for *Chloride*

• **C. SODIUM:** The sample imparts an intense yellow color to a nonluminous flame.

• **D. POTASSIUM:** The sample imparts a violet color to a nonluminous flame. Because the presence of small quantities of sodium masks the color, screen out the yellow

color produced by sodium by viewing through a blue filter that blocks the emission at 589 nm (sodium), but is transparent to emission at 404 nm (potassium). [NOTE—Traditionally, cobalt glass has been used, but other suitable filters are commercially available.]

- **E.** The retention time of the lactate peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay for Lactate*.

ASSAY

• CALCIUM

[NOTE—Concentrations of the *Standard solution* and the *Sample solution* may be modified to fit the linear or working range of the atomic absorption spectrophotometer.]

Lanthanum chloride solution: 88.45 g/L of lanthanum chloride prepared as follows. Transfer a suitable quantity of lanthanum chloride to an appropriate volumetric flask. Add 50% of the final flask volume of water. Carefully add 25% of the final flask volume of hydrochloric acid. Mix, and allow to cool. Dilute with water to volume.

Calcium stock solution: 1 mg/mL of calcium (Ca) prepared as follows. Transfer 499.5 mg of primary standard calcium carbonate to a 200-mL volumetric flask, and add 10 mL of water. Carefully add 5 mL of diluted hydrochloric acid, and swirl to dissolve the calcium carbonate. Dilute with water to volume.

Standard solutions: 0.010, 0.015, and 0.020 mg/mL of calcium prepared as follows. To three separate 100-mL volumetric flasks, each containing 5.0 mL of *Lanthanum chloride solution*, add 1.0, 1.5, and 2.0 mL of *Calcium stock solution*, respectively. Dilute the contents of each flask with water to volume.

Sample solution: Transfer 30.0 mL of Injection to a 100-mL volumetric flask containing 5.0 mL of *Lanthanum chloride solution*. Dilute with water to volume.

Blank: Transfer 5.0 mL of *Lanthanum chloride solution* to a 100-mL volumetric flask and dilute with water to volume.

Instrumental conditions

(See *Atomic Absorption Spectroscopy* (852).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Calcium emission line at 422.7 nm

Lamp: Calcium hollow-cathode

Flame: Air-acetylene

Analysis

Samples: *Standard solutions*, *Sample solution*, and *Blank*
Plot the absorbances of the *Standard solutions* versus the concentration, in mg/mL, of calcium, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration (C), in mg/mL, of calcium in the *Sample solution*. Calculate the quantity (mg) of calcium (Ca) in each 100 mL of Injection taken:

$$\text{Result} = C \times D \times F$$

C = concentration of calcium in the *Sample solution*, as determined from the graph (mg/mL)

D = dilution factor of the *Sample solution*, 3.3

F = conversion factor for each 100 mL of Injection, 100 mL

Acceptance criteria: 4.90–6.00 mg of calcium (Ca) in each 100 mL

• CHLORIDE

Sample solution: Transfer 10 mL of Injection into a conical flask. Add 10 mL of glacial acetic acid, 75 mL of methanol, and 3 drops of eosin Y TS.

Titrimetric system

Mode: Direct titration

Titrant: 0.1 N silver nitrate VS

Endpoint detection: Visual

Analysis

Sample: *Sample solution*

Titrate, with shaking, with *Titrant* to a pink endpoint.

Calculate the percentage of the labeled amount of chloride (Cl) in the portion of Injection taken:

$$\text{Result} = V \times N \times (F/W) \times 100$$

V = volume of *Titrant* consumed by the *Sample solution* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 35.45 mg/mEq

W = nominal amount of chloride in the *Sample solution* (mg)

Acceptance criteria: 90.0%–110.0%

• DEXTROSE

Sample solution: Transfer a volume of Injection containing 2–5 g of dextrose to a 100-mL volumetric flask. Add 0.2 mL of 6 N ammonium hydroxide, and dilute with water to volume.

Analysis

Sample: *Sample solution*

Determine the angular rotation in a suitable polarimeter tube (see *Optical Rotation* (781)).

Calculate the percentage of the labeled amount of dextrose ($C_6H_{12}O_6 \cdot H_2O$) in the portion of Injection taken:

$$\text{Result} = [(100 \times a)/(l \times \alpha)] \times (1/C_U) \times (M_{r1}/M_{r2}) \times 100$$

a = observed angular rotation of the *Sample solution* (°)

l = length of the polarimeter tube (dm)

α = midpoint of the specific rotation range for anhydrous dextrose, 52.9°

C_U = nominal concentration of dextrose in the *Sample solution* (g/100 mL)

M_{r1} = molecular weight of dextrose monohydrate, 198.17

M_{r2} = molecular weight of anhydrous dextrose, 180.16

Acceptance criteria: 90.0%–105.0%

• LACTATE

Mobile phase: Add 1 mL of formic acid and 1 mL of dicyclohexylamine per L of water.

System suitability solution: 3 mg/mL each of anhydrous sodium acetate and USP Sodium Lactate RS in water

Standard solution: 3 mg/mL of USP Sodium Lactate RS in water

Sample solution: Use the undiluted Injection.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 10-cm; packing L1

Flow rate: 1 mL/min

Injection volume: 20 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 2 between acetate and lactate, *System suitability solution*

Tailing factor: NMT 2.0 for lactate, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis**Samples:** *Standard solution* and *Sample solution*Calculate the quantity (mg) of lactate ($C_3H_5O_3$) in each 100 mL of Injection taken:

$$\text{Result} = (r_u/r_s) \times C_s \times (M_{r1}/M_{r2}) \times V$$

- r_u = peak response of lactate from the *Sample solution*
 r_s = peak response of lactate from the *Standard solution*
 C_s = concentration of USP Sodium Lactate RS in the *Standard solution* (mg/mL)
 M_{r1} = molecular weight of lactate, 89.07
 M_{r2} = molecular weight of anhydrous sodium lactate, 112.06
 V = volume of the Injection, 100 mL

Acceptance criteria: 231.0–261.0 mg of lactate ($C_3H_5O_3$) in each 100 mL**• POTASSIUM****Solution A:** Suitable nonionic wetting agent (1 in 500)
Standard stock solution A: 100 µg/mL of potassium in water prepared as follows. Dissolve 190.7 mg of potassium chloride, previously dried at 105° for 2 h, in 50 mL of water. Transfer the resulting solution to a 1-L volumetric flask, and dilute with water to volume.**Standard stock solution B:** 10.93 mg/mL of sodium chloride in water**Standard solutions:** 0.005, 0.010, 0.015, and 0.020 mg/mL of potassium prepared as follows. Transfer 10 mL of *Standard stock solution B* to each of four 100-mL volumetric flasks containing 10.0 mL of *Solution A*. To each flask add, respectively, 5.0, 10.0, 15.0, and 20.0 mL of *Standard stock solution A*, and dilute with water to volume.**Sample solution:** Nominally 0.015 mg/mL of potassium prepared as follows. Transfer a suitable portion of Injection into an appropriate volumetric flask. Add 10% of the final flask volume of *Solution A*. Dilute with water to volume.**Blank:** Transfer 10 mL of *Standard stock solution B* to a 100-mL volumetric flask containing 10.0 mL of *Solution A*. Dilute with water to volume.**Instrumental conditions****Mode:** Atomic emission spectrophotometry**Emission wavelength:** 766 nm**Analysis****Samples:** *Standard solutions*, *Sample solution*, and *Blank*
Set a suitable flame photometer for maximum transmittance at a wavelength of 766 nm. Adjust the instrument to zero transmittance with the *Blank*. Adjust the instrument to 100% transmittance with the most concentrated of the *Standard solutions*. Read the percentage transmittance of the other *Standard solutions*, and plot transmittances versus concentration of potassium. From the graph so obtained, read the percentage transmittance of the *Sample solution*.

Calculate the percentage of the labeled amount of potassium chloride (KCl) in the portion of Injection taken:

$$\text{Result} = (C/C_u) \times (M_r/A_r) \times 100$$

- C = concentration of potassium in the *Sample solution*, as determined from the graph (mg/mL)
 C_u = nominal concentration of potassium in the *Sample solution* (mg/mL)
 M_r = molecular weight of potassium chloride, 74.55
 A_r = atomic weight of potassium, 39.10

Acceptance criteria: 95.0%–105.0%**• SODIUM****Solution A:** Suitable nonionic wetting agent (1 in 500)**Standard stock solution:** 100 µg/mL of sodium in water prepared as follows. Dissolve 254.2 mg of sodium

chloride, previously dried at 105° for 2 h, in 50 mL of water. Transfer the resulting solution to a 1-L volumetric flask, and dilute with water to volume.

Standard solutions: 0.005, 0.010, 0.015, and 0.020 mg/mL of sodium prepared as follows. Transfer 10 mL of *Solution A* to each of four 100-mL volumetric flasks. To each flask add, respectively, 5.0, 10.0, 15.0, and 20.0 mL of *Standard stock solution*, and dilute with water to volume.**Sample solution:** Transfer 5 mL of Injection to a 1-L volumetric flask containing 100 mL of *Solution A*. Potassium Chloride in Sodium Chloride Injection

DEFINITION

Potassium Chloride in Sodium Chloride Injection is a sterile solution of Potassium Chloride and Sodium Chloride in Water for Injection. It contains NLT 95.0% and NMT 110.0% of the labeled amounts of potassium (K) and chloride (Cl) and NLT 95.0% and NMT 105.0% of the labeled amount of sodium (Na). It contains no antimicrobial agents.

IDENTIFICATION

• **A. SODIUM:** The sample imparts an intense yellow color to a nonluminous flame.

• **B.**
Analysis: To 2 mL of Injection add 5 mL of sodium cobaltinitrite TS.

Acceptance criteria: A yellow precipitate is formed immediately. If necessary, centrifuge the solution and examine the precipitate (presence of potassium).

• **C. IDENTIFICATION TESTS—GENERAL (191), Chloride:** Meets the requirements

ASSAY

• **POTASSIUM AND SODIUM**

Internal standard solution: 1.04 mg/mL of lithium nitrate in water prepared as follows. Transfer 1.04 g of lithium nitrate to a 1000-mL volumetric flask, add a suitable nonionic surfactant, and dilute with water to volume.

Potassium stock solution: 74.56 mg/mL of potassium chloride (equivalent to 1 mEq/mL of potassium) pre-

pared as follows. Transfer 18.64 g of potassium chloride, previously dried at 105° for 2 h, to a 250-mL volumetric flask. Dilute with water to volume.

Sodium stock solution: 58.44 mg/mL of sodium chloride (equivalent to 1 mEq/mL of sodium) prepared as follows. Transfer 14.61 g of sodium chloride, previously dried at 105° for 2 h, to a 250-mL volumetric flask. Dilute with water to volume.

Standard stock solution: 0.0391 J mg/mL of potassium (K) from the *Potassium stock solution* and 0.02299 J' mg/mL of sodium (Na) from the *Sodium stock solution* prepared as follows. Transfer 0.1 J mL of *Potassium stock solution* and 0.1 J' mL of *Sodium stock solution* to a 100-mL volumetric flask, where J and J' are the labeled amounts (in mEq/L) of potassium and sodium, respectively, in the Injection. Dilute with water to volume.

Standard solution: Transfer 5.0 mL of the *Standard stock solution* to a 500-mL volumetric flask, and dilute with the *Internal standard solution* to volume.

Sample solution: Transfer 5.0 mL of Injection to a 500-mL volumetric flask, and dilute with the *Internal standard solution* to volume.

Instrumental conditions

Mode: Flame photometer

Analytical wavelengths

Potassium: 766 nm

Sodium: 589 nm

Lithium: 671 nm

Blank: *Internal standard solution*

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*
Use the *Blank* to zero the instrument. Concomitantly determine the flame emission readings for the *Standard solution* and the *Sample solution*.

Calculate the percentage of the labeled amount of potassium (K) in the portion of Injection taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = emission reading ratio of potassium to lithium from the *Sample solution*

R_S = emission reading ratio of potassium to lithium from the *Standard solution*

C_S = concentration of potassium (K) in the *Standard solution* (mg/mL)

C_U = nominal concentration of potassium (K) in the *Sample solution* (mg/mL)

[NOTE—Each mg of potassium is equivalent to 0.02558 mEq of potassium.]

Calculate the percentage of the labeled amount of sodium (Na) in the portion of Injection taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = emission reading ratio of sodium to lithium from the *Sample solution*

R_S = emission reading ratio of sodium to lithium from the *Standard solution*

C_S = concentration of sodium (Na) in the *Standard solution* (mg/mL)

C_U = nominal concentration of sodium (Na) in the *Sample solution* (mg/mL)

[NOTE—Each mg of sodium is equivalent to 0.04350 mEq of sodium.]

Acceptance criteria

Potassium: 95.0%–110.0%

Sodium: 95.0%–105.0%

• **CHLORIDE**

Sample solution: Transfer a volume of Injection, equivalent to 55 mg of chloride, to a suitable conical flask.

Add 10 mL of glacial acetic acid, 75 mL of methanol, and 3 drops of eosin Y TS.

Potassium Citrate

$C_6H_5K_3O_7 \cdot H_2O$ 324.41

$C_6H_5K_3O_7$ 306.40

1,2,3-Propanetricarboxylic acid, 2-hydroxy-, tripotassium salt, monohydrate;

Tripotassium citrate monohydrate [6100-05-6].

Anhydrous [866-84-2].

DEFINITION

Potassium Citrate contains NLT 99.0% and NMT 100.5% of potassium citrate ($C_6H_5K_3O_7$), calculated on the dried basis.

IDENTIFICATION

• **A. IDENTIFICATION TESTS—GENERAL,** *Potassium* (191) and *Citrate* (191): A 100-mg/mL solution meets the requirements.

ASSAY• **PROCEDURE**

Sample: 200 mg of Potassium Citrate

Blank: 25 mL of glacial acetic acid

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 N perchloric acid VS

Endpoint detection: Visual

Analysis: Dissolve the *Sample* in 25 mL of glacial acetic acid, add 2 drops of crystal violet TS, and titrate with the *Titrant* to a green endpoint. Perform a *Blank* determination.

Calculate the percentage of potassium citrate ($C_6H_5K_3O_7$) in the *Sample* taken:

$$\text{Result} = [(V_S - V_B) \times N \times F/W] \times 100$$

V_S = *Titrant* volume consumed by the *Sample* (mL)

V_B = *Titrant* volume consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 102.1 mg/mEq

W = *Sample* weight (mg)

Acceptance criteria: 99.0%–100.5% on the dried basis

IMPURITIES**Delete the following:**• **HEAVY METALS, Method I** (231)

Test preparation: Dissolve 2 g in 25 mL of water, and proceed as directed in the chapter, except use glacial acetic acid to adjust the pH.

Acceptance criteria: NMT 10 ppm. (Official 1-Jan-2018)

• **TARTRATE**

Sample: 1 g of Potassium Citrate

Analysis: Dissolve the *Sample* in 1.5 mL of water in a test tube, add 1 mL of 6 N acetic acid, and scratch the walls of the test tube with a glass rod.

Acceptance criteria: No crystalline precipitate is formed.

SPECIFIC TESTS• **ALKALINITY**

Sample solution: Dissolve 1 g of Potassium Citrate in 20 mL of water.

Analysis: To the *Sample solution* add 0.20 mL of 0.10 N sulfuric acid, and add 1 drop of phenolphthalein TS.

Acceptance criteria: The *Sample solution* is alkaline to litmus. No pink color is produced after the addition of phenolphthalein TS.

- **LOSS ON DRYING (731):** Dry a sample at 180° for 4 h: it loses 3.0%–6.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Potassium Citrate Extended-Release Tablets**DEFINITION**

Potassium Citrate Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of potassium citrate as monohydrate ($C_6H_5K_3O_7 \cdot H_2O$).

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Potassium (191)**

Sample solution: Powder 5 Tablets, mix with 20 mL of water, and filter.

Acceptance criteria: The filtrate meets the requirements.

- **B. IDENTIFICATION TESTS—GENERAL, Citrate (191)**

Sample: A portion of powdered Tablets containing about 50 mg of potassium citrate

Acceptance criteria: Meet the requirements

ASSAY• **PROCEDURE**

Mobile phase, Standard solution 1, and Chromatographic system: Proceed as directed under *Assay for Citric Acid/Citrate and Phosphate (345)*.

Sample solution: Weigh and finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to about 200 mg of potassium citrate monohydrate, to a 1000-mL volumetric flask, add about 300 mL of hot water, and shake by mechanical means for 15 min. Allow to cool, dilute with water to volume, and mix. Filter, discarding the first 30 mL of the filtrate. Transfer an aliquot of the clear filtrate to a suitable volumetric flask. Dilute with water and freshly prepared sodium hydroxide solution to obtain a solution containing about 20 µg/mL of citrate in 1 mM sodium hydroxide.

[NOTE—Reserve the remaining filtrate for use in *Content of Potassium*.]

Analysis

Samples: *Standard solution 1* and *Sample solution*

Calculate the percentage of potassium citrate monohydrate ($C_6H_5K_3O_7 \cdot H_2O$) in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times (M_{r1}/M_{r2}) \times 100$$

- r_u = citrate peak area from the *Sample solution*
- r_s = citrate peak area from *Standard solution 1*
- C_s = concentration of citrate in *Standard solution 1* (µg/mL)
- C_u = nominal concentration of potassium citrate in the *Sample solution* (µg/mL)
- M_{r1} = molecular weight of potassium citrate monohydrate, 324.41
- M_{r2} = molecular weight of citrate ($C_6H_5O_7$), 189.10

Acceptance criteria: 90.0%–110.0%

OTHER COMPONENTS• **CONTENT OF POTASSIUM**

Standard stock solution: 19.07 µg/mL of potassium chloride, previously dried at 105° for 2 h, in water. This solution contains 10 µg/mL of potassium.

Standard solutions: Transfer 10.0, 15.0, and 20.0 mL, respectively, to separate 100-mL volumetric flasks of *Standard stock solution*. To each flask, add 2.0 mL of sodium chloride solution (200 mg/mL) and 1.0 mL of hydrochloric acid, and dilute with water to volume. The *Standard solutions* contain 1.0, 1.5, and 2.0 µg/mL of potassium, respectively.

Sample solution: Transfer 3.0 mL of the clear filtrate, reserved from the Assay, to a 100-mL volumetric flask. Add 2.0 mL of sodium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, dilute with water to volume, and mix.

Instrumental conditions

(See *Atomic Absorption Spectroscopy (852)*.)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Potassium emission line at 766.5 nm

Lamp: Potassium hollow-cathode

Flame: Air–acetylene

Blank: Water

Analysis

Samples: *Standard solutions*, *Sample solution*, and *Blank*
Plot the absorbance of the *Standard solutions* versus the concentration of potassium, in µg/mL, and draw the straight line best fitting the three plotted points. From the graph obtained, determine the concentration of potassium in the *Sample solution* (µg/mL).

Calculate the percentage of potassium (K) in the portion of Tablets taken:

$$\text{Result} = (C/C_u) \times [M_r/(3 \times A_r)] \times 100$$

- C = concentration of potassium in the *Sample solution* as determined in this test (µg/mL)
 - C_u = nominal concentration, based on the Assay value, of potassium citrate monohydrate in the *Sample solution* (µg/mL)
 - M_r = molecular weight of potassium citrate monohydrate, 324.41
 - A_r = atomic weight of potassium, 39.10
- Acceptance criteria:** 36.4%–40.2%

PERFORMANCE TESTS• **DISSOLUTION (711)****Test 1**

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Times: 0.5, 1, and 3 h; without *Medium* replacement

[NOTE—Withdraw the same volume at each time point.]

Standard stock solution and Standard solutions: Prepare as directed in the *Content of Potassium*.

Sample solution: Filter the solution under test and dilute quantitatively with *Medium* to obtain a solution containing about 60 µg of potassium citrate per mL. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, add 2.0 mL of sodium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, dilute with water to volume, and mix.

Instrumental conditions

(See *Atomic Absorption Spectroscopy (852)*.)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Potassium emission line at 766.5 nm

Lamp: Potassium hollow-cathode

Flame: Air-acetylene

Blank: Water

Analysis

Samples: Standard solutions, Sample solution, and Blank

Determine the concentration, in $\mu\text{g/mL}$, of potassium in the Sample solution at each time point.

Calculate the percentage of the labeled amount of potassium citrate monohydrate ($\text{C}_6\text{H}_5\text{K}_3\text{O}_7 \cdot \text{H}_2\text{O}$) dissolved at each time point:

At 0.5 h:

$$\text{Result}_1 = C_1 \times V \times R \times F \times 100/L$$

At 1 h:

$$\text{Result}_2 = [C_2 \times (V - V_3) + C_1 \times V_3] \times R \times F \times 100/L$$

At 3 h:

$$\text{Result}_3 = \{C_3 \times [V - 2 \times V_3] + (C_1 + C_2) \times V_3\} \times R \times F \times 100/L$$

C = as C_1 , C_2 , C_3 , concentration of potassium in the Sample solution at each time point ($\mu\text{g/mL}$)

V = volume of Medium, 900 mL

R = ratio of the molecular weight of potassium citrate monohydrate to 3 times the atomic weight of potassium, 2.765

F = dilution factor of the Sample solution

L = label claim (mg/Tablet)

V₃ = volume of sample withdrawn at each time point (mL)

Tolerances: The percentages of the labeled amount of potassium citrate monohydrate ($\text{C}_6\text{H}_5\text{K}_3\text{O}_7 \cdot \text{H}_2\text{O}$) dissolved from the Tablets are NMT 45% (Q) in 30 min, NMT 60% (Q') in 1 h, and NLT 80% (Q'') in 3 h. The requirements are met if the quantities dissolved from the Tablets tested conform to Table 1 instead of the table shown under Dissolution (711).

Table 1

Stage	Number Tested	Acceptance Criteria
S ₁	6	Each unit is within the range between $Q \pm 10\%$ and $Q' \pm 10\%$, and is NLT $Q'' + 5\%$ at the stated times.
S ₂	6	Average of 12 units ($S_1 + S_2$) is within the range between $Q \pm 10\%$ and $Q' \pm 10\%$ and is NLT Q'' ; no unit is outside the range between $Q \pm 15\%$ and $Q' \pm 15\%$, and no unit is less than $Q'' - 5\%$ at the stated times.
S ₃	12	Average of 24 units ($S_1 + S_2 + S_3$) is within the range between $Q \pm 10\%$ and $Q' \pm 10\%$ and is NLT Q'' ; NMT 1 unit is outside the range between $Q \pm 15\%$, NMT 1 unit is outside the range between $Q' \pm 15\%$, and NMT 1 unit is less than $Q'' - 5\%$ at the stated times.

Test 2: If the product complies with this test, the labeling indicates that it meets USP Dissolution Test 2.

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Times: 0.5, 1, 4, and 6 h. Replace the volume withdrawn with the equal volume of Medium preheated to $37 \pm 0.5^\circ$.

Buffer: 3.4 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 2.2.

Mobile phase: Buffer

Standard solution: Prepare a solution of USP Citric Acid RS in Medium as directed in Table 2.

Table 2

Tablet Strength (mg, as potassium citrate monohydrate)	Concentration of Citric Acid (mg/mL)
540	0.35
1080	0.70
1620	1.05

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45- μm pore size, discarding the first 5 mL of filtrate.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm \times 25-cm; 5- μm packing L1

Column temperature: 55°

Flow rate: 1.0 mL/min

Injection volume: 20 μL

System suitability

Sample: Standard solution

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: Standard solution and Sample solution

Determine the concentration, in mg/mL, of potassium citrate monohydrate ($\text{C}_6\text{H}_5\text{K}_3\text{O}_7 \cdot \text{H}_2\text{O}$) in the sample withdrawn from the vessel at each time point:

$$\text{Result} = (r_U/r_S) \times C_S \times (M_{r1}/M_{r2})$$

r_U = citric acid peak area from the Sample solution

r_S = citric acid peak area from the Standard solution

C_S = concentration of USP Citric Acid RS in the Standard solution (mg/mL)

M_{r1} = molecular weight of potassium citrate monohydrate ($\text{C}_6\text{H}_5\text{K}_3\text{O}_7 \cdot \text{H}_2\text{O}$), 324.41

M_{r2} = molecular weight of citric acid ($\text{C}_6\text{H}_8\text{O}_7$), 192.13

Calculate the percentage of the labeled amount of potassium citrate monohydrate ($\text{C}_6\text{H}_5\text{K}_3\text{O}_7 \cdot \text{H}_2\text{O}$) dissolved at each time point:

At 0.5 h:

$$\text{Result}_1 = C_1 \times V \times 100/L$$

At 1 h:

$$\text{Result}_2 = (C_2 \times V + C_1 \times V_3) \times 100/L$$

At 4 h:

$$\text{Result}_3 = [C_3 \times V + (C_1 + C_2) \times V_3] \times 100/L$$

At 6 h:

$$\text{Result}_4 = [C_4 \times V + (C_1 + C_2 + C_3) \times V_3] \times 100/L$$

C = as C_1 , C_2 , C_3 , C_4 concentration of potassium citrate monohydrate in the portion of sample withdrawn at the specified time point (mg/mL)

V = volume of Medium, 900 mL

L = label claim (mg/Tablet)

V₃ = volume of sample withdrawn at each time point (mL)

Tolerances: The percentage of the labeled amount of potassium citrate monohydrate ($\text{C}_6\text{H}_5\text{K}_3\text{O}_7 \cdot \text{H}_2\text{O}$) dissolved at the times specified in Table 3 conform to Acceptance Table 2 in Dissolution (711).

Table 3

Time (h)	Amount Dissolved (%)
0.5	25–50
1	40–65
4	NLT 70
6	NLT 80

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** The label states the amount of potassium citrate as monohydrate ($C_6H_5K_3O_7 \cdot H_2O$) in mEq and in g/ Tablet. The label indicates the *Dissolution Test* with which the product complies.
- **USP REFERENCE STANDARDS (11)**
USP Citric Acid RS

Potassium Citrate and Citric Acid Oral Solution

DEFINITION

Potassium Citrate and Citric Acid Oral Solution is a solution of Potassium Citrate and Citric Acid in a suitable aqueous medium. In each 100 mL, it contains NLT 7.55 g and NMT 8.35 g of potassium (K), and NLT 12.18 g and NMT 13.46 g of citrate ($C_6H_5O_7$), equivalent to NLT 20.9 g and NMT 23.1 g of potassium citrate monohydrate ($C_6H_5K_3O_7 \cdot H_2O$). It also contains NLT 6.34 g and NMT 7.02 g of citric acid monohydrate ($C_6H_8O_7 \cdot H_2O$).

[NOTE—The potassium ion content of Oral Solution is approximately 2 mEq/mL.]

IDENTIFICATION

- **A.**
Sample solution: A dilution of Oral Solution (1 in 40)
Analysis: To 2 mL of the *Sample solution* add 5 mL of sodium cobaltinitrite TS.
Acceptance criteria: A yellow precipitate is formed immediately (presence of potassium).
- **B.**
Sample solution: Oral Solution and hydrochloric acid (1:1)
Analysis: To 2 mL of the *Sample solution* add 10 mL of cobalt–uranyl acetate TS, and stir with a glass rod.
Acceptance criteria: No precipitate or turbidity forms after 15 min, and the *Sample solution* remains clear (absence of sodium).
- **C. IDENTIFICATION TESTS—GENERAL, Citrate (191)**
Sample solution: 3–5 drops of Oral Solution and 20 mL of the mixture of pyridine and acetic anhydride
Acceptance criteria: Meets the requirements

ASSAY

POTASSIUM

Sodium stock solution: 58.44 mg/mL of sodium chloride prepared as follows. Transfer 14.61 g of sodium chloride, previously dried at 105° for 2 h, to a 250-mL volumetric flask, and dilute with water to volume.

Potassium stock solution: 74.56 mg/mL of potassium chloride prepared as follows. Transfer 18.64 g of potassium chloride, previously dried at 105° for 2 h, to a 250-mL volumetric flask, and dilute with water to volume.

Diluent: 1.04 mg/mL of lithium nitrate prepared as follows. Transfer 1.04 g of lithium nitrate to a 1000-mL volumetric flask. Add a suitable nonionic surfactant, then add water to volume. *Diluent* contains 15 mEq of lithium per 1000 mL.

Standard stock solution: 5.844 mg/mL of sodium chloride and 7.456 mg/mL of potassium chloride prepared as follows. Transfer 50 mL each of *Potassium stock solution* and *Sodium stock solution* to a 500-mL volumetric flask, and dilute with water to volume. Each mL of the *Standard stock solution* contains 0.1 mEq of sodium and 0.1 mEq of potassium.

Standard solution: 29.22 µg/mL of sodium chloride and 37.28 µg/mL of potassium chloride prepared as follows. Transfer 50 µL of the *Standard stock solution* to a 10-mL volumetric flask, and dilute with *Diluent* to volume.

Sample stock solution: Transfer a volume of Oral Solution, equivalent to about 2 g of potassium citrate monohydrate, to a 200-mL volumetric flask, and dilute with water to volume.

Sample solution: Transfer 50 µL of the *Sample stock solution* to a 10-mL volumetric flask, and dilute with *Diluent* to volume.

Instrumental conditions

Mode: Flame photometer

Analytical wavelength: Wavelength of maximum emission at about 766 nm

Blank: *Diluent*

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*
Use the *Blank* to zero the instrument. Measure the emission responses for the *Standard solution* and the *Sample solution*.

Calculate the quantity, in g, of potassium (K) in each 100 mL of Oral Solution taken:

$$\text{Result} = [(r_u/r_s) \times (C_s \times F) \times (A_r/M_r)] \times D_1 \times D_2 \times 100$$

r_u = photometer reading of the *Sample solution*

r_s = photometer reading of the *Standard solution*

C_s = concentration of potassium chloride in the *Standard solution* (µg/mL)

F = conversion factor, 1 g per 10^6 µg

A_r = atomic weight of potassium, 39.10

M_r = molecular weight of potassium chloride, 74.55

D_1 = dilution factor of the *Sample stock solution*, 200 mL/V

V = volume of Oral Solution taken to prepare the *Sample stock solution* (mL)

D_2 = dilution factor used to prepare the *Sample solution*, 10 mL per 0.05 mL

Acceptance criteria: In each 100 mL, 7.55–8.35 g of potassium (K)

CITRATE

Mobile phase, Standard preparation 1, and Chromatographic system: Proceed as directed in *Assay for Citric Acid/Citrate and Phosphate (345)*.

Sample solution: Transfer 15 mL of Oral Solution to a suitable volumetric flask, and proceed as directed in *Assay for Citric Acid/Citrate and Phosphate (345)*, *Assay Preparation for Citric Acid/Citrate Assay*.

Analysis

Samples: *Standard preparation 1* and *Sample solution*
Proceed as directed in *Assay for Citric Acid/Citrate and Phosphate (345)*, *Procedure*.

Calculate the quantity, in g, of citrate ($C_6H_5O_7$) in each 100 mL of the Oral Solution taken:

$$\text{Result} = [(r_u/r_s) \times (C_s/F) \times D] - A[M_{r1}/M_{r2}] \times 100$$

r_u = peak response of citrate from the *Sample solution*

r_s = peak response of citrate from *Standard preparation 1*

C_s = concentration of citrate in *Standard preparation 1* (µg/mL)

F = conversion factor, 10^6 µg/g

D = dilution factor of the *Sample solution*

A = quantity of citric acid monohydrate in the Oral Solution determined in the Assay for Citric Acid (g/mL)

M_{r1} = molecular weight of citrate, 189.10

M_{r2} = molecular weight of citric acid monohydrate, 210.14

Acceptance criteria: In each 100 mL, 12.18–13.46 g of citrate ($C_6H_5O_7$), equivalent to NLT 20.9 g and NMT 23.1 g of potassium citrate monohydrate ($C_6H_5K_3O_7 \cdot H_2O$) and NLT 6.34 g and NMT 7.02 g of citric acid monohydrate ($C_6H_8O_7 \cdot H_2O$)

• CITRIC ACID

Sample solution: 15 mL of Oral Solution, diluted with water to 250 mL

Titrimetric system

Mode: Direct titration

Titrant: 0.02 N sodium hydroxide VS

Endpoint detection: Visual

Analysis

Sample: Sample solution

Transfer 5 mL of the Sample solution to a suitable flask. Add 25 mL of water and 5 drops of phenolphthalein TS. Titrate with Titrant to a pink endpoint. Record the buret reading, and calculate the volume of Titrant consumed. Each mL of Titrant is equivalent to 1.401 mg of citric acid monohydrate ($C_6H_8O_7 \cdot H_2O$).

Acceptance criteria: 6.34–7.02 g of citric acid monohydrate ($C_6H_8O_7 \cdot H_2O$) in each 100 mL of Oral Solution

SPECIFIC TESTS

• **PH (791):** 4.9–5.4

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **USP REFERENCE STANDARDS (11)**

USP Citric Acid RS

Potassium Gluconate

$C_6H_{11}KO_7$ 234.25

$C_6H_{11}KO_7 \cdot H_2O$ 252.26

D-Gluconic acid, monopotassium salt;

Monopotassium D-gluconate.

Anhydrous [299–27–4].

Monohydrate [35398–15–3].

DEFINITION

Potassium Gluconate is anhydrous or contains one molecule of water of hydration. It contains NLT 97.0% and NMT 103.0% of anhydrous potassium gluconate ($C_6H_{11}KO_7$), calculated on the dried basis.

IDENTIFICATION

• **A. INFRARED ABSORPTION (197M)**

Delete the following:

• **B. IDENTIFICATION TESTS—GENERAL, Potassium (191):**

Meets the requirements of the flame test. ▲USP40

Add the following:

• **B.** Potassium Gluconate imparts a violet color to a nonluminous flame. Because the presence of small quantities of sodium masks the color, screen out the yellow

color produced by sodium by viewing through a blue filter that blocks emission at 589 nm (sodium) but is transparent to emission at 404 nm (potassium).

[NOTE—Traditionally, cobalt glass has been used, but other suitable filters are commercially available.] ▲USP40

• C. THIN-LAYER CHROMATOGRAPHY

Standard solution: 10 mg/mL of USP Potassium Gluconate RS

Sample solution: 10 mg/mL of Potassium Gluconate

Chromatographic system

(See Chromatography (621), Thin-Layer Chromatography.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel

Application volume: 5 μ L

Developing solvent system: Alcohol, ethyl acetate, ammonium hydroxide, and water (50:10:10:30)

Spray reagent: Dissolve 2.5 g of ammonium molybdate in 50 mL of 2 N sulfuric acid in a 100-mL volumetric flask, add 1.0 g of ceric sulfate, swirl to dissolve, and dilute with 2 N sulfuric acid to volume.

Analysis

Samples: Standard solution and Sample solution

Develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, and dry at 110° for 20 min. Allow to cool, and spray with the Spray reagent. Heat the plate at 110° for about 10 min.

Acceptance criteria: The principal spot of the Sample solution corresponds in color, size, and R_f to that of the Standard solution.

ASSAY

• PROCEDURE

Standard stock solution: Transfer 190.7 mg of potassium chloride, previously dried at 105° for 2 h, to a 1000-mL volumetric flask, add sufficient water to dissolve, and dilute with water to volume. Transfer 100.0 mL of this solution to a 1000-mL volumetric flask, and dilute with water to volume. This solution contains 10 μ g/mL of potassium (equivalent to 19.07 μ g/mL of potassium chloride).

Standard solutions: Transfer 10.0, 15.0, and 20.0 mL of Standard stock solution to separate 100-mL volumetric flasks. Add 2.0 mL of a 200-mg/mL sodium chloride solution and 1.0 mL of hydrochloric acid to each flask. Dilute with water to volume and mix. The Standard solutions contain 1.0, 1.5, and 2.0 μ g/mL of potassium, respectively.

Sample stock solution: 0.18 mg/mL of Potassium Gluconate in water. Filter the solution.

Sample solution: Transfer 5.0 mL of the filtrate from the Sample stock solution to a 100-mL volumetric flask. Add 2.0 mL of a 200-mg/mL sodium chloride solution and 1.0 mL of hydrochloric acid, and dilute with water to volume.

Blank: Water

Instrumental conditions

(See Atomic Absorption Spectroscopy (852).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: 766.5 nm

Lamp: Potassium hollow-cathode

Flame: Air-acetylene

Analysis

Samples: Standard solutions and Sample solution

Determine the absorbances of the Standard solutions and the Sample solution. Plot the absorbances of the Standard solutions versus their concentrations, in μ g/mL, of potassium, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, C_x , in μ g/mL, of potassium in the Sample solution.

Calculate the percentage of potassium gluconate ($C_6H_{11}KO_7$) in the portion of Potassium Gluconate taken:

$$\text{Result} = (C_K/C_U) \times (M_r/A_r) \times 100$$

C_K = determined concentration of potassium in the Sample solution ($\mu\text{g/mL}$)

C_U = concentration of Potassium Gluconate in the Sample solution ($\mu\text{g/mL}$)

M_r = molecular weight of potassium gluconate, 234.25

A_r = atomic weight of potassium, 39.10

Acceptance criteria: 97.0%–103.0% on the dried basis

IMPURITIES

Delete the following:

• HEAVY METALS, Method I (231)

Test preparation: 1.0 g in 10 mL of water. Add 6 mL of 3 N hydrochloric acid, and dilute with water to 25 mL.

Acceptance criteria: NMT 20 ppm (Official 1-Jan-2018)

• REDUCING SUBSTANCES

Sample: 1.0 g of Potassium Gluconate

Blank: 10 mL of water

Titrimetric system

(See *Titrimetry* (541).)

Mode: Residual titration

Titrant: Iodine

Back-titrant: Sodium thiosulfate

Endpoint detection: Visual

Analysis: Transfer the Sample to a 250-mL conical flask, dissolve in 10 mL of water, and add 25 mL of alkaline cupric citrate TS. Cover the flask, boil gently for 5 min, accurately timed, and cool rapidly to room temperature. Add 25 mL of 0.6 N acetic acid, 10.0 mL of *Titrant*, and 10 mL of 3 N hydrochloric acid, and titrate with *Back-titrant*, adding 3 mL of starch TS as the endpoint is approached. Perform the blank determination.

Calculate the percentage of reducing substances (as dextrose) in the portion of the Sample taken:

$$\text{Result} = \{[(V_B - V_S) \times N_A \times F]/W\} \times 100$$

V_B = Back-titrant volume consumed by the Blank (mL)

V_S = Back-titrant volume consumed by the Sample (mL)

N_A = actual Back-titrant normality (mEq/mL)

F = equivalency factor, 27 mg/mEq

W = Sample weight (mg)

Acceptance criteria: NMT 1.0%

SPECIFIC TESTS

• LOSS ON DRYING (731)

Analysis: Dry under vacuum at 105° for 4 h.

Acceptance criteria

Anhydrous: NMT 3.0%

Monohydrate: 6.0%–7.5%

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE: Preserve in tight containers.

• LABELING: Label it to indicate whether it is the anhydrous or the monohydrate form.

• USP REFERENCE STANDARDS (11)

USP Potassium Gluconate RS

Potassium Gluconate Oral Solution

DEFINITION

Potassium Gluconate Oral Solution contains NLT 95.0% and NMT 105.0% of the labeled amount of potassium gluconate ($C_6H_{11}KO_7$).

IDENTIFICATION

Delete the following:

• A. IDENTIFICATION TESTS—GENERAL, Potassium (191):

Meets the requirements of the flame test. ^{USP40}

Add the following:

• A. Oral Solution imparts a violet color to a nonluminous flame. The presence of small quantities of sodium can mask the color unless the yellow color produced by sodium is screened out by viewing through a blue filter that blocks emission at 589 nm (sodium), but is transparent to emission at 404 nm (potassium). [NOTE—Traditionally, cobalt glass has been used, but other suitable filters are commercially available.] ^{USP40}

• B.

Analysis: Evaporate 5 mL on a steam bath to dryness.

Acceptance criteria: A mineral oil dispersion of the residue exhibits an IR absorption maximum in the spectral region of 6.2–6.25 μm (carboxylic acid salt).

ASSAY

• PROCEDURE

Standard stock solution: Transfer 190.7 mg of potassium chloride, previously dried at 105° for 2 h, to a 1000-mL volumetric flask, add sufficient water to dissolve, and dilute with water to volume. Transfer 100.0 mL of this solution to a 1000-mL volumetric flask, and dilute with water to volume. This solution contains 10 $\mu\text{g/mL}$ of potassium (equivalent to 19.07 $\mu\text{g/mL}$ of potassium chloride).

Standard solutions: Transfer 10.0, 15.0, and 20.0 mL of *Standard stock solution* to separate 100-mL volumetric flasks. To each flask add 2.0 mL of a 200-mg/mL sodium chloride solution and 1.0 mL of hydrochloric acid. Dilute with water to volume, and mix. The *Standard solutions* contain 1.0, 1.5, and 2.0 $\mu\text{g/mL}$ of potassium, respectively.

Sample solution: Transfer an accurately measured volume of Oral Solution, equivalent to 1.8 g of potassium gluconate, to a 1000-mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of the solution to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of the resulting solution to a 100-mL volumetric flask, add 2.0 mL of sodium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, dilute with water to volume, and mix.

Blank: Water

PERFORMANCE TESTS

DISSOLUTION (711)

Medium: Water; 900 mL

Apparatus 2: 100 rpm

Time: 45 min

Sample solution: Filtered portion of the solution under test, suitably diluted with *Medium* if necessary

Analysis: Proceed as directed in the *Assay*.

Calculate the percentage of the labeled amount of potassium gluconate ($\text{C}_6\text{H}_{11}\text{KO}_7$) dissolved:

$$\text{Result} = (C \times D \times V/L) \times (M_r/A_r) \times 100$$

C = determined concentration of potassium in the *Sample solution* (mg/mL)

D = dilution factor for the *Sample solution*

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

M_r = molecular weight of potassium gluconate, 234.25

A_r = atomic weight of potassium, 39.10

Tolerances: NLT 75% (Q) of the labeled amount of potassium gluconate ($\text{C}_6\text{H}_{11}\text{KO}_7$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS (11)**
USP Potassium Gluconate RS

Potassium Gluconate and Potassium Chloride Oral Solution

» Potassium Gluconate and Potassium Chloride Oral Solution is a solution of Potassium Gluconate and Potassium Chloride in a suitable aqueous medium. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of potassium (K) and chloride (Cl).

Packaging and storage—Preserve in tight containers.

Labeling—Label it to state the potassium and chloride contents in terms of milliequivalents of each in a given volume of Oral Solution.

Identification—

A: To 2 mL of a dilution of Oral Solution (1 in 40) add 5 mL of sodium cobaltinitrite TS: a yellow precipitate is formed immediately (*presence of potassium*).

B: Evaporate 5 mL on a steam bath to dryness: a mineral oil dispersion of the residue so obtained exhibits an IR absorption maximum in the spectral region between 6.2 and 6.25 μm (*carboxylic acid salt*).

C: It responds to the tests for Chloride (191).

Assay for potassium—

Potassium stock solution—Dissolve in water 0.9535 g of potassium chloride, previously dried at 105° for 2 hours. Transfer to a 500-mL volumetric flask, dilute with water to volume, and mix. This solution contains 1000 μg of potassium per mL.

Standard preparations—To separate 200-mL volumetric flasks transfer 19.0 mL and 25.0 mL, respectively, of *Potassium stock solution*, dilute with water to volume, and mix. The *Standard preparations* contain 95.0 μg and 125.0 μg of potassium per mL, respectively.

Assay preparation—Transfer an accurately measured volume of Oral Solution, equivalent to about 782 mg (20 mEq) of potassium, to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 7.0 mL of the resulting solution to a 500-mL volumetric flask, dilute with water to volume, and mix.

Procedure—Concomitantly determine the absorbances of the *Standard preparations* and the *Assay preparation* at the resonance line of 766.5 nm, with a suitable atomic absorption spectrophotometer (see *Atomic Absorption Spectroscopy* (852)) equipped with a potassium hollow-cathode lamp and an air-acetylene flame, using water as the blank. Plot the absorbances of the *Standard preparations* versus concentration, in μg per mL, of potassium. From the graph so obtained, determine the concentration, C, in μg per mL, of potassium in the *Assay preparation*. Calculate the quantity, in mg, of potassium in each mL of the Oral Solution taken by the formula:

$$(50/7)(C/V)$$

in which V is the volume, in mL, of Oral Solution taken. Each mg of potassium is equivalent to 0.02558 mEq.

Assay for chloride—

Ionic strength adjusting solution—Use 5 M sodium nitrate.

Procedure—Transfer an accurately measured volume of Oral Solution, equivalent to about 100 mg (2.8 mEq) of

chloride, to a suitable beaker. Add 2.0 mL of *Ionic strength adjusting solution* and water to make about 100 mL, and titrate with 0.1 N silver nitrate VS, determining the endpoint potentiometrically, using a silver-sulfide specific ion-selective electrode and a double-junction reference electrode containing potassium nitrate solution (1 in 10). Perform a blank determination, and make any necessary correction. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of chloride (Cl). Each mg of chloride is equivalent to 0.0282 mEq of Cl.

Potassium Gluconate and Potassium Chloride for Oral Solution

» Potassium Gluconate and Potassium Chloride for Oral Solution is a dry mixture of Potassium Gluconate and Potassium Chloride and one or more suitable colors, diluents, and flavors. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of potassium (K) and chloride (Cl).

Packaging and storage—Preserve in tight containers.

Labeling—Label it to state the potassium and chloride contents in terms of milliequivalents. Where packaged in unit-dose pouches, the label instructs the user not to open until the time of use.

Identification—

A: Ignite about 200 mg at a temperature not above 600°, in order to remove all organic matter, cool, dissolve the residue in 10 mL of water, and filter: the filtrate responds to the tests for Potassium (191) and for Chloride (191).

B: A mineral oil dispersion of it exhibits an IR absorption maximum in the spectral region between 6.2 and 6.25 μm (*carboxylic acid salt*).

Minimum fill (755): meets the requirements.

Assay for potassium—

Potassium stock solution—Dissolve in water 0.9535 g of potassium chloride, previously dried at 105° for 2 hours. Transfer to a 500-mL volumetric flask, dilute with water to volume, and mix. This solution contains 1000 μg of potassium per mL.

Standard preparations—To separate 200-mL volumetric flasks transfer 19.0 mL and 25.0 mL, respectively, of the *Potassium stock solution*, dilute with water to volume, and mix. The *Standard preparations* contain 95.0 μg and 125.0 μg of potassium per mL, respectively.

Assay preparation 1 (where it is packaged in unit-dose containers)—Weigh and mix the contents of not less than 20 containers of Potassium Gluconate and Potassium Chloride for Oral Solution. Transfer an accurately weighed portion of the powder, equivalent to about 782 mg (20 mEq) of potassium, to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 7.0 mL of this stock solution to a 500-mL volumetric flask, dilute with water to volume, and mix.

Assay preparation 2 (where it is packaged in multiple-unit containers)—Transfer an accurately weighed portion of Potassium Gluconate and Potassium Chloride for Oral Solution, equivalent to about 780 mg (20 mEq) of potassium, to a 100-mL volumetric flask, dissolve in water, dilute with water to volume, and mix. Transfer 7.0 mL of this stock solution to a 500-mL volumetric flask, dilute with water to volume, and mix.

Procedure—Concomitantly determine the absorbances of the *Standard preparations* and the *Assay preparation* at the resonance line of 766.5 nm, with a suitable atomic absorp-

tion spectrophotometer (see *Atomic Absorption Spectroscopy* (852)) equipped with a potassium hollow-cathode lamp and an air-acetylene flame, using water as the blank. Plot the absorbances of the *Standard preparations* versus concentration, in μg per mL, of potassium. From the graph so obtained, determine the concentration, C , in μg per mL, of potassium in the *Assay preparation*. Calculate the quantity, in mg, of potassium in the portion of Potassium Gluconate and Potassium Chloride for Oral Solution taken by the formula:

$$50C / 7.$$

Each mg of potassium is equivalent to 0.02558 mEq.

Assay for chloride—

Ionic strength adjusting solution—Use 5 M sodium nitrate.

Assay preparation 1 (where it is packaged in unit-dose containers)—Weigh and mix the contents of not less than 20 containers of Potassium Gluconate and Potassium Chloride for Oral Solution. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg (2.8 mEq) of chloride, to a suitable beaker.

Assay preparation 2 (where it is packaged in multiple-unit containers)—Transfer an accurately weighed portion of Potassium Gluconate and Potassium Chloride for Oral Solution, equivalent to about 100 mg (2.8 mEq) of chloride, to a suitable beaker.

Procedure—Add 2.0 mL of *Ionic strength adjusting solution* to *Assay preparation 1* or *Assay preparation 2*, add water to make about 100 mL, and titrate with 0.1 N silver nitrate VS, determining the endpoint potentiometrically, using a silver-sulfide specific ion-selective electrode and a double-junction reference electrode containing potassium nitrate solution (1 in 10). Perform a blank determination, and make any necessary correction. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of chloride (Cl). Each mg of chloride is equivalent to 0.0282 mEq of Cl.

Potassium Gluconate and Potassium Citrate Oral Solution

» Potassium Gluconate and Potassium Citrate Oral Solution is a solution of Potassium Gluconate and Potassium Citrate in a suitable aqueous medium. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of potassium (K).

Packaging and storage—Preserve in tight containers.

Labeling—Label it to state the potassium content in terms of milliequivalents in a given volume of Oral Solution.

Identification—

A: To 2 mL of a dilution of Oral Solution (1 in 40) add 5 mL of sodium cobaltinitrite TS: a yellow precipitate is formed immediately (*presence of potassium*).

B: It responds to the test for *Citrate* (191), 3 to 5 drops of Oral Solution and 20 mL of the mixture of pyridine and acetic anhydride being used.

Assay for potassium—

Potassium stock solution—Dissolve in water 0.9535 g of potassium chloride, previously dried at 105° for 2 hours. Transfer to a 500-mL volumetric flask, dilute with water to volume, and mix. This solution contains 1000 μg of potassium per mL.

Standard preparations—To separate 200-mL volumetric flasks transfer 19.0 mL and 25.0 mL, respectively, of *Potassium stock solution*, dilute with water to volume, and mix.

The *Standard preparations* contain 95.0 μg and 125.0 μg of potassium per mL, respectively.

Assay preparation—Transfer an accurately measured volume of Oral Solution, equivalent to about 782 mg (20 mEq) of potassium, to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 7.0 mL of this solution to a 500-mL volumetric flask, dilute with water to volume, and mix.

Procedure—Concomitantly determine the absorbances of the *Standard preparations* and the *Assay preparation* at the resonance line of 766.5 nm, with a suitable atomic absorption spectrophotometer (see *Atomic Absorption Spectroscopy* (852)) equipped with a potassium hollow-cathode lamp and an air-acetylene flame, using water as the blank. Plot the absorbances of the *Standard preparations* versus concentration, in μg per mL, of potassium. From the graph so obtained, determine the concentration, C , in μg per mL, of potassium in the *Assay preparation*. Calculate the quantity, in mg, of potassium in each mL of the Oral Solution taken by the formula:

$$(50 / 7)(C / V)$$

in which V is the volume, in mL, of Oral Solution taken. Each mg of potassium is equivalent to 0.02558 mEq.

Potassium Gluconate, Potassium Citrate, and Ammonium Chloride Oral Solution

» Potassium Gluconate, Potassium Citrate, and Ammonium Chloride Oral Solution is a solution of Potassium Gluconate, Potassium Citrate, and Ammonium Chloride in a suitable aqueous medium. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of potassium (K) and chloride (Cl).

Packaging and storage—Preserve in tight containers.

Labeling—Label it to state the potassium and chloride contents in terms of milliequivalents of each in a given volume of Oral Solution.

Identification—

A: To 2 mL of a dilution of Oral Solution (1 in 40) add 5 mL of sodium cobaltinitrite TS: a yellow precipitate is formed immediately (*presence of potassium*).

B: It responds to the test for *Citrate* (191), 3 to 5 drops of Oral Solution and 20 mL of the mixture of pyridine and acetic anhydride being used.

C: It responds to the tests for *Ammonium* (191) and for *Chloride* (191).

Assay for potassium—

Potassium stock solution—Dissolve in water 0.9535 g of potassium chloride, previously dried at 105° for 2 hours. Transfer to a 500-mL volumetric flask, dilute with water to volume, and mix. This solution contains 1000 μg of potassium per mL.

Standard preparations—To separate 200-mL volumetric flasks transfer 19.0 mL and 25.0 mL, respectively, of the *Potassium stock solution*, dilute with water to volume, and mix. The *Standard preparations* contain 95.0 μg and 125.0 μg of potassium per mL, respectively.

Assay preparation—Transfer an accurately measured volume of Oral Solution, equivalent to about 782 mg (20 mEq) of potassium, to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 7.0 mL of this solution

to a 500-mL volumetric flask, dilute with water to volume, and mix.

Procedure—Concomitantly determine the absorbances of the *Standard preparations* and the *Assay preparation* at the resonance line of 766.5 nm, with a suitable atomic absorption spectrophotometer (see *Atomic Absorption Spectroscopy* (852)) equipped with a potassium hollow-cathode lamp and an air-acetylene flame, using water as the blank. Plot the absorbances of the *Standard preparations* versus concentration, in µg per mL, of potassium. From the graph so obtained, determine the concentration, C , in µg per mL, of potassium in the *Assay preparation*. Calculate the quantity, in mg, of potassium in each mL of the Oral Solution taken by the formula:

$$(50 / 7)(C / V)$$

in which V is the volume, in mL, of Oral Solution taken. Each mg of potassium is equivalent to 0.02558 mEq.

Assay for chloride—

Ionic strength adjusting solution—Use 5 M sodium nitrate.

Procedure—Transfer an accurately measured volume of Oral Solution, equivalent to about 100 mg (2.8 mEq) of chloride, to a suitable beaker. Add 2.0 mL of *Ionic strength adjusting solution* and water to make about 100 mL, and titrate with 0.1 N silver nitrate VS, determining the endpoint potentiometrically, using a silver-sulfide specific ion-selective electrode and a double-junction reference electrode containing potassium nitrate solution (1 in 10). Perform a blank determination, and make any necessary correction. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of chloride (Cl). Each mg of chloride is equivalent to 0.0282 mEq of Cl.

Potassium Guaiacolsulfonate

$C_7H_7KO_5S \cdot \frac{1}{2}H_2O$	251.30
Benzenesulfonic acid, hydroxymethoxy-, monopotassium salt, hemihydrate;	
Potassium hydroxymethoxybenzenesulfonate hemihydrate [78247-49-1].	
Anhydrous	242.30

DEFINITION

Potassium Guaiacolsulfonate contains NLT 98.0% and NMT 102.0% of potassium guaiacolsulfonate ($C_7H_7KO_5S$), calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197M): 7 µm–13 µm, previously dried at 105° for 18 h
- **B. ULTRAVIOLET ABSORPTION** (197U)
Solution: 50 µg/mL, prepared as directed in the Assay
Acceptance criteria: Meets the requirements
- **C. IDENTIFICATION TESTS—GENERAL, Potassium** (191)
Sample: A 1 in 10 solution
Acceptance criteria: Meets the requirements

ASSAY

• PROCEDURE

Sample stock solution: Transfer about 250 mg of Potassium Guaiacolsulfonate to a 500-mL volumetric flask. Dissolve in 400 mL of water, dilute with water to volume, and mix.

Sample solution: Dilute 10.0 mL of *Sample stock solution* with pH 7.0 phosphate buffer to 100.0 mL, and mix.

Standard solution: About 50 µg/mL of USP Potassium Guaiacolsulfonate RS in the same diluent used for the *Sample solution*

Instrumental conditions

Analytical wavelength: Maximum absorbance at about 279 nm

Cell: 1 cm

Blank: A 1 in 10 mixture of water and pH 7.0 phosphate buffer

Analysis

Samples: *Sample solution* and *Standard solution*

Concomitantly determine the absorbances of the *Sample solution* and *Standard solution*, and calculate the percentage of potassium guaiacolsulfonate ($C_7H_7KO_5S$) in the portion of Potassium Guaiacolsulfonate taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Potassium Guaiacolsulfonate RS in the *Standard solution* (µg/mL)

C_U = concentration of Potassium Guaiacolsulfonate in the *Sample solution* (µg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

IMPURITIES

- **SELENIUM** (291): 0.003%

• SULFATE

Analysis: To 10 mL of a solution (1 in 20) add 5 drops of barium chloride TS, and acidify with hydrochloric acid.

Acceptance criteria: No turbidity is produced in 1 min.

SPECIFIC TESTS

- **WATER DETERMINATION, Method I** (921): 3.0%–6.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.
- **USP REFERENCE STANDARDS** (11)
USP Potassium Guaiacolsulfonate RS

Potassium Iodide

KI	166.00
Potassium iodide [7681-11-0].	

DEFINITION

Potassium Iodide contains NLT 99.0% and NMT 101.5% of KI, calculated on the dried basis.

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Potassium** (191): Meets the requirements
- **B. IDENTIFICATION TESTS—GENERAL, Iodide** (191): Meets the requirements

ASSAY

• PROCEDURE

Sample solution: Dissolve 500 mg of Potassium Iodide in 10 mL of water.

Analysis: Add 35 mL of hydrochloric acid to the *Sample solution*, and titrate with 0.05 M potassium iodate VS until the dark brown solution that is produced becomes pale brown. Add 2–3 drops of amaranth TS, and continue the titration slowly until the red color just changes to yellow. Each mL of 0.05 M potassium iodate is equivalent to 16.60 mg of KI.

Acceptance criteria: 99.0%–101.5% on the dried basis

IMPURITIES

Delete the following:

- **HEAVY METALS (231)**
Sample solution: Dissolve 2.0 g in 25 mL of water.
Acceptance criteria: NMT 10 ppm (Official 1-Jan-2018)
- **IODATE**
Iodate solution: Dilute 1 mL of potassium iodate solution (1 in 2500) with water to 100 mL.
Standard solution: Dissolve 100 mg of Potassium iodide in ammonia- and carbon dioxide-free water, and add 1 mL of Iodate solution to obtain 10 mL of solution. Transfer to a color-comparison tube, add 1 mL of starch TS and 0.25 mL of 1.0 N sulfuric acid, and mix.
Sample solution: Dissolve 1.1 g in sufficient ammonia- and carbon dioxide-free water to obtain 10 mL of solution. Transfer to a color-comparison tube, add 1 mL of starch TS and 0.25 mL of 1.0 N sulfuric acid, and mix.
Acceptance criteria: Any color produced in the Sample solution does not exceed that produced in the Standard solution (NMT 4 µg/g).
- **LIMIT OF NITRATE, NITRITE, AND AMMONIA**
Sample solution: Dissolve 1 g in 5 mL of water.
Analysis: To the Sample solution contained in a test tube of 40-mL capacity add 5 mL of 1 N sodium hydroxide and 200 mg of aluminum wire. Insert a pledget of purified cotton in the upper portion of the test tube, and place a piece of moistened red litmus paper over the mouth of the tube. Heat the test tube and its contents in a steam bath for 15 min.
Acceptance criteria: No blue coloration of the paper is discernible.
- **THIOSULFATE AND BARIUM**
Sample solution: Dissolve 0.5 g in 10 mL of ammonia- and carbon dioxide-free water.
Analysis: Add 2 drops of 2 N sulfuric acid.
Acceptance criteria: No turbidity develops within 1 min.

SPECIFIC TESTS

- **ALKALINITY**
Sample solution: Dissolve 1.0 g of Potassium Iodide in 10 mL of water.
Analysis: Add 0.1 mL of 0.1 N sulfuric acid and 1 drop of phenolphthalein TS to the Sample solution.
Acceptance criteria: No color is produced.
- **LOSS ON DRYING (731)**: Dry a sample at 105° for 4 h: it loses NMT 1.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in well-closed containers.

Potassium Iodide Oral Solution

DEFINITION

Potassium Iodide Oral Solution contains NLT 94.0% and NMT 106.0% of the labeled amount of potassium iodide (KI). [NOTE—If Potassium Iodide Oral Solution is not to be used within a short time, add 0.5 mg of sodium thiosulfate for each g of KI. Products that have data to demonstrate acceptable stability without the addition of thiosulfate are exempt from this requirement. Crystals of potassium iodide may form in Potassium Iodide Oral Solution under normal conditions of storage, especially if refrigerated.]

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL**, Potassium (191) and Iodide (191): Meets the requirements

ASSAY

- **PROCEDURE**
Sample solution: 50 mg/mL of potassium iodide from Oral Solution in water
Analysis: Transfer 10.0 mL of the Sample solution to a 150-mL beaker, and add 40 mL of water, 25 mL of alcohol, and 1.0 mL of 1 N nitric acid. Titrate with 0.1 N silver nitrate VS, using a silver indicator electrode and an appropriate reference electrode. Perform a blank determination (see *Titrimetry* (541)). Each mL of 0.1 N silver nitrate is equivalent to 16.60 mg of KI.
Acceptance criteria: 94.0%–106.0%

PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS (905)**
For Oral Solution packaged in single-unit containers: Meets the requirements
- **DELIVERABLE VOLUME (698)**
For Oral Solution packaged in multiple-unit containers: Meets the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in tight, light-resistant containers.

Potassium Iodide Tablets

DEFINITION

Potassium Iodide Tablets contain NLT 94.0% and NMT 106.0% of the labeled amount of potassium iodide (KI) for Tablets of 300 mg or more, and NLT 92.5% and NMT 107.5% for Tablets of less than 300 mg.

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL**, Potassium (191) and Iodide (191): A filtered solution of powdered Tablets meets the requirements.

ASSAY

- **PROCEDURE**
Sample solution: Transfer an equivalent to 1.2 g of potassium iodide, from finely powdered Tablets (NLT 20), to a 250-mL volumetric flask. Add 100 mL of water, shake for 20 min, and dilute with water to volume. Filter through paper, discarding the first 20 mL of the filtrate.
Analysis: Transfer 100.0 mL of the filtrate, 25 mL of alcohol, and 1.0 mL of 1 N nitric acid to a 200-mL beaker. Titrate with 0.1 N silver nitrate VS, using a silver indicator electrode and an appropriate reference electrode. Perform a blank determination (see *Titrimetry* (541)). Each mL of 0.1 N silver nitrate is equivalent to 16.60 mg of KI.
Acceptance criteria: 94.0%–106.0% of the labeled amount of potassium iodide (KI) for Tablets of 300 mg or more, and 92.5%–107.5% for Tablets of less than 300 mg

PERFORMANCE TESTS

- **DISSOLUTION (711)**
For Uncoated Tablets
Medium: Water; 900 mL
Apparatus 2: 50 rpm
Time: 15 min
Detector: UV 227 nm
Standard solution: Potassium iodide in Medium
Sample solution: Sample per Dissolution (711). Dilute with Medium to a concentration that is similar to the Standard solution.

Tolerances: NLT 75% (Q) of the labeled amount of potassium iodide (KI) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Potassium Iodide Delayed-Release Tablets

DEFINITION

Potassium Iodide Delayed-Release Tablets contain NLT 94.0% and NMT 106.0% of the labeled amount of potassium iodide (KI) for Tablets of 300 mg or more, and NLT 92.5% and NMT 107.5% for Tablets of less than 300 mg.

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Potassium (191) and Iodide (191):** A filtered solution of powdered Tablets meets the requirements.

ASSAY

• PROCEDURE

Sample solution: Transfer an equivalent to 1.2 g of potassium iodide, from finely powdered Tablets (NLT 20), to a 250-mL volumetric flask. Add 100 mL of water, shake for 20 min, and dilute with water to volume. Filter through paper, discarding the first 20 mL of the filtrate. Transfer 100.0 mL of the filtrate, 25 mL of alcohol, and 1.0 mL of 1 N nitric acid to a 200-mL beaker.

Analysis: Transfer 100.0 mL of the filtrate, 25 mL of alcohol, and 1.0 mL of 1 N nitric acid to a 200-mL beaker. Titrate with 0.1 N silver nitrate VS, using a silver indicator electrode and an appropriate reference electrode. Perform a blank determination (see *Titrimetry* (541)). Each mL of 0.1 N silver nitrate is equivalent to 16.60 mg of KI.

Acceptance criteria: 94.0%–106.0% of the labeled amount of potassium iodide (KI) for Tablets of 300 mg or more, and 92.5%–107.5% for Tablets of less than 300 mg

PERFORMANCE TESTS

• DISINTEGRATION (701)

Analysis: Proceed as directed for *Delayed-Release (Enteric-Coated) Tablets*.

Acceptance criteria: The Tablets do not disintegrate after 1 h of agitation in simulated gastric fluid TS, but they disintegrate within 90 min in simulated intestinal fluid TS.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Potassium Nitrate

KNO_3 101.10
Potassium nitrate [7757-79-1].

DEFINITION

Potassium Nitrate contains NLT 99.0% and NMT 100.5% of KNO_3 .

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Potassium (191):** Meets the requirements

- **B. IDENTIFICATION TESTS—GENERAL, Nitrate (191):** Meets the requirements

ASSAY

• PROCEDURE

[NOTE—Use water that is free of carbon dioxide and ammonia.]

Cation-exchange column: Transfer strongly acidic styrene-divinylbenzene cation-exchange resin (16- to 50-mesh) to a 2-cm diameter chromatographic column to a depth of about 20 cm.

Sample solution: 4 mg/mL of Potassium Nitrate in water

Analysis: Pass 100 mL of *Sample solution* through the *Cation-exchange column* at a rate of 5 mL/min, and collect the eluate in a 500-mL conical flask. Wash the resin in the column with water at a rate of 10 mL/min, collecting the eluate in the conical flask. Add 0.15 mL of phenolphthalein TS to the flask, and after 5 min titrate with 0.1 N sodium hydroxide VS to a pink endpoint. Continue collecting the wash from the column, and continue titrating, if necessary, until a 50-mL increment of eluate requires no further addition of sodium hydroxide. Each mL of 0.1 N sodium hydroxide is equivalent to 10.11 mg of KNO_3 .

Acceptance criteria: 99.0%–100.5%

IMPURITIES

- **CHLORIDE AND SULFATE, Chloride (221):** A 500-mg portion shows no more chloride than corresponds to 0.21 mL of 0.020 N hydrochloric acid (0.03%).

- **CHLORIDE AND SULFATE, Sulfate (221)**

Sample solution: 100 mg of Potassium Nitrate in 10 mL of water. Add 15 mL of 6 N hydrochloric acid, and evaporate to dryness on a steam bath. To the residue add 7 mL of 6 N hydrochloric acid, and evaporate to dryness on a steam bath. Dissolve the residue in 35 mL of water and, if necessary, neutralize with hydrochloric acid using a litmus paper indicator. Filter, if necessary, to obtain a clear *Sample solution*.

Acceptance criteria: The *Sample solution* shows no more sulfate than corresponds to 0.10 mL of 0.020 N sulfuric acid (0.1%).

- **ARSENIC, Method I (211):** NMT 3 ppm

- **LEAD (251)**

Sample solution: 500 mg in 20 mL of water

Acceptance criteria: NMT 10 ppm

- **IRON (241):** NMT 10 ppm

Delete the following:

- **HEAVY METALS, Method I (231):** NMT 20 ppm (Official 1-Jan-2018)

• LIMIT OF SODIUM

Standard stock solution: [NOTE—Sodium chloride is previously dried at 105° for 2 h.] 2.542 µg/mL of sodium chloride in water. This solution contains 1.0 µg/mL of sodium.

Sample stock solution: 2 mg/mL of Potassium Nitrate. [NOTE—The concentration of potassium nitrate in this solution may be modified by using a different quantity or by further dilution to bring the absorption response within the working range of the atomic absorption spectrometer.]

Instrumental conditions

(See *Atomic Absorption Spectroscopy* (852).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Sodium emission line of 589 nm

Lamp: Sodium hollow-cathode

Flame: Oxidizing

Blank: Water

Analysis: Transfer 5.0 mL of the *Sample stock solution* to each of three 25-mL volumetric flasks. To these flasks,

respectively, add 0.0, 5.0, and 10.0 mL of the *Standard stock solution*, dilute with water to volume, and mix. These flasks contain 0.0, 0.20, and 0.40 μg of added sodium/mL, respectively. [NOTE—Concentrations of sodium in these solutions may be modified to fit the linear or working range of the atomic absorption spectrophotometer.]

Determine the absorbances of these solutions. Plot the absorbances of the three solutions versus concentration, in $\mu\text{g}/\text{mL}$ of added sodium, draw the straight line best fitting the plotted points, and extrapolate the line until it intercepts the concentration axis. From the graph determine the concentration, C , in $\mu\text{g}/\text{mL}$ of sodium, of the solution containing 0.0 mL of the *Standard stock solution*.

Calculate the percentage of sodium in the portion of Potassium Nitrate taken by multiplying C by 0.25.

Acceptance criteria: NMT 0.1%

• LIMIT OF NITRITE

Solution A: 1 mg/mL of sulfanilic acid

Solution B: 1 mg/mL of *N*-(1-naphthyl)ethylenediamine dihydrochloride. [NOTE—When stored in a low-actinic glass bottle, this solution may be used for 1 week.]

Standard stock solution: 15 $\mu\text{g}/\text{mL}$ of sodium nitrite (10 $\mu\text{g}/\text{mL}$ of nitrite)

Standard solutions: Transfer 1.0 and 2.0 mL of *Standard stock solution* to separate 50-mL beakers, and add 19 and 18 mL of water to the respective beakers.

Sample solution: Transfer 4.0 g of Potassium Nitrate to a 50-mL beaker, add 20 mL of water, and swirl to dissolve.

Analysis: To the beakers containing the *Standard solutions* and the *Sample solution* add 5.0 mL of *Solution A* and 5.0 mL of diluted hydrochloric acid, and allow to stand for 3 min. Add 5.0 mL of *Solution B* to each beaker, mix, and allow to stand for 15 min. Determine the absorbances of the solutions at 550 nm.

Acceptance criteria: The absorbance of the solution from the *Sample solution* does not exceed that of the solution from the *Standard solution* containing 20 μg of nitrite (5 $\mu\text{g}/\text{g}$).

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Potassium Nitrate Solution

» Potassium Nitrate Solution contains not less than 98.0 percent and not more than 102.0 percent of the labeled amount of KNO_3 .

Packaging and storage—Preserve in tight containers.

Identification—It responds to the tests for *Potassium* (191) and for *Nitrate* (191).

Chloride (221)—An accurately measured portion of Solution, equivalent to 500 mg of potassium nitrate, shows no more chloride than corresponds to 0.21 mL of 0.020 N hydrochloric acid (0.03%, based on the potassium nitrate content of the Solution).

Sulfate (221)—Dilute an accurately measured portion of Solution, equivalent to 100 mg of potassium nitrate, with water to obtain 10 mL of solution, add 15 mL of 6 N hydrochloric acid, and evaporate to dryness on a steam bath. To the residue so obtained add 7 mL of 6 N hydrochloric acid, and evaporate to dryness on a steam bath. Dissolve the residue so obtained in about 35 mL of water and, if necessary, neutralize with hydrochloric acid using litmus paper indica-

tor. Filter, if necessary, to obtain a clear test solution. This test solution shows no more sulfate than corresponds to 0.10 mL of 0.020 N sulfuric acid (0.1%, based on the potassium nitrate content of the Solution).

Arsenic, Method I (211): 3 ppm, based on the potassium nitrate content of the Solution, an accurately measured portion of Solution, equivalent to 1.0 g of potassium nitrate, being tested.

Lead—Dilute an accurately measured portion of Solution, equivalent to 500 mg of potassium nitrate, with water to obtain 20 mL of test solution. This test solution contains not more than 5 μg of lead (corresponding to not more than 0.001% of Pb, based on the potassium nitrate content of the Solution) when tested as directed under *Lead* (251).

Delete the following:

• **Heavy metals, Method I** (231): 0.002%, based on the potassium nitrate content of the Solution. (Official 1-Jan-2018)

Iron (241): not more than 0.001%, based on the potassium nitrate content of the Solution, an accurately measured portion of Solution, equivalent to 1.0 g of potassium nitrate, being tested.

Limit of sodium—

Stock test solution—Transfer an accurately measured portion of Solution, equivalent to 1.0 g of potassium nitrate, to a 500-mL volumetric flask, dilute with water to volume, and mix. [NOTE—The concentration of potassium nitrate in this solution may be modified by using a different quantity or by further dilution to bring the absorption response within the working range of the atomic absorption spectrophotometer.]

Stock standard solution—Proceed as directed in the *Limit of sodium* test under *Potassium Nitrate*.

Procedure—Proceed as directed in the *Limit of sodium* test under *Potassium Nitrate*. Calculate the percentage of sodium in the portion of Solution taken by multiplying C by 0.25: the limit is 0.1%, based on the potassium nitrate content of the Solution.

Limit of nitrite—

Sulfanilic acid solution, N-(1-Naphthyl)ethylenediamine dihydrochloride solution, and *Standard solutions*—Proceed as directed in the *Limit of nitrite* test under *Potassium Nitrate*.

Test solution—Transfer an accurately measured portion of the Solution, equivalent to 4.0 g of potassium nitrate, to a 50-mL beaker, add sufficient water to obtain 20 mL of solution, and mix.

Procedure—Proceed as directed in the *Limit of nitrite* test under *Potassium Nitrate*. The absorbance of the solution from the *Test solution* does not exceed that of the solution from the *Standard solution* containing 20 μg of nitrite (5 μg per g, based on the potassium nitrate content of the Solution).

Assay—[NOTE—Use water that is carbon dioxide- and ammonia-free.]

Cation-exchange column—Transfer strongly acidic styrene-divinylbenzene cation-exchange resin (16- to 50-mesh) to a 2-cm diameter chromatographic column to a depth of about 20 cm.

Procedure—Transfer an accurately measured portion of Solution, equivalent to about 400 mg of potassium nitrate, to a beaker and add sufficient water to obtain 100 mL of solution. Proceed as directed in the *Assay* under *Potassium Nitrate* beginning with "Pass this solution through" Each mL of 0.1 N sodium hydroxide is equivalent to 10.11 mg of KNO_3 .

Potassium Perchlorate

» Potassium Perchlorate contains not less than 99.0 percent and not more than 100.5 percent of KClO_4 , calculated on the dried basis.

Caution: Great care should be taken in handling Potassium Perchlorate in solution or in the dry state, as explosions may occur if it is brought into contact with organic or other readily oxidizable substances.

Packaging and storage—Preserve in well-closed containers.

Identification—

A: Ignite a small portion of a solution (1 in 10) on a platinum wire in a nonluminous flame: a transient violet color is imparted to the flame.

B: Add a few drops of methylene blue solution (1 in 1000) to the solution (1 in 10): a violet-colored precipitate is formed.

pH (791): between 5.0 and 6.5, in a 0.1 M solution.

Loss on drying (731)—Dry it over silica gel for 12 hours: it loses not more than 0.5% of its weight.

Insoluble substances—Dissolve 20 g in 150 mL of warm water, pass through a tared medium-porosity filtering crucible, and wash with three 50-mL portions of warm water. Dry the residue at 105° for 3 hours: the weight of the residue does not exceed 1 mg (0.005%).

Chloride (221)—A 5.0-g portion shows no more chloride than corresponds to 0.20 mL of 0.020 N hydrochloric acid (0.003%).

Delete the following:

• **Heavy metals, Method I** (231): 0.001%. • (Official 1-Jan-2018)

Limit of sodium—Ignite a small portion of a solution (1 in 10) on a platinum wire in a nonluminous flame: no pronounced yellow color is imparted to the flame.

Assay—

Mobile phase—Transfer 16.6 g of phthalic acid to a 100-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix. Transfer 10.0 mL of this solution to a 1000-mL flask, dilute with water to volume, and mix. Adjust with about 450 mg of lithium hydroxide to a pH of 4.5, filter, and degas.

Standard preparation—Transfer about 50 mg of potassium perchlorate, accurately weighed, to a 50-mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix to obtain a solution having a known concentration of about 0.1 mg per mL.

Assay preparation—Using about 50 mg of Potassium Perchlorate, accurately weighed, proceed as directed for the *Standard preparation*.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a conductivity detector and a 4.6-mm \times 7.5-cm column that contains 6- μ m packing L23. The flow rate is about 1.2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quan-

tity, in mg, of KClO_4 in the portion of Potassium Perchlorate taken by the formula:

$$500C(r_u / r_s)$$

in which *C* is the concentration, in mg per mL, of potassium perchlorate in the *Standard preparation*; and r_u and r_s are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Potassium Perchlorate Capsules

» Potassium Perchlorate Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of potassium perchlorate (KClO_4).

Packaging and storage—Preserve in tight, light-resistant containers.

Identification—

A: Dissolve the contents of 5 Capsules in 20 mL of water, and filter: the filtrate responds to the tests for *Potassium* (191).

B: Add a few drops of methylene blue solution (1 in 1000) to the filtrate obtained in *Identification test A*: a violet-colored precipitate is obtained.

Disintegration (701): 30 minutes, 1 N hydrochloric acid maintained at $37 \pm 2^\circ$ being used as the immersion fluid.

Uniformity of dosage units (905): meet the requirements for *Content Uniformity*.

Assay—

Mobile phase, Standard preparation, and Chromatographic system—Proceed as directed in the *Assay* under *Potassium Perchlorate*.

Assay preparation—Mix the contents of not less than 10 Capsules, and transfer an accurately weighed portion of the mixed powder, equivalent to about 200 mg of potassium perchlorate, to a 200-mL volumetric flask, dilute with water to volume, and mix. Pass through a filter having 0.22- μ m pore size, transfer 10.0 mL of the clear filtrate to a 100-mL volumetric flask, dilute with water to volume, and mix.

Procedure—Proceed as directed in the *Assay* under *Potassium Perchlorate*. Calculate the quantity, in mg, of potassium perchlorate (KClO_4) in the portion of Capsules taken by the formula:

$$2000C(r_u / r_s)$$

in which the terms are as defined therein.

Potassium Permanganate

KMnO_4 158.03
Permanganic acid (HMnO_4), potassium salt;
Potassium permanganate (KMnO_4) [7722-64-7].

DEFINITION

Potassium Permanganate contains NLT 99.0% and NMT 100.5% of potassium permanganate (KMnO_4), calculated on the dried basis.

[CAUTION]—Observe great care in handling Potassium Permanganate, because dangerous explosions may occur if it is brought into contact with organic or other readily oxidizable substances, either in solution or in the dry state.]

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Permanganate (191):**
A solution of it is deep violet-red when concentrated and pink when highly diluted.

ASSAY• **PROCEDURE**

Sample: 1000 mg of Potassium Permanganate
Titrimetric system

Mode: Residual titration

Titrant: 0.03 N potassium permanganate VS

Endpoint detection: Visual

Analysis: For each mg of Potassium Permanganate taken, add 2.13 mg of sodium oxalate, previously dried at 110° to constant weight, to a 500-mL conical flask. Add 150 mL of water and 20 mL of 7 N sulfuric acid, and heat to 80°. Titrate the excess oxalic acid with *Titrant*. Calculate the percentage of potassium permanganate (KMnO₄) in the portion of Potassium Permanganate taken:

$$\text{Result} = [(F_1 \times W_S) - (V_S \times N \times F_2)] \times (100/W)$$

F_1 = equivalency factor, 0.4718 mg of potassium permanganate per mg of sodium oxalate

W_S = weight of sodium oxalate taken (mg)

V_S = *Titrant* volume consumed by the *Sample* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F_2 = equivalency factor, 31.61 mg of potassium permanganate per mEq

W = *Sample* weight (mg)

Acceptance criteria: 99.0%–100.5% on the dried basis

IMPURITIES• **INSOLUBLE SUBSTANCES**

Sample: 2.0 g

Analysis: Dissolve the *Sample* in 150 mL of water that previously has been warmed to steam-bath temperature, and filter immediately through a tared, medium-porosity filtering crucible. Wash the filter with three 50-mL portions of the warm water, and dry the filtering crucible and the residue at 105° for 3 h.

Acceptance criteria: 0.2%; NMT 4 mg of residue is obtained.

SPECIFIC TESTS• **LOSS ON DRYING (731)**

Analysis: Dry over silica gel for 18 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Dibasic Potassium Phosphate

K₂HPO₄

174.18

Phosphoric acid, dipotassium salt;
Dipotassium hydrogen phosphate [7758-11-4].

DEFINITION

Dibasic Potassium Phosphate contains NLT 98.0% and NMT 100.5% of K₂HPO₄, calculated on the dried basis.

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Potassium (191)**

Sample solution: 1 in 20

Acceptance criteria: Meets the requirements

- **B. IDENTIFICATION TESTS—GENERAL, Phosphate (191)**

Sample solution: 1 in 20

Acceptance criteria: Meets the requirements

ASSAY• **PROCEDURE**

Sample: 5.2 g

Sample solution: Transfer the *Sample* to a 250-mL beaker. Add 50 mL of water and 40.0 mL of 1 N hydrochloric acid, and stir until dissolved.

Blank: Transfer 40.0 mL of 1 N hydrochloric acid to a 250-mL beaker. Add 50 mL of water.

Analysis: Titrate the *Blank* with 1 N sodium hydroxide VS, and record the volume of 1 N sodium hydroxide VS consumed. Titrate the excess acid in the *Sample solution* with 1 N sodium hydroxide VS to the inflection point at pH 4, and record the buret reading. Subtract this buret reading from that of the blank, and designate the volume of 1 N sodium hydroxide VS resulting from this subtraction as A. Continue the titration with 1 N sodium hydroxide VS to the inflection point at pH 8.8, record the buret reading, and calculate the volume (B) of 1 N sodium hydroxide required in the titration between the two inflection points (pH 4–8.8). Where A is equal to or less than B, each mL of the volume A of 1 N sodium hydroxide is equivalent to 174.2 mg of K₂HPO₄. Where A is greater than B, each mL of the volume 2B – A of 1 N sodium hydroxide is equivalent to 174.2 mg of K₂HPO₄.

Acceptance criteria: 98.0%–100.5% on the dried basis

IMPURITIES• **INSOLUBLE SUBSTANCES**

Sample solution: Dissolve 10 g in 100 mL of hot water.

Analysis: Filter the *Sample solution* through a tared filtering crucible, wash the insoluble residue with hot water, and dry at 105° for 2 h.

Acceptance criteria: The weight of the residue is NMT 20 mg (NMT 0.2%).

• **CARBONATE**

Sample: 1 g

Analysis: Add 3 mL of water and 2 mL of 3 N hydrochloric acid to the *Sample*.

Acceptance criteria: NMT a few bubbles are evolved.

• **CHLORIDE AND SULFATE, Chloride (221)**

Sample: 1.0 g

Acceptance criteria: Shows no more chloride than corresponds to 0.40 mL of 0.020 N hydrochloric acid (NMT 0.03%)

• **CHLORIDE AND SULFATE, Sulfate (221)**

Sample: 0.20 g

Acceptance criteria: Shows no more sulfate than corresponds to 0.20 mL of 0.020 N sulfuric acid (NMT 0.1%)

• **ARSENIC, Method I (211):** NMT 3 ppm• **IRON**

Sample solution: Dissolve 0.33 g in 10 mL of water.

Analysis: To the *Sample solution* add 6 mL of hydroxylamine hydrochloride solution (1 in 10) and 4 mL of orthophenanthroline solution prepared by dissolving 1 g of orthophenanthroline in 1000 mL of water containing 1 mL of 3 N hydrochloric acid, and dilute with water to 25 mL.

Acceptance criteria: Any red color produced within 1 h is not darker than that of a control prepared from 1 mL of *Standard Iron Solution* (see *Iron (241)*): NMT 30 ppm.

- **SODIUM:** A solution (1 in 10) tested on a platinum wire imparts no pronounced yellow color to a nonluminous flame.

Delete the following:• **HEAVY METALS, Method I (231)**

Sample stock solution: Dissolve a portion equivalent to 4.2 g of K_2HPO_4 in enough water to make 50 mL.

Analysis: Transfer 12 mL of the *Sample stock solution* to a 50-mL color-comparison tube (*Test Preparation*).

Transfer 11 mL of the *Sample stock solution* to a second color-comparison tube containing 1.0 mL of *Standard Lead Solution* (*Monitor Preparation*). Transfer 1.0 mL of *Standard Lead Solution* and 11 mL of water to a third color-comparison tube (*Standard Preparation*). Proceed as directed for *Procedure*, omitting the dilution to 50 mL.

Acceptance criteria: NMT 10 ppm • (Official 1-Jan-2018)

• **LIMIT OF FLUORIDE**

[NOTE—Prepare and store all solutions in plastic containers.]

Buffer: 294 g/L of sodium citrate dihydrate in water

Standard stock solution: 1.1052 mg/mL of USP Sodium Fluoride RS in water

Standard solution: Transfer 20.0 mL of *Standard stock solution* to a 100-mL volumetric flask containing 50.0 mL of *Buffer*, and dilute with water to volume. Each mL of this solution contains 100 µg of fluoride ion.

Sample: 2.0 g

Electrode system: Use a fluoride-specific ion-indicating electrode and a silver-silver chloride reference electrode connected to a pH meter capable of measuring potentials with a minimum reproducibility of ± 0.2 mV (see pH (791)).

Standard response line: Transfer 50.0 mL of *Buffer* and 2.0 mL of hydrochloric acid to a beaker, and add water to make 100 mL. Add a plastic-coated stirring bar, insert the electrodes into the solution, stir for 15 min, and read the potential, in mV. Continue stirring, and at 5-min intervals add 100, 100, 300, and 500 µL of *Standard solution*, reading the potential 5 min after each addition. Plot the logarithms of the cumulative fluoride ion concentrations (0.1, 0.2, 0.5, and 1.0 µg/mL) versus potential, in mV.

Analysis: Transfer the *Sample* to a beaker containing a plastic-coated stirring bar. Add 20 mL of water and 2.0 mL of hydrochloric acid, and stir until dissolved. Add 50.0 mL of *Buffer* and sufficient water to make 100 mL (*Sample solution*). Rinse and dry the electrodes, insert them into the *Sample solution*, stir for 5 min, and read the potential, in mV. From the measured potential and the *Standard response line* determine the concentration, C , in µg/mL, of fluoride ion in the *Sample solution*. Calculate the percentage of fluoride ion in the portion of Dibasic Potassium Phosphate taken:

$$\text{Result} = (C/C_U) \times 100$$

C = concentration of fluoride ion in the *Sample solution* (µg/mL), as defined above

C_U = concentration of the *Sample solution* (µg/mL)

Acceptance criteria: NMT 0.001%

• **LIMIT OF MONOBASIC OR TRIBASIC SALT**

Sample solution: Dissolve 3 g in 30 mL of water, and cool to 20°.

Analysis: Add 3 drops of thymol blue TS to the *Sample solution*.

Acceptance criteria: A blue color is produced, which is changed to yellow (with a greenish tinge) by the addition of NMT 0.4 mL of 1 N hydrochloric acid.

SPECIFIC TESTS

• **pH (791):** 8.5–9.6, in a solution (1 in 20)

• **Loss on Drying (731):** Dry a sample at 105° to constant weight: it loses NMT 1.0% of its weight.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **USP REFERENCE STANDARDS (11)**
USP Sodium Fluoride RS

Potassium Phosphates Injection

» Potassium Phosphates Injection is a sterile solution of Monobasic Potassium Phosphate and Dibasic Potassium Phosphate in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amounts of monobasic potassium phosphate (KH_2PO_4) and dibasic potassium phosphate (K_2HPO_4). It contains no bacteriostat or other preservative.

Packaging and storage—Preserve in single-dose containers, preferably of Type I glass.

Labeling—The label states the potassium content in terms of milliequivalents in a given volume, and states also the elemental phosphorus content in terms of millimoles in a given volume. Label the Injection to indicate that it is to be diluted to appropriate strength with water or other suitable fluid prior to administration, and that once opened any unused portion is to be discarded. The label states also the total osmolar concentration in mOsmol per L. Where the contents are less than 100 mL, or where the label states that the Injection is not for direct injection but is to be diluted before use, the label alternatively may state the total osmolar concentration in mOsmol per mL.

USP Reference standards (11)—

USP Endotoxin RS

Identification—It responds to the tests for *Potassium* (191) and for *Phosphate* (191).

Bacterial Endotoxins Test (85)—It contains not more than 1.10 USP Endotoxin Units per mg of potassium phosphates.

Particulate Matter in Injections (788): meets the requirements for small-volume Injections.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay for monobasic potassium phosphate—Transfer an accurately measured volume of Injection, equivalent to about 300 mg of monobasic potassium phosphate, to a 100-mL beaker, and dilute with water to about 50 mL. Place the electrodes of a suitable pH meter in the solution, and titrate with 0.1 N sodium hydroxide VS to the inflection point to a pH of about 9.1. Each mL of 0.1 N sodium hydroxide is equivalent to 13.61 mg of KH_2PO_4 .

Assay for dibasic potassium phosphate—Transfer an accurately measured volume of Injection, equivalent to about 300 mg of dibasic potassium phosphate, to a 100-mL beaker, and dilute with water to about 50 mL. Place the electrodes of a suitable pH meter in the solution, and titrate with 0.1 N hydrochloric acid VS to the inflection point to a pH of about 4.2. Each mL of 0.1 N hydrochloric acid is equivalent to 17.42 mg of K_2HPO_4 .
